a

absorbers—shock or vibration
machinery
see vibration control:—machinery 11
pressure line
see vibration control:—pressure line....30

accelerators
see admixtures:—accelerators—concrete or mortar.................9

acidproofing
see admixtures:—acid-resistant—concrete
coatings and toppings—concrete or masonry:—acid-resistant 9

acoustical materials . . 11
baffles
blanket type
board type
carpeting
see floor coverings:—carpets and rugs...13
fastening devices for—adhesives, clips, nails, etc.
fireproofing
panel type
plaster
plaster—aggregates for
sprayed-on
tile form—concrete aggregate block
tile form—cork, fiber or plastic
tile form—fabricated stone
tile form—metal or mineral

adhesives
see specific application as:
fastening systems:—adhesives 2
curtain walls:—insulation, adhesives, caulking and sealing compounds for 3
building insulation:—adhesives for; insulation:—adhesives for; high temperature insulation:—adhesives for; low temperature insulation:—adhesives for 10
acoustical materials:—fastening devices for—adhesives, clips, nails, etc. 11
wallboard accessories:—adhesives for.12
floor coverings—specific material:—adhesives for; wall coverings—specific material:—adhesives for.......13
surfacing and paneling:—adhesives for 14

admixtures 9
accelerators—concrete or mortar
acid-resistant—concrete
air-entraining
antifreeze—concrete or mortar
curing—concrete
efflorescence-checking—concrete or mortar
hardeners and densifiers—concrete
metal powder or aggregates—concrete
plasticizers—concrete or mortar
water-reducing—concrete or mortar
water-repellent—concrete or mortar

admixtures—concrete or mortar 4
[see also admixtures ....9]

aggregates—concrete 4
abrasive
acoustic or insulating
air-cooled slag
blast furnace slag
expanded slag
lightweight
metallic
perlite
vermiculite

aggregates—plaster 12
perlite
vermiculite

air conditioners 31
[see also specific items as:
blowers—centrifugal or axial:—ventilating or exhaust; coolers; dehumidifiers; fans; filters—air ....31]
air-cooled
central plant (remote source unit)
coolers for
enclosures for
floor, ceiling or wall unit
heaters for
packaged
see air conditioners:—floor, ceiling or wall unit 31
water-cooled
window unit

alarm systems—burglar or fire 34

amplifiers 34

anchors 2
beam or joist
bolt
buck
cavity wall
expansion bolt
furring
furring—adjustable wall
[see also lath and plaster work accessories:—adjustable anchors—wall furring ....12]
masonry
partition
powder-actuated fastening
see fastening systems:—powder-actuated..2
screw
sleeper
slot and slots for
wall

angles
see structural shapes.......................2

antifreeze compounds
see admixtures:—antifreeze—concrete or mortar 9

arches 2

area walls. 6

armored concrete. . . . 6

ash cans 24
trucks for

ash hoists 24
electric
hand-powered

asphalt
basic 8
[see also roofing:—built-up; shingles:—asphalt 8
floor coverings:—asphalt tile; flooring—asphalt ....13]
emulsion 9
sealers for 9
[see also sealers, sealing compounds:—asphalt ....15]

astragals
see weatherstripping:—adjustable astragals for 19

products

aviaries 2

awnings 19
bars and hardware for
canvas or fabric
louvered
metal
operating mechanisms for
rollers for
store front—built-in

b

backstops 23
baseball or tennis
basketball

balconies
see ornamental metalwork 6

ballasts 33
fluorescent lighting
mercury vapor lighting

balustrades
see ornamental metalwork; railings. 6

band shells 8

bank equipment 23
burglar alarms
[see also alarm systems—burglar or fire 34]
cash drawers, record cabinets, etc.
counters and check desks
deposit boxes
drive-in or walk-in facilities
night and 24-hour depositories
safes
see safes 23
vault doors
vault ventilators
wire screens
see partitions:—wire; wirework:—
specialties .22

barrels
storage racks for
see racks:—barrel, reel or merchandise
storage 23

barriers and bumpers—parking
see parking equipment:—barriers and
bumpers 23

bases—cove, wall
see specific material or product as:
floor coverings; flooring; wall coverings 13

bathroom accessories 27
ceramic
metal
porcelain enamel
vitreous china

bathroom cabinets and mirrors 27
with lighting fixtures

bathtubs 27
enclosures for
fittings for
see plumbing fittings, valves, etc.:—
bathtub, lavatory, sink, toilet,
urinal, etc. 27
hangers and accessories for

battery chargers 32

beam and girder fireproofing 12

beams, girders and rafters 2
[see also joists; structural shapes . . . . .2]
aluminum
concrete—precast, prestressed
steel
steel—accessories for—anchors, bridging, etc.
steel—welded connectors for
wood

bells—tower
see church equipment:—bells and carillons 23

bells, buzzers, chimes 34

belting—wire
see wirework:—conveyor belts 22

bench legs 6

benches
see locker room equipment:—benches;
seating; work benches 23

beverage dispensers—hot or cold
see food service equipment—commercial
or institutional:—dispensers—milk,
coffee, tea, etc. 26
coolers—drinking water:—hot or cold
water 30

billiard room equipment 23

blackboards
see chalkboards 23

blanket warmers
see hospital equipment:—warming cabinets 23

blasting compounds . .9

bleachers and grandstands 23
closed deck
operators for
permanent
permanent—folding or telescopic
portable

bleaches—wood 15

blinds 19
horizontal
see venetian blinds 19
vertical

blocks—glass
see glass blocks. 7

blowers—centrifugal or axial . .31
forced draft (light duty)
pressure or volume (heavy duty)
ventilating or exhaust

bluestone
see sandstone 4

boiler-burner units . .31

boilers 31
coal-fired
electric—hot water
fire tube
gas-fired
high pressure
oil-fired
packaged
see boiler-burner units 31
safety and control devices for
smokeless
support brackets for
water tube

bolts 2
expansion
[see also anchors:—expansion bolt . . . . .2]
structural

bonding compounds
see coatings and toppings—concrete or
masonry:—bond for 9

bookcases 23

bookstacks
see library equipment:—bookstacks 23

bowling alley equipment 23
planning and contractors

boxes—conduit
see conduit—electrical:—fittings and supports for 32

boxes—gutter, meter or valve 6

brick 4
[see also tile (or tile form)—structural ...4]
acid-resistant
face or front
floor
glazed
modular
refractory or fire
SCR
unglazed

building insulation ..10
[see also roof insulation ....10]
acoustic
  see acoustical materials 11
  plaster:—acoustic or insulating....12
adhesives for
blanket or batt form
block, board or panel
powdered, granulated or shredded
reflective
sprayed-on
sprayed-on—fireproofing
tile
vapor seal or barrier
  see vapor barriers 10

building panels
see panels—building....................3

building papers 8
[see also roofing:—fabric, felt or paper ..8
  insulation:—cellulose fiber (cotton, paper, wood); vapor barriers ....10]

buildings—prefabricated 2
aluminum
movable or expandable
parts for
porcelain enamel
steel

bulletin and display boards 23
changeable letter
cork, magnetic, tackboard, etc.

bumpers
door
  see checks, closers, bumpers and holders—door 18
parking
  see parking equipment:—barriers and bumpers 23

burners 31
[see also boilers; furnaces ....31]
gas, oil or coal

butts
see hardware:—hinges and butts 18

C

cabinets—filing
see filing cabinets 23

cabinets—hospital
see hospital equipment:—cabinets and casework 23

cabinets—kitchen—commercial or institutional
kitchen planning
  see food service equipment—commercial or institutional: — counter and kitchen casework;—planning and contractors 26
metal
  see food service equipment—commercial or institutional: — counter and kitchen casework;—planning and contractors 26

cabinets—kitchen—domestic 25
[see also kitchen or kitchenette units—cabinet, oven, refrigerator, sink, stove ....25]
accessories for
kitchen planning
light-fan combination for
metal
metal-wood combination
wood

cabinets—locker type
see storage:—bins, cabinets or drawers ..23

cabinets—medicine
see bathroom cabinets and mirrors.......27

cabinets—x-ray
see hospital equipment:—x-ray—viewing cabinets, observation booths, floor screens, etc. 23

cabinetwork
see woodwork 5

cables 32
see wire and cables—electric 32
supports for
  see pipe:—hangers and supports 29

caging
see reinforcing:—wire mesh or expanded metal 2

caissons and caisson contractors 1

canopies 19

caps and bases—column or post
see wood frame construction accessories: —caps and bases—column or post ..2
  columns—ornamental metal:—caps and bases for 6

carillons
see church equipment:—bells and carillons 23

carports 19

carriers—sink, urinal, water closet, etc.
see supports—sink, urinal, water closet, etc. 27

carts—clay storage..23
[see also trucks:—hand ....23]

casings—window
see windows—specific types:—casing or trim for 17

castings 6
aluminum
brass or bronze
iron
ornamental
  see ornamental metalwork 6
steel or stainless steel

caulking 7
[see also curtain walls—adhesives, caulking and sealing compounds for.3
  caulking—masonry ....9]
compounds for—glass, plastic, etc.
expansion joint
guns for
joint sealers and fillers (strips, oakum, plastic rope)

caulking—masonry ...9
[see also curtain walls—insulation, adhesives, caulking and sealing compounds for 3
  caulking ....7]
compounds for
guns for

ceiling suspension systems 11
acoustic
acoustic—wall trim for
with fireproofing

products

ceilings
acoustic 11
acoustic—metal, metal pan system 11
luminous 7
  [see also lighting fixtures: — louvered, grid type or luminous ceiling .... 33]
metal—suspended 6
panel system for reinforced concrete 2
plastic—corrugated or flat sheet 7
sprayed-on 10
  [see also building insulation: — sprayed-on; insulation—sprayed-on .... 10]
sprayed-on—fireproofing 10
  [see also building insulation: — sprayed-on—fire-proofing; coatings: — insulating—fire-retardant; insulation:—sprayed-on—fireproofing .... 10]
tile—fiber 12
  [see also ceilings—various types and systems .... 11]
x-ray-protective 22

ceilings—acoustic-light combination 33

cement 4
[see also admixtures—concrete or mortar .. 4
  admixtures .... 9]
acid or alkali-proof
  [see also admixtures:—acid-resistant—concrete .... 9]
anti-bacterial
bond for
canvas or fabric
for insulation
grouting
mastic—for application of flooring, wallboard, etc.
mortar
mortar—premixed
patching and resurfacing
portland
portland—white
refractory
roofing
  see roofing:—cement and coatings for ... 8
tile setting

chairs
see furniture; seating 23

chalkboards 23
accessories for—cleaners, mouldings, troughs, etc.
composition
easel type
glass
plastic
porcelain enamel
portable or movable
reversible
slate
sliding
sliding—vertical balanced

channel stringers
see structural shapes 2

channels—concrete—precast 2

checkroom equipment 23
[see also clothes racks .... 23]

checks, closers, bumpers and holders—door .. 18

chimes
see bells, buzzers, chimes 34

chimneys 31
brick, steel or reinforced concrete
cement and vermiculite
contractors and engineers for
linings for
maintenance and repair
packaged
tops for

chlorine control apparatus
see water conditioning equipment:—chlorinators;—dechlorinators 30

church equipment ... 23
bells and carillons
confessionals
confessionals—grilles for
cushions and draperies
depositories
furnishings—metal or wood
spires
  see spires 8
stained glass

chutes
coal 31
laundry 27
laundry—doors for 27
mail or package
  see mail or package chutes 23
rubbish and waste 28
rubbish and waste—doors for 28

circuit breakers 32

circulators or boosters—heating system 31

clamps
[see also reinforcing:—clamps or clips ... 2]
beam, column, joist, wall, etc. 2
cable and conduit 32
  [see also pipe—clamps or clips .... 29]

classroom equipment
see specific items as:
  carts—clay storage; chalkboards; desks—library, office, school; seating; storage:—bins, cabinets and drawers; wardrobe 23

cleaning equipment .. 28
animal cage
floor
  see flooring:—treatments and maintenance;—treatments and maintenance—machines for; vacuum cleaners 13
    vacuum cleaning systems 28
washers and sterilizers—can

clips
see reinforcing:—clamps or clips 2
  pipe:—clamps or clips 29

clocks 34
  [see also time systems:—synchronous clock .... 34]

closets
accessories for 18
prefabricated 5

clothes hampers—built-in 27

clothes line poles 27

clothes racks 23
[see also closets:—accessories for .... 18]
checking system
coat and hat
overshoe
umbrella

coal—bituminous ... 31

coatings—insulating—fire-retardant 10

coatings and toppings—concrete or masonry .. 9
acid-resistant
bond for
colored
curing
finishing
for concrete forms
hardeners and densifiers
metallic
protection course
sealers
slip-resistant
transparent
water-repellent

cofferdam contractors . 1

coils—air conditioning or heating 31
fin-type
pipe

cold storage insulation
see low temperature insulation 10

collecting systems—dust or fly ash 31

colors—asphalt, cement, mortar, plaster, etc. . . 9

column fireproofing . 12

columns 2

concrete—fiber forms for
concrete—metal forms for
concrete—precast
steel
steel—concrete filled
steel—welded connectors for

columns—ornamental metal 6

[see also ornamental metalwork . . . . .6]
caps and bases for

columns—wood 5

communicating systems

see intercommunicating systems 34

communication chutes 23

compressors 31

compressor-condenser combination
refrigeration

concrete

accessories
  see anchors; bolts; inserts; joints; plugs; reinforcing 2
    masonry construction accessories 4
    water stops—masonry and concrete . .9
admixtures
  see admixtures—concrete or mortar 4
    admixtures 9
bituminous—paving 4
curing—steam 4
post-tensioning 2
repair and restoration 4
tools and equipment for 2

concrete block 4

curing—steam
decorative faced or glazed
filler for pan construction
modular
wall, partition and back-up
x-ray-protective

condensers 31

refrigeration

conduit—electrical . . 32

[see also wiring systems . . . . .32]
fittings and supports for
underfloor ducts

confessionals

see church equipment:—confessionals 23

construction systems . . 2

domed and vaulted roofs
metal framing—nailable
metal framing and fittings for
pan construction—panel ceiling
pan construction—permanent
pan construction—removable
reinforced concrete slab
wood framing

contractors

see specific type contractor as:
  general construction contractors; power plant contractors; structural steel contractors; etc. 35

controls—electric . . . 32

centralized
dimmers
lighting—automatic—daylight
safety switch
  see wiring devices—electrical 32

convectors 31

[see also radiators]
baseboard type
covers and cabinets for

conveyors 24

accessories for
book or record
  see library equipment:—book or record conveyors 23
food
  see food service equipment—commercial or institutional:—conveyors . .26
vertical, horizontal, spiral, etc.

coolers 31

air or gas
liquid

coolers—drinking water 30

[see also fountains—drinking water. . . . . . .30]
bottle type
bubbler type
electric
hot or cold water
ice-cooled
multiple faucet
refrigerator compartment
remote unit

coolers—walk-in

see food service equipment—commercial or institutional:—coolers—walk-in; freezers—commercial or institutional: —sectional; walk-in 26

cooling towers

air conditioning 31
air conditioning—enclosures for 31
water supply 30

copings 8

cast stone, clay, stone or terra cotta
joint covers for
metal
porcelain enamel

copying and printing machines 23

cork or cork composition

see specific application as:
  gasket and packing materials; insulation:—cork 10
  acoustical materials:—tile form—cork or fiber; vibration control:—machinery 11
  floor coverings:—cork or cork composition 13

corner beads

see lath and plaster work accessories:—corner beads and miter 12

counters

commercial or institutional
  see partitions:—office 22
    bank equipment:—counters and check desks .23
    tops—cabinet, counter, sink, etc.: commercial or institutional 26
residential
  see tops—cabinet, counter, sink, etc.: —domestic .25

couplings

see pipe:—fittings—various types 29

cove base

see specific type of floor covering or flooring 13

covers, frames, gratings or traps—catch basin, trench, etc. 6

cranes 24

crematories 23

cubicles

see partitions 22

cupolas

see ventilators:—penthouses for 20

curbs 6

armored concrete
inlets for
stone
  see specific type of stone 4
metal

products

curing and equipment for—concrete
see concrete:—tools and equipment for....2
  concrete:—curing—steam; concrete block:—curing—steam 4
  admixtures:—curing—concrete; coatings and toppings—concrete or masonry:—curing 9

curtain walls 3
aluminum or bronze
asbestos-cement panel
batten-fastening system for
ceramic tile
concrete—precast
  [see also panels—building:—concrete—precast ....3]
glass block
glass spandrels
insulation, adhesives, caulking and sealing compounds for
  [see also caulking 7
  caulking—masonry ....9]
marble spandrels and panels
metal—concrete backup 4
plastic
porcelain enamel
steel or stainless steel

curtains and draperies 19
bamboo or wood slat
hardware for
plastic or fabric
stage
  [see also stage equipment:—curtains and rigging ....23]
stage hardware for

d

damper regulators
see heating controls and control systems..31

dampers—vibration
machinery
  see vibration control:—machinery 11
pressure line
  see vibration control:—pressure line ...30

dampproofing
see admixtures:—water-reducing—concrete or mortar;—water-repellent—concrete or mortar; coatings and toppings—concrete or masonry:—sealers;— transparent;— water-repellent; waterproofing—membrane method 9
  sealers, sealing compounds 15

dehumidifiers 31

depositories
see bank equipment:—night and 24-hour depositories; church equipment:—depositories; library equipment:—depository conveyor 23

desks—library, office, school 23

destructors 28
[see also incinerators ....28]

diffusers—air—ceiling, wall or floor . . 31
accessories for
adjustable
fixed
light combination

dimmers

AETNA STEEL PRODUCTS CORPORATION, 730 FIFTH AVENUE, NEW YORK

AETNAWALL PARTITIONING SYSTEMS

By
AETNA
STEEL PRODUCTS
CORPORATION
Manufacturer-
Contractor

Detailed in this catalog are basic Aetnawall partitioning types. The full scope of Aetnawall function and adaptability is as broad as architects', contractors' or office executives' requirements. Aetnawall stands ready to manufacture and install whatever designs are agreed upon with the competence and speed gained from a background of over 56 years in the hollow metal field. Use this catalog as reference in planning for partitioning and avail yourself of the specialized knowledge of an Aetnawall representative who will be glad to answer your questions and supply quotations.

B

AETNAWALL-A

Extruded aluminum shapes with snap-on pilaster covers. Black reveal accent-strips frame insert panels.

AETNAWALL-T

Flush single-line joint partitioning, three inches thick; all steel, half glass, all glass.

AETNAWALL-PERSPEC®

Slender profiles, easy movability. Wide variety of elevation patterns. Custom versatility.

AETNAWALL-238

The standard most widely used flush-joint post-and-pilaster partitioning system.

AETNAWALL-B

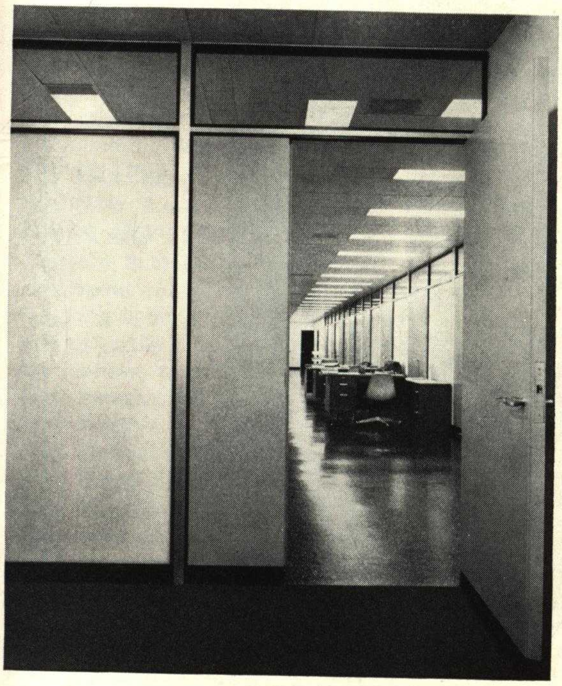
Flush-joint three inches thick. Post and pilaster system. Office, laboratory and industrial use.

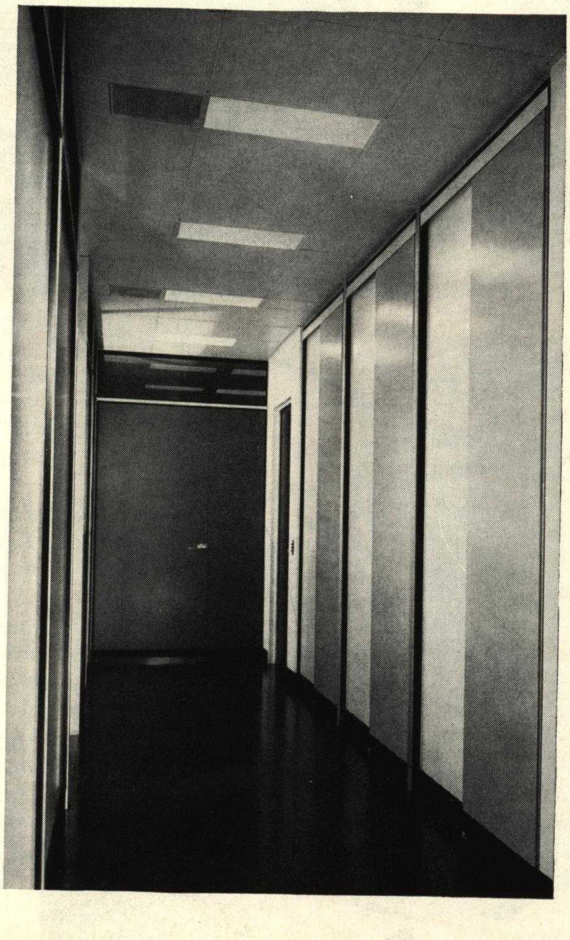
AETNAWALL® INSTALLATION

Aetna Steel Products Corporation provides AETNAWALL installation service throughout the United States and Canada. Aetna field supervisors and their crews are trained specialists in movable partition installation work.

AETNAWALL-A

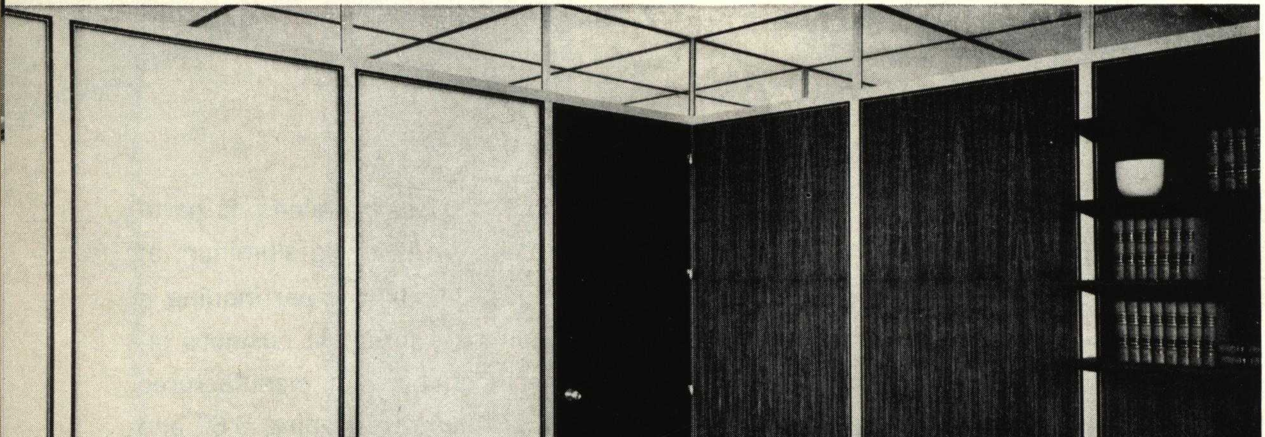
Aetnawall-A, which comes in two design versions, is partition styling brought up to tomorrow. Utilizing aluminum at its structural and decorative best, this type of partitioning is being used by some of the nation's foremost business organizations. Aetnawall-A is a custom partition manufactured to any ceiling height. Ceiling heights exceeding 9′6″ and panel widths greater than 5′0″ are not recommended.

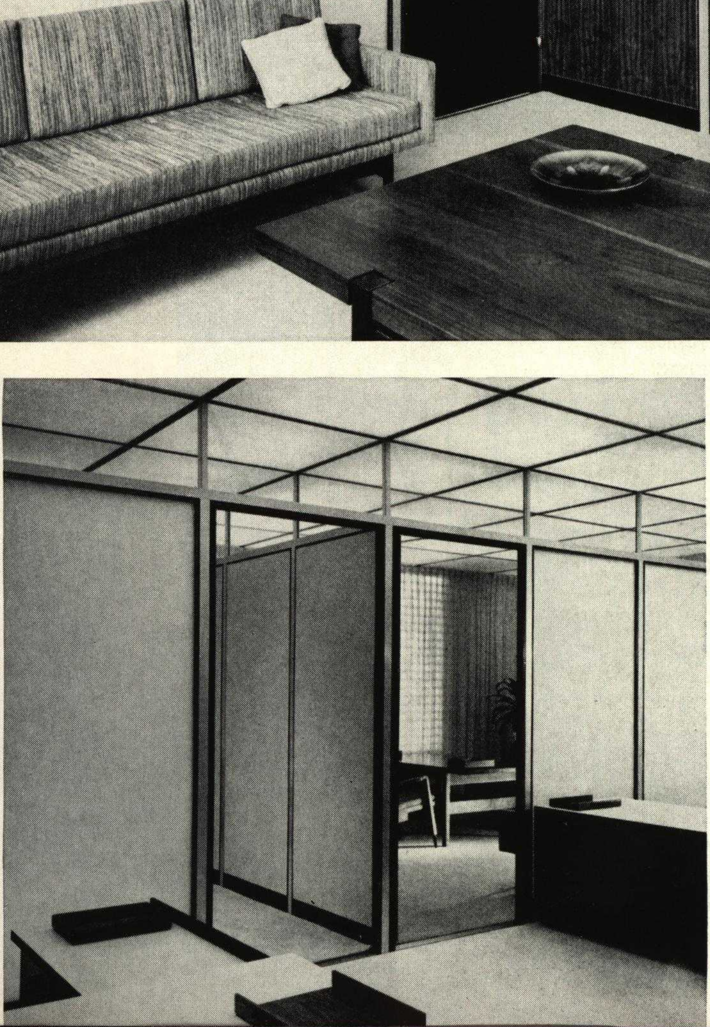




LEFT: POST COVER IS NATURAL FINISHED ANODIZED ALUMINUM, SNAP-ON. GLASS, STEEL OR WOOD PANELS ARE FRAMED WITH ALUMINUM ACCENT STRIP AND BLACK REVEAL. RIGHT: SLIDING-DOOR CLOSET UNITS TO CEILING. BYPASSING SLIDING DOORS. CONTINUOUS FORMED FINGER-GROOVE PULL ELIMINATES NECESSITY FOR APPLIED, PROTRUDING HANDLE HARDWARE. 3/4″ THICK HOLLOW METAL CONSTRUCTION; SUSPENDED FROM OVERHEAD EXTRUDED ALUMINUM TRACK BY NYLON BALL BEARING ROLLERS.

A





THE NATURAL ALUMINUM AND BLACK OF AETNAWALL-A COMBINES WITH A WIDE VARIETY OF COLOR SCHEMES IN INSERT PANELING AND DOORS. ARCHITECTS AND INTERIOR DESIGNERS WILL FIND THE AETNAWALL PAINT COLOR SWATCHBOOK HANDY IN COLOR SELECTION AND STYLING.

SPECIFICATIONS FOR AETNAWALL-A PARTITION

SCOPE OF WORK: Furnish and install complete Aetna Steel Products Corporation's Aetnawall-A type partition as indicated on the plans and specified as follows:

SHOP DRAWINGS: Submit in triplicate drawings showing the complete plan layout with typical details and elevations, special conditions, hardware schedule, extent and type of glass, and extent and type of materials and colors of finish of the panel faces. Shop drawings must be approved by the Architect before proceeding with the work.

GENERAL DESIGN: Units shall be designed so that the partition may be extended in 2, 3 or 4 way directions from any post connection without disturbing any existing material or using fillers or adapters. Any unit shall be readily removable without disturbing the adjacent panels or the filler above, and shall be interchangeable with any Aetnawall-A unit of the same size. Panel unit width shall conform to the building module.

PANEL UNIT: Panels shall be 2" thick, fully packed with rock wool. Panel plates shall be 20 ga. steel with horizontal stiffeners 9" on center welded to back faces of panel plates with a double row of spot welds 3" on center. Panel plates shall be fully pickled cold rolled furniture stock sheet steel, stretcher levelled and free from visible surface defects.

POSTS: The structural vertical posts of the panel units shall be extruded sections of 6063-T5 aluminum, designed to lock to post of adjoining panels by means of positive acting link plates.

POST COVERS: Post covers shall be extruded sections of 6063-T6 aluminum, designed to snap on and off readily without distortion. Post covers shall be fitted neatly against the floor and ceiling.

RAILS: Rails shall be 18 ga. steel rolled shape. Flat trim of extruded sections of 6063-T5 aluminum shall be applied to faces of transom rails.

BASE: Base shall be an 18 ga. steel rolled shape in panel unit lengths to fit neatly between post covers. Base shall be designed to accommodate unevenness in the floor, and shall be readily removable from either side.

TOP FILLERS: Top filler closures shall be of recessed steel construction adjustable to unevenness in ceiling and shall be readily removable.

DOORS AND FRAMES: Doors shall be of 18 ga. steel, hollow metal construction, flush design, 1¾" thick. Faces and vertical edges of doors shall be smooth and shall have no visible grooves nor unfilled joints. Doors requiring lights of glass shall have flush square glazing stops on room side only. Glazing stops shall be removable by small counter-sunk Phillips head screws to assure easy replacement of glass.

Door frames shall be of 18 ga. steel rolled shapes and shall be floating type to allow for shimming and leveling of the partition independently of the frame. Doors and frames shall be provided with proper mortises, cutouts and reinforcements for any specified hardware.

HARDWARE: Unless otherwise specified, hardware shall be Aetnawall manufacturer's standard: one heavy duty cylindrical type latchset interchangeable with locksets of different operations, one pair of 4½ x 4½ ball bearing button tip butts, and one floor stop per door.

FINISH: Aluminum posts shall be anodized with a matte black "as extruded" finish. Post covers and rail trim shall be anodized in natural finish to standard specification No. 204-C1.

All surfaces of steel panels and parts shall be thoroughly degreased, clean and dry before painting. All surfaces of panels and parts shall receive a prime coat of oven-baked enamel. An oven-baked synthetic enamel finish coat of matte black shall be applied to all exposed surfaces except panel plates. Panel plates shall be finished in color as selected.

GLASS AND GLAZING: Glass for partitions and top fillers shall be furnished and installed by the partition contractor. Glass shall be as specified by the Architect. Glass shall be installed in neatly fitted aluminum channels of natural finish.

ERECTION: All metal partitions shall be erected in a workman-like manner, straight and plumb, with all horizontal lines level. Partitions shall be neatly scribed to fit existing building conditions. Hardware shall be properly adjusted and left in perfect working order.

CLEANING: All wrappings and waste shall be removed and the premises left broom clean. Finger marks shall be removed from the partition and construction marks and scratches neatly touched-up. Cleaning glass, washing partition and removing erection dust shall be performed by others.

GUARANTEE: All work shall be guaranteed for a period of one year against defective material and workmanship.

T

AETNAWALL-T

Aetnawall-T is the pioneer single-line-joint partitioning. Sixteen miles of it are used in a single office building in New York. More and more, Aetnawall-T is being specified in place of masonry and plaster. Its advantages include speed of original installation, re-useability of components, time saved in making space-division changes for tenants, lesser thickness (compared with masonry and plaster) resulting in floor-space savings.

AETNAWALL-T IS SHOWN HERE WITH TRANSLUCENT GLASS, FLOOR TO CEILING. IT IS ALSO AVAILABLE IN HALF-GLASS AND ALL-STEEL.

SPECIFICATIONS FOR AETNAWALL-T

SCOPE OF WORK: Furnish and install complete Aetna Steel Products Corporation's 3″ thick flush Aetnawall partition, as indicated on the plans and specified as follows:

SHOP DRAWINGS: Submit in triplicate drawings showing the complete plan layout with typical details and elevations, special conditions, hardware schedule, extent and type of glass and extent and colors of finish. Shop drawings must be approved by the Architect before proceeding with the work.

GENERAL DESIGN: Units shall be designed so that the partition may be extended in 2, 3, or 4 way directions from any post connection without disturbing any existing material or using fillers or adapters. Any unit shall be readily removable without disturbing the adjacent panels and shall be interchangeable with an Aetnawall unit of the same size. The partition shall have flat panel surfaces with only one vertical flush hairline joint defining each post connection.

MATERIALS: Steel shall be full pickled, cold rolled furniture steel, stretcher levelled and free from visible surface defects. All gauges referred to herein are U. S. Standard.

PANEL UNIT: Panel units shall be 3″ thick, fully packed with rock wool, and shall effect a sound transmission loss of no less than 45 decibels. Panel plates shall be 20 ga. steel with horizontal stiffeners 9″ on center welded to back face of panel plates with a double row of spot welds 3″ on centers.

POSTS: The structural vertical posts of the panel unit shall be 18 ga. rolled shape, formed at the bottom to permit wiring behind the base.

GLAZED PARTITION RAILS: Top rails and transom rails shall be 20 ga. rolled shapes. Glazing mouldings shall be removable for easy replacement of glass.

BASE: Base shall be an 18 ga. rolled shape continuous, without plinths. Base on both sides shall be independently adjustable to unevenness in floor and shall be removable from both sides for access to wiring.

Base shall be 4″ high with smooth flat surface, free horizontal lines or grooves and shall have 1/4″ projection.

CORNICE: Cornice shall be 20 ga. rolled steep shape 3″ high, designed as trim to snap on both sides of partition. Cornice pieces shall be adjustable to unevenness in ceiling and shall be readily removable for access to wire space between top of panel and ceiling channel.

END FILLERS: End fillers to columns, walls or partitions other than Aetnawall shall be a pair of 20 ga. sheets, flush with the partition and packed with rock wool. End filler sheets shall be field scribed to job conditions, and fit snugly into a channel securely anchored to the wall.

TOP FILLERS: Double steel for fillers shall extend from cornice to ceiling where required. Top fillers shall be 20 ga. flush steel plates both sides with vertical single line joint uniformly spaced and shall be factory finished. Steel top filler shall be packed with rock wool and shall be readily removable.

DOORS AND FRAMES: Doors shall be of 18 ga. steel, hollow metal construction, flush design, 1 3/4″ thick. Faces and vertical edges of doors shall be smooth and shall have no visible grooves nor unfilled joints. Doors requiring lights of glass shall have flush square glazing stops on room side only. Glazing stops shall be removable by small countersunk Phillips head screws to assure easy replacement of glass.

Door frames shall be of 18 ga. rolled shape having a projection from the face of the partition panel sufficient to permit the base to butt against the jambs without the use of plinths. Door frames shall be floating type to allow for shimming and levelling of the partition independently of the frame. The jambs and head shall be equipped with continuous rubber cushioned stops.

Doors and frames shall be provided with proper mortises, cutouts and reinforcements for any specified hardware.

HARDWARE: Unless otherwise specified, hardware shall be Aetnawall manufacturer's standard: one heavy duty cylindrical type latchset interchangeable with locksets of different operations, one pair of 4 1/2″ x 4 1/2″ ball bearing, button tip butts and one floor stop per door.

PAINT FINISH: All surfaces of panels and parts shall be thoroughly degreased, clean and dry before painting. All surfaces of panels and parts shall receive a prime coat of oven-baked enamel. An oven-baked synthetic enamel finish coat, color as specified, shall be applied to all exposed surfaces. (See AETNAWALL Color Guide for suggested range of colors.)

GLASS AND GLAZING: Glass for partitions shall be furnished and installed by partition contractor. Glass shall be as specified or called for on drawings and be installed in neatly fitted aluminum channels of natural finish.

ERECTION: All metal partitions shall be erected in a workman-like manner, straight and plumb, with all horizontal lines level. Partitions shall be neatly scribed to fit existing building conditions. Hardware shall be properly adjusted and left in perfect working order.

CLEANING: All wrappings and waste shall be removed and the premises left broom clean. Finger marks shall be removed from the partition and construction marks and scratches neatly touched-up. Cleaning glass, washing partition and removing erection dust shall be performed by others.

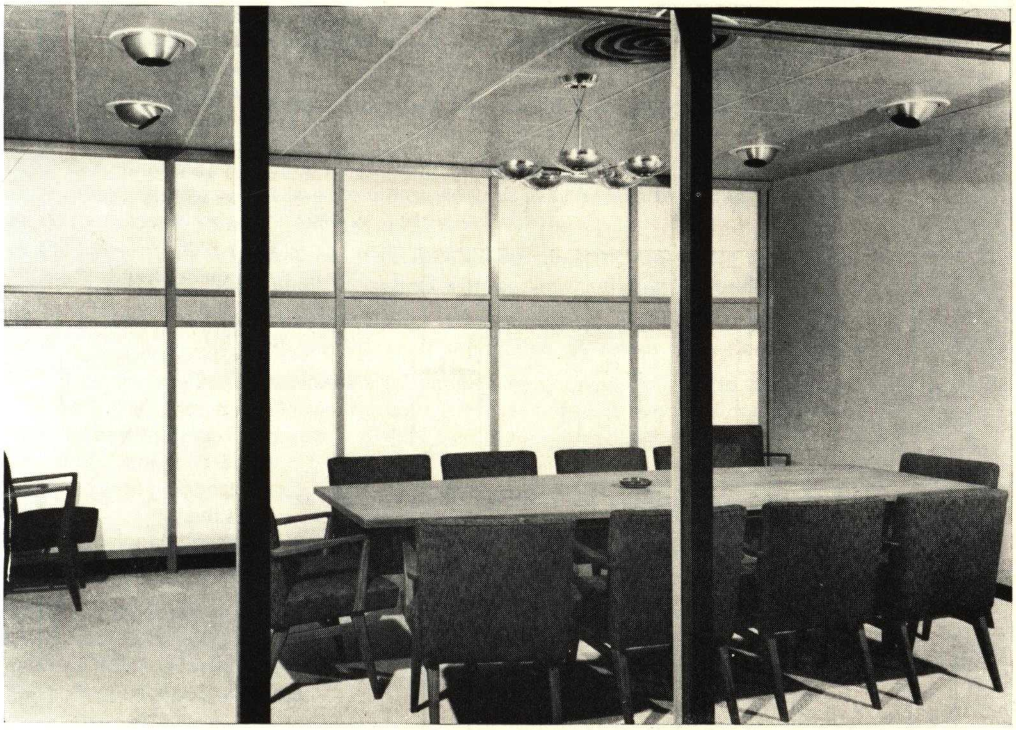
GUARANTEE: All work shall be guaranteed for a period of one year against defective materials and workmanship.

ELECTRIC WIRING DATA: Aetnawall metal partitions have through-ways for electrical wiring in the base, cornice and door frames. Rigid conduit entering Aetnawall partitions from the floor should be located along the centerline of the partition at least 6″ from any post. Conduit connections to flexible cable can be readily made within the base with elbow connectors or handy size junction boxes.

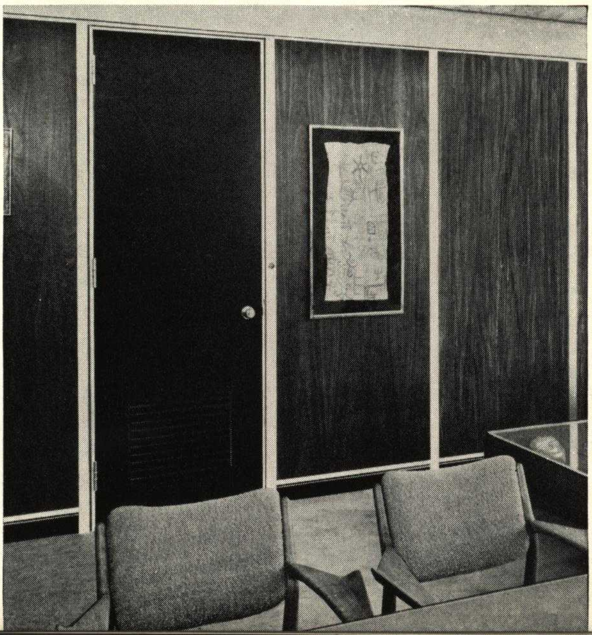
Aetnawall partition is designed to accommodate standard outlet boxes, standard wiring devices and escutcheon plates. No special boxes are required. Switches can be located in the door jambs at any desired height from the floor. Outlets can be located in the base. All electrical wiring devices, boxes, escutcheons, conduit, wiring and connections, etc., are furnished and installed by others.

AETNAWALL-PERSPEC

Perspec is one of the most significant forward steps in partition design that the trade has known for many years. The variety of materials that can be used for insert panels—wood, steel, fabric surfacing, etc.—gives the architect or interior designer working with Perspec an unusual opportunity to achieve custom individuality. Drawings will be prepared by Aetna Steel Products Corporation in cooperation with the architect.

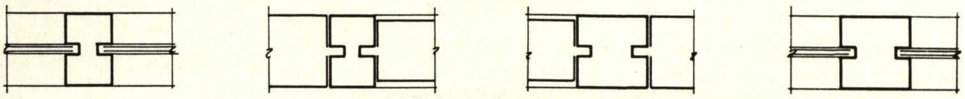


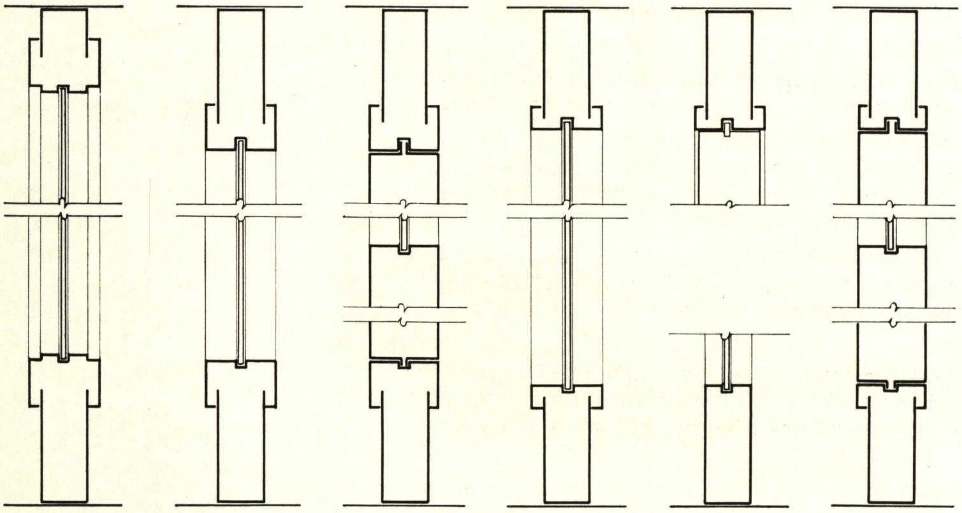
ILLUSTRATIONS ON THESE PAGES SHOW ONLY A FEW OF THE MANY WAYS IN WHICH VERSATILE AETNAWALL-PERSPEC PARTITIONING HAS BEEN USED BY ARCHITECTS AND INTERIOR DESIGNERS. A TWO-INCH WIDE CLEAN VERTICAL POST PROVIDES MODERN SLIM STYLING.

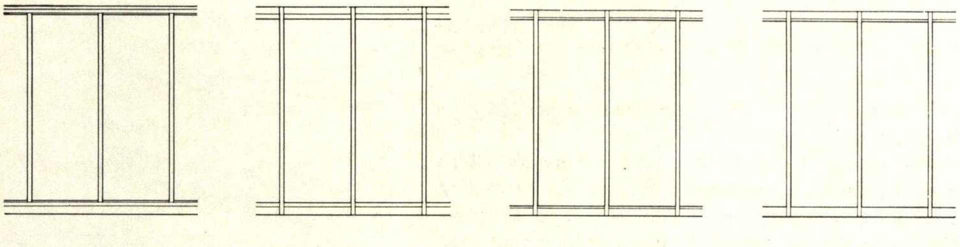


P

DETAILS: ⅛ F.S.







AETNAWALL PERSPEC is a custom partition manufactured to any ceiling height and to any panel width. Ceiling heights greater than 10′0″ and panel widths greater than 5′0″ are not recommended. From a variety of standard parts, the designer can create his own combination of vertical and horizontal lines with flush or recessed panels.

SPECIFICATIONS FOR AETNAWALL-PERSPEC

GENERAL: Furnish and install PERSPEC partitions as indicated on architect's drawings. Partition panels shall be arranged in modular widths as required by the layout. Door units shall be interchangeable with panel units of like widths. End fillers at walls shall be insulated. Construction of panels shall permit two, three or four way connection without disturbing adjacent units.

SHOP DRAWINGS: Shop drawings, in triplicate, shall be furnished for approval before proceeding with work.

MATERIALS: All materials shall be of the best quality. All structural members shall be of steel. All gauges are U.S. Standard and are the minimum acceptable. All steel shall be free from visible surface defects.

POSTS: Posts shall be formed of 16 ga. steel integral with panel and designed to lock to post of adjoining panels by means of a positive acting link plate.

POSTCOVERS: Post covers shall be formed of 18 ga. steel of snap-on type, permitting easy removal for electrical wiring and replacement without damage. The face width shall be 2" or 3" as desired.

PANELS: Panel plates shall be of 20 ga. cold rolled stretcher levelled steel, reinforced with steel stiffeners welded to panel plates on 9" centers by a double row of spot welds on 3" centers. Panels shall be packed with inorganic filler to form a firm backing and insulation. Panel plates shall be 3" apart (flush with post covers), or 2⅜" apart (recessed back of post covers) as desired.

RAILS: Rails shall be of 18 ga. cold rolled steel. Rails shall have a face width of ⅞", 1⅛" or 2" as desired.

BASE: Base shall be formed of 18 ga. cold rolled steel with vertical adjustment to floor and be independently removable on either side for easy access to wiring raceway. Base shall be recessed ½" on both sides of partition.

TOP FILLER: Top fillers shall be of recessed steel construction neatly scribed to ceiling. Where specified, fillers shall be packed with sound insulating material.

END FILLERS: End fillers shall be of 20 ga. steel double construction, insulated, securely anchored to walls, and shall permit adjustment and alteration to various conditions.

DOORS: Doors shall be of hollow metal construction, flush design. No grooves or unfilled joints shall appear on door surfaces. Clearance between door and door frame to be not more than 3/32". Provide proper mortises and reinforcements for all types of hardware application.

HARDWARE: Unless otherwise specified, hardware shall be partition manufacturer's standard: one heavy duty cylindrical latchset interchangeable with locksets of different operations, one pair of 4½" x 4½" ball bearing—button tip butts and one floor stop per door.

FINISH: All surfaces shall be thoroughly degreased and dry before application of finish. All surfaces shall receive a pre-assembly coat of rust-resisting paint baked on. After assembly, finish of color specified shall be applied to all surfaces horizontally and vertically to insure proper coverage.

GLASS AND GLAZING: Glass for partitions shall be furnished and installed by partition contractor. Glass shall be as specified or called for on drawings. Glass shall be installed in neatly fitted aluminum channels of natural finish.

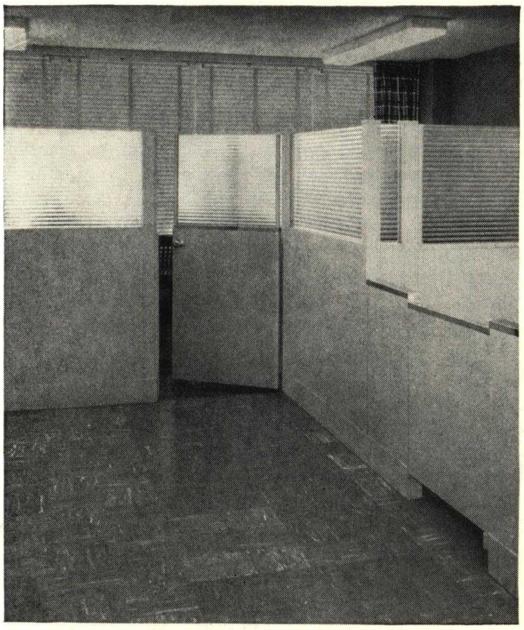
ERECTION: All metal partitions shall be erected in a workman-like manner, straight and plumb, with all horizontal lines level. Partitions shall be neatly scribed to fit existing building conditions. Hardware shall be properly adjusted and left in perfect working order.

CLEANING: Wrappings and waste shall be removed and the premises left broom clean. Finger marks shall be removed from the partition; construction marks and scratches shall be neatly touched up. Cleaning glass, washing partition and removing erection dust shall be performed by others.

GUARANTEE: All work shall be guaranteed for a period of one year against defective materials and workmanship.

ELECTRIC WIRING DATA: Vertical members, top filler and base shall be designed to be readily accessible for installation of electrical wiring.

Wiring may enter partition thru the ceiling by means of BX cable at post centers only. Holes thru partition ceiling channel are cut on job by partition mechanics to admit cable. Wiring may enter partition thru floor by means of rigid conduit with connectors to BX cable located as close to floor as possible within base. Conduit stubs should not be closer than 6" to any post and must be on centerline of partition. Holes thru partition floor channel are cut on job by partition mechanics to accommodate conduit stubs.



CORRIDOR IN FULL-PAGE ILLUSTRATION AT LEFT SHOWS 7′ HIGH STEEL AND GLASS PANELS BOTH WITH AND WITHOUT TOP FILLER. ABOVE: 5′7″ GLAZED RAIL WITH FLUTED GLASS. BELOW: 3′ HIGH RAILING WITH GATE.

AETNAWALL-238

The design and engineering of Aetnawall-238 are the result of long years of experience with movable partitions. All improvements in this Aetnawall category over the years have been made with partitioning's three outstanding requirements in mind—flexibility of performance in dividing space, speed in installation, re-useabililty.

SPECIFICATIONS FOR AETNAWALL-238

SCOPE OF WORK: Furnish and install complete Aetnawall Standard 2⅜" thick flush partition, as indicated on plans and specified as follows:

SHOP DRAWINGS: Submit in triplicate drawings showing the complete plan layout with typical details and elevations, special conditions, hardware schedule, extent and type of glass and extent and color of finish. Shop drawings must be approved by architect before proceeding.

GENERAL DESIGN: Units shall be designed so that the partition may be extended in 2, 3 or 4 way directions from any post connection without disturbing any existing material or using fillers or adapters. Any unit shall be readily removable, without disturbing adjacent panels or filler above, and interchangeable with an Aetnawall unit of the same size. The partition shall have flat panel surfaces with a maximum of four vertical flush hairline joints defining each post connection.

MATERIALS: Steel shall be full pickled, cold rolled furniture steel, stretcher levelled and free from visible surface defects. Gauges referred to herein are U. S. Standard.

PANEL UNIT: Panel units shall be 2⅜" thick, fully packed with rock wool, and effect a sound transmission loss of no less than 45 decibels. Panel plates shall be 20 ga. steel with horizontal stiffeners 9" on center welded to back face of panel plates with a double row of spot welds 3" on centers.

POSTS: The structural vertical posts of the panel unit shall be No. 18 ga. rolled shape, flush with panel plates and designed to lock to post of adjoining panels by means of positive acting link plates. Posts shall be formed at bottom to permit continuous lay-in wiring behind the base.

POST COVERS: Post covers shall be 18 ga. rolled shape designed to snap on and off readily without distortion. Post covers shall be flush with posts and panel plates.

GLAZED PARTITION RAILS: (Omit for Railing and Glazed Railing.) Top rails and transom rails shall be 18 ga. rolled shapes. Removable glazing mouldings shall be applied with small counter sunk Phillips head screws to assure positive positioning and easy replacement of glass.

BASE: Base shall be an 18 ga. rolled shape continuous, without plinths. Base on both sides shall be independently adjustable to unevenness in floor and removable from both sides for access to lay-in wiring. Base shall be 4" high with smooth flat surface, free from horizontal lines or grooves and have ¼" projection. If 6" high base is desired, so specify.

CORNICE: (Omit for Railing and Glazed Railing) Cornice shall be 16 ga. rolled steel shape 2¼" high with smooth flat surfaces free from horizontal lines or grooves, and project no more than ⅜" from face of partition panels. Cornice shall be designed to receive either a double steel top filler or a double ⅜" thick mineral board top filler as specified. A concealed pull-up and alignment device of 12 ga. steel shall be provided for each field splice.

END FILLERS: End fillers to columns, walls or partitions other than Aetnawall, shall be a pair of 20 ga. sheets, flush with partition and packed with rock wool. End filler sheets shall be field scribed to job conditions and fit snugly into a channel securely anchored to wall.

TOP FILLERS: Where double mineral board is specified, top filler shall be ⅜" thick mineral board applied to both sides of studs spaced 24" on center, extending from top of partition cornice to ceiling. Taping joints, spackling, and painting shall be by others. Where double steel is specified, top filler shall be 20 ga. flush steel plates both sides with vertical single-line joint uniformly spaced and factory finished. Steel top filler shall be packed with rock wool and readily removable. Full height floor-to-ceiling panels shall telescope into a continuous fixed ceiling channel securely fastened to suspended ceiling system.

DOORS AND FRAMES: Doors shall be of 18 ga. steel, hollow metal construction, flush design, 1¾" thick. Faces and vertical edges of doors shall be smooth and have no visible grooves nor unfilled joints. Doors requiring lights of glass shall have flush square glazing stops on room side only. Glazing stops shall be removable by small countersunk Phillips head screws to assure easy replacement of glass. Door frames shall be of 18 ga. rolled shape having a projection from face of partition panel sufficient to permit base to butt against the jambs without use of plinths. Door frames shall be floating type to allow for shimming and leveling of the partition independently of the frame. Doors and frames shall be provided with proper mortises, cutouts and reinforcements for any specified hardware.

HARDWARE: Unless otherwise specified, hardware shall be Aetnawall manufacturer's standard: one heavy duty cylindrical type latchset, interchangeable with locksets of different operations, one pair of 4½ x 4½ ball bearing button tip butts and one floor stop per door.

PAINT FINISH: All surfaces of panels and parts shall be thoroughly degreased, clean and dry before painting. All surfaces of panels and parts shall receive a prime coat of oven-baked enamel. An oven-baked synthetic enamel finish coat, color as specified, shall be applied to all exposed surfaces. (See AETNAWALL Color Guide.)

GLASS AND GLAZING: Glass for partitions shall be furnished and installed by partition contractor. Glass shall be as specified or called for on the drawings. Glass shall be bedded in non-hardening putty and back puttied. Putty color shall match color of partition.

ERECTION: Partitions shall be erected in a workman-like manner, straight and plumb, with all horizontal lines level. Partitions shall be neatly scribed to fit existing building conditions. Hardware shall be properly adjusted and left in perfect working order.

CLEANING: All wrappings and waste shall be removed and premises left broom clean. Finger marks shall be removed from partition and construction marks and scratches neatly touched-up. Cleaning glass, washing partition and removing erection dust shall be performed by others.

GUARANTEE: All work shall be guaranteed for a period of one year against defective materials and workmanship.

ELECTRIC WIRING DATA: Aetnawall metal partitions have throughways for electrical wiring in the base, cornice and posts. The minimum wireway clearance will accommodate one ¾" Greenfield flexible conduit or three BX 3-wire cables. Aetnawall partition is designed to accommodate standard 1½" deep, shallow handy boxes, standard wiring devices and escutcheon plates. No special boxes are required. Outlets and switches can be located in vertical posts at any desired height from floor. All electrical wiring devices, boxes, escutcheons, conduit, wiring and connections, etc., are furnished and installed by others.

SPECIFICATIONS FOR RAILINGS AND GLAZED RAILINGS

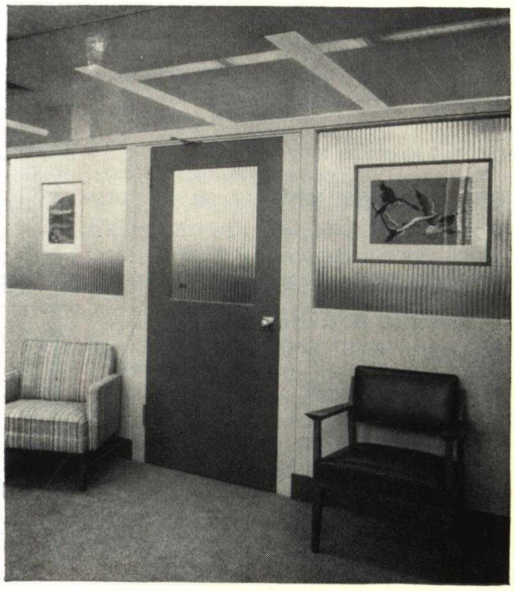
Specifications for Aetnawall-238 partition applies to Aetnawall railing and glazed railing, except that non-pertinent paragraphs such as cornice, top fillers, etc., shall not apply.

SUPPLEMENT TO PARAGRAPH 3: GENERAL DESIGN Railing and glazed railing shall be rigidly secured to floor with completely concealed anchors. No portion of floor anchor shall project the base. Anchor shall provide for concealed fish wiring. Glazed Railing shall be designed so that glazed portion is an integral part of each panel unit. Glazed railing units shall be readily movable without disturbing glass or requiring reglazing.

SUBSTITUTE FOR PARAGRAPH 13: GATES AND JAMBS All gates shall be of 18 ga. steel hollow metal construction, flush design, 1⅜" thick. Gates and jambs shall be provided with proper mortises, cutouts and reinforcements for any specified hardware.

SUBSTITUTE FOR PARAGRAPH 14: HARDWARE Unless otherwise specified, hardware for Glazed Railing gates shall be partition manufacturer's standard cylindrical type lockset and one pair of 3½" x 3½" butts per gate. Unless otherwise specified, hardware shall be partition manufacturer's standard self-centering checking hinge and a continuous stainless steel cap on the top edge of the gate.

GLASS AND GLAZING: Glass for partitions shall be furnished and installed by partition contractor. Glass shall be as specified or called for on drawings. Glass shall be installed in neatly fitted aluminum channels of natural finish. Exposed top edge of glass shall be ground and chamferred.



LEFT-HAND PAGE: FLUSH, ALL-STEEL PARTITION, 7′ HIGH WITH STEEL TOP FILLER; 6″ HIGH BASE. ABOVE: 7′ HIGH, STEEL AND GLASS, GLASS TOP FILLER. LOWER RIGHT: GLAZED RAILING (5′7″); STEEL, 3′7″. CASEWORK BY AETNA STEEL PRODUCTS CORPORATION BUILT INTO STANDARD AETNAWALL RAIL.

AETNAWALL-B

Three-inch thick Aetnawall-B satisfies the requirement, frequently found in specifications, for extra thickness in post-and-pilaster steel partitioning. This partitioning type, which meets federal specifications, is especially in demand for laboratory and industrial applications as well as in offices.

SPECIFICATIONS FOR AETNAWALL-B PARTITION

SCOPE OF WORK: Furnish and install complete the Aetna Steel Products Corporation's Standard 3" thick flush Aetnawall partition, as indicated on the plans and specified as follows:

SHOP DRAWINGS: Submit in triplicate drawings showing complete plan layout with typical details and elevations, special conditions, hardware schedule, extent and type of glass and extent and colors of finish. Shop drawings must be approved by Architect before proceeding with the work.

GENERAL DESIGN: Units shall be designed so that partition may be extended in 2, 3 or 4 way directions from any post connection without disturbing existing material or using fillers or adapters. Any unit shall be readily removable without disturbing adjacent panels or filler above, and shall be interchangeable with an Aetnawall unit of same size. Partition shall have flat panel surfaces with a maximum of two vertical flush hairline joints defining each post connection.

MATERIALS: Steel shall be full pickled, cold rolled furniture steel, stretcher levelled and free from visible surface defects. All gauges referred to herein are U. S. Standard.

PANEL UNIT: Panel units shall be 3" thick, fully packed with rock wool, and shall effect a sound transmission loss of no less than 45 decibels. Panel plates shall be 20 ga. steel with horizontal stiffeners 9" on center welded to back face of panel plates with a double row of spot welds 3" on centers.

POSTS: The structural vertical posts of the panel unit shall be 16 ga. rolled shape, designed to lock to post of adjoining panels by means of positive acting link plates. Posts shall be formed at the bottom to permit continuous lay-in wiring behind the base.

POST COVERS: Post covers shall be 18 ga. rolled shape designed to snap on and off readily without distortion. Post covers shall be flush with panel plates.

GLAZED PARTITION RAILS: Top rails and transom rails shall be 18 ga. rolled shapes. Glazing mouldings shall be removable for easy replacement of glass.

BASE: Base shall be an 18 ga. rolled shape continuous, without plinths. Base on both sides shall be independently adjustable to uneveness in floor and be removable from both sides for access to lay-in wiring. Base shall be 4" high with smooth flat surface, free from horizontal lines or grooves and have 1/4" projection. If 6" high base in unit lengths, with plinths, is desired, so specify.

CORNICE: Cornice shall be 16 ga. rolled steel shape 3" high with smooth flat surfaces free from horizontal lines or grooves, and shall project no more than 3/8" from face of partition panels. Cornice shall be snap-on type designed to be readily removable for access to wire space between top of panel and ceiling channel.

CEILING CHANNEL: Ceiling channel shall be 18 ga. steel, backed up by a neoprene gasket, securely fastened to rigid ceiling in continuous lengths. Post extensions shall be anchored to the ceiling channel and shall be designed to engage the back of the glazing groove of the posts and slide freely in vertical direction to accommodate deflection of ceiling.

END FILLERS: End fillers to columns, walls or partitions other than Aetnawall shall be a pair of 20 ga. sheets, flush with the partition and packed with rockwool. End filler sheets shall be field scribed to job conditions, and fit snugly into a channel securely anchored to wall.

DOORS AND FRAMES: Doors shall be 18 ga. steel, hollow metal construction, flush design, 1 3/4" thick. Faces and vertical edges of doors shall be smooth and shall have no visible grooves or unfilled joints. Doors requiring lights of glass shall have flush square glazing stops on room side only. Glazing stops shall be removable by small countersunk Phillips head screws to assure easy replacement of glass. Door frames shall be 18 ga. rolled shape having a projection from the face of partition panel sufficient to permit base to butt against the jambs without use of plinths. Door frames shall be floating type to allow for shimming and levelling of the partition independently of the frame. The jambs and head shall be equipped with continuous rubber cushioned stops. Doors and frames shall be provided with proper mortises, cutouts and reinforcements for any specified hardware.

HARDWARE: Unless otherwise specified, hardware shall be Aetnawall manufacturer's standard: one heavy duty cylindrical type latchset, interchangeable with locksets of different operations, one pair 4 1/2" x 4 1/2" ball bearing button tip butts and one floor stop per door.

PAINT FINISH: All surfaces of panels and parts shall be thoroughly degreased, clean and dry before painting. All surfaces of panels and parts shall receive a prime coat of oven-baked enamel. An oven-baked synthetic enamel finish coat, color as specified shall be applied to all exposed surfaces. (See Aetnawall Color Guide).

GLASS AND GLAZING: Glass for partitions shall be furnished and installed by partition contractor. Glass shall be as specified or called for on the drawings. Glass shall be bedded in non-hardening putty and back puttied. Putty color shall match color of partition.

ERECTION: All metal partitions shall be erected in a workman-like manner straight and plumb, with all horizontal lines level. Partitions shall be neatly scribed to fit existing building conditions. Hardware shall be properly adjusted and left in perfect working order.

CLEANING: All cuttings and waste shall be removed and the premises left broom clean. Finger marks shall be removed from the partition and construction marks and scratches neatly touched up. Glass and erection dust shall be cleaned by others.

GUARANTEE: All work shall be guaranteed for a period of one year against defective materials and workmanship.

ELECTRICAL WIRING DATA: Aetnawall metal partitions have through-ways for electrical wiring in the base, cornice and posts. The minimum wireway clearance will accommodate one 3/4" Greenfield flexible conduit and three BX 3-wire cables. Aetnawall 3" partition is designed to accommodate standard 1 1/2" shallow handy boxes, standard wiring devices and escutcheon plates. No special boxes are required. Outlets and switches can be located in the vertical posts at any desired height from floor. All electrical wiring devices, boxes, escutcheons, conduit, wiring, connections, etc. are furnished and installed by **others** unless otherwise specified.

FLEXWALL*

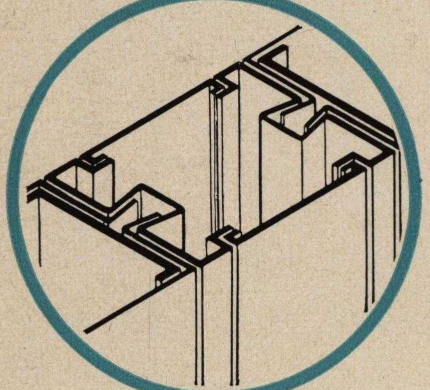
flush "F" partitions

American Sanitary Partition Corporation offers office partitions for modernization of existing buildings and for complete flexibility and economy in office layouts for new construction.

Type F is available either 3" or 2⅜" thick. Post covers and bases are removable for electrical and telephone installation. It is offered in a wide choice of decorator colors, to suit the particular needs of the individual user.

For additional information about the Type F partition presented in this catalog and for assistance in the design and planning of your particular partition problem or for any custom partition service, write or call the American Sanitary Partition Corporation.



1. Available in types to suit the users needs.
2. Available in a wide range of stock heights and widths.
3. Panels are of veneer steel, laminated to a honeycomb core, resulting in a strong and uniformly flat construction.
4. Panels are pre-pierced to provide openings for concealed electrical and telephone wiring.
5. Gates and doors are adjustable to floor variations and are furnished with all necessary hardware.
6. Partitions are available in ten, factory-finished, decorator colors.
7. Installation or alterations can be made by the individual's maintenance crews following our simple installation manual.

general

Scope of Work Furnish and erect complete "Flex-Wall" Flush Type F-2⅜ or F-3 Steel and Glass or All Steel Partitions as manufactured by the American Sanitary Partition Corp., Long Island City, N. Y.

Shop Drawings Detail shop drawings indicating plans, typical elevations, hardware, finish, special conditions and construction shall be submitted to the architect in triplicate for approval before proceeding with the work.

Unit Sizes Panels shall be from 24" to 60" wide in multiples of 6"; cornice height shall be 7'-2", 8'-4" or 9'-2".

Materials All exposed steel shall be cold rolled furniture steel. Gauges specified are U. S. Standard.

Construction Face plates of Panels shall be laminated to a honeycomb core to form a solid uniformly strong panel. This Panel unit and horizontal rails shall be constructed so that extensions of different height units can be made in any straight or rectangular direction. Door units are interchangeable with panel units of similar size.

Finish All surfaces shall be chemically cleaned and finished with one coat of rust inhibitive primer and one finish coat of solid color, marproof, baked on enamel.

Installation Partitions shall be erected to be rigid, straight and plumb, securely anchored to floor and cornice. Ceiling braces shall be provided on runs of over 20 lineal feet, unsupported by crossruns. Top fillers shall be neatly scribed to any wall or ceiling variations and all cutouts or joints shall be reenforced properly.

Glass and Glazing Glass as specified shall be furnished as required. Removable glass mouldings, replaceable without use of screws shall be used for glazing panels and doors. Glass shall be embedded in metal sash putty colored to match partitions.

materials and construction

Bases Bases shall be 18 gauge steel, 6" high and adjustable to the floor variations and shall have provisions for electric wiring. Adjustable plinth shall be provided for the post section.

Panels Panels shall be of 20 gauge steel and completely flush with post and pilasters, reenforced with a 16 gauge channel laminated to a honeycomb filler of respective thickness to produce a solid, uniformly strong panel unit. This filler shall be made of 33 pound board, ¾" cells, and have a compression strength of 55 lbs. p.s.i.

Rails Rails and glass mouldings shall be of 20 gauge steel and of sloped design to prevent the accumulation of dirt and dust.

Posts Posts shall be of 18 gauge steel and designed to permit future changes; two, three or four way connections without disturbing the adjacent units. Post covers shall be of 18 gauge steel—snap on type.

end filler

End Filler shall be of Flush construction; set into wall channel and locked into position at post. Both wall filler plates and wall channel shall be of 20 gauge steel.

cornice and top filler

Cornice Cornice shall be of 16 gauge steel furnished in 12 foot lengths and corners. Reenforced joints insure true alignment and rigidity.

Top Filler Top filler where required shall be of ¼" double mineral board construction. Double steel top filler if specified shall be 20 gauge steel, single line joints uniformly spaced.

doors

Door Frames Door frames shall be of 16 gauge steel adjustable to floor variations, and interchangeable with panel units of similar size.

Doors Doors shall be Flush 1¾" thick with 18 gauge stiles and 20 gauge steel panels laminated to a honeycomb core. Each door shall be properly mortised and reenforced for all hardware.

Hardware Standard hardware shall consist of one pair of 4½" x 4½" ball bearing template butts painted and a Schlage A-51-WD Lockset in a U. S. #10 Finish.

Transoms Fixed transoms are standard on all partitions over 7'-2" high. Movable transoms are center pivoted friction type with transom catch. All transoms are constructed of 18 gauge steel moulding designed to match general construction.

railings

3'-6" (no glazing)

Furnish and erect complete Flex-Wall Type Railing, 3'-6" high, Type F-2⅜ or F-3 as manufactured by American Sanitary Partition Corp., Long Island City, N. Y.

Panel, Post and End Filler construction and design shall be as specified for and to include the following features:

handrail

Handrail shall be of 18 gauge steel designed to harmonize with the adjacent members.

floor shoe

Floor shoes shall be concealed except on gate posts where additional floor support is required.

gate

Gates shall be of 1" thick flush construction set 6" off floor 34" high and 2" from top of panels.

hardware

Hardware shall consist of a pivot type spring hinge, adjustable, single or double acting and a secret gate latch.

5'-6" glazed

Furnish and erect complete Flex-Wall Glazed Railing 5'-6" high, Type F2⅜ or F-3 as manufactured by American Sanitary Partition Corp., Long Island City. N. Y.

Panel, Post and End Filler Construction and Design shall be as specified for each respective type and to include the following features:

Solid panel height shall be 42", glass height 24", all posts shall be finished with a 16 gauge steel cap.

floor shoes

Floor shoes shall be concealed except on the gate post where additional floor support is required.

gates

Gates shall be 1¾" thick set 6" off floor; all railing gates shall swing in.

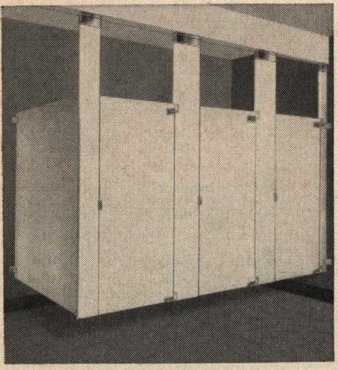
hardware

Hardware for glazed railing gates shall consist of Hydraulic Hinges, adjustable single acting and a Schlage Lockset No. A-51-WD.

glass

Minimum glass thickness for this type shall be 7/32" thick and the exposed top edge shall be ground smooth.

toilet partitions

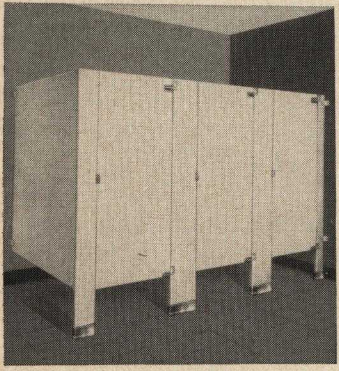


type "CS", ceiling stile

The latest type of toilet partitions to be developed is the suspended Ceiling Stile model. This outstanding development creates an absolutely unobstructed floor area, simplifying cleaning and lowering the continuous cost of maintenance.

Stiles are suspended from the ceiling and are fastened to structural members provided by others. Rigid installation is assured because panels and stiles are connected with three concealed tension cleats.

Stiles, panels and doors are all of flush design, finished with high quality baked-on enamel in a selection of modern colors.

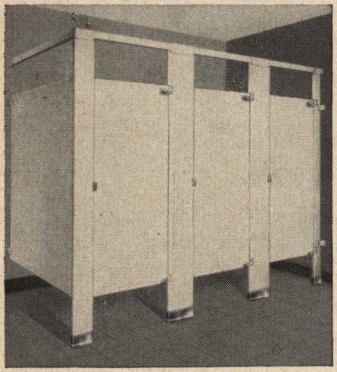


type "FS", floor stile

This type of partition is a reflection of modern building design. The elimination of headrails adds to its modern appearance. Posts have been replaced by flush stiles which eliminate dirt catching corners and minimize maintenance operations.

Stiles are extremely rigid. They are fastened to the sub-floor, provided by others, and are connected to panels with three concealed tension cleats.

Stiles, panels and doors are all of flush design, finished with high quality baked-on enamel in a selection of modern colors.



type "FF", full flush

The Full Flush model is the most popular type of toilet partition available today. It reflects the modern appearance of more expensive types, yet does not require special structural provisions to effect a rigid installation. Flush stiles minimize maintenance operations, just as on all expensive types.

The headrail bracing makes this model self-supporting, permitting installation in any desirable position. Stiles are fastened to the finished floor and are connected to panels with three concealed tension cleats.

This type is frequently used in conjunction with types "CS" and "FS" where headrail bracing is needed. Stiles, panels and doors are all flush, finished with baked-on enamel.

type "PL", plastic laminate

Toilet partitions surfaced with high pressure decorative laminated plastic are the latest development of modern materials and design for sanitary and attractive restrooms.

Our use of laminated plastic with its proven superiority to other more commonly used materials together with our many years of experience in the toilet partition industry has produced a toilet partition unit that offers more advantages and beauty than any other materials used to date.

Our design is developed from our metal partition line, incorporating all of the features required to produce a sound, rigid and lasting installation. To these important basic principles, we have added the permanence, beauty and warmth of laminated plastic thus making possible an economical unit which requires little or no maintenance.

These partitions are available in a wide variety of warm, glowing colors and patterns and will delight the architect and decorator with their beauty.

Custom Line

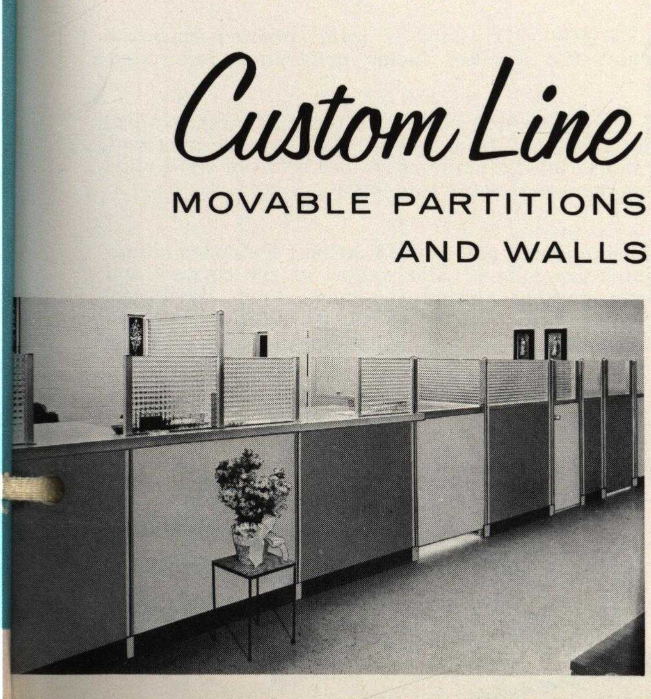
MOVABLE PARTITIONS AND WALLS

Architectural Systems' Custom Line is a complete and highly versatile system of movable partitions and walls that create beautiful and distinctive modern interiors at costs approximating those of conventional partitions. The system offers architects and building owners these unique advantages:

COMPLETE FREEDOM OF DESIGN—The extruded aluminum components of the Custom Line system have been developed by ASI to allow unlimited variations in floor layout and interior styling. Panel runs can start at any post. Partitions of varying heights can be simply and easily combined. The wide range of panel facings, finishes and core constructions available will fit virtually any requirement for appearance, durability, noise reduction and fire resistance.

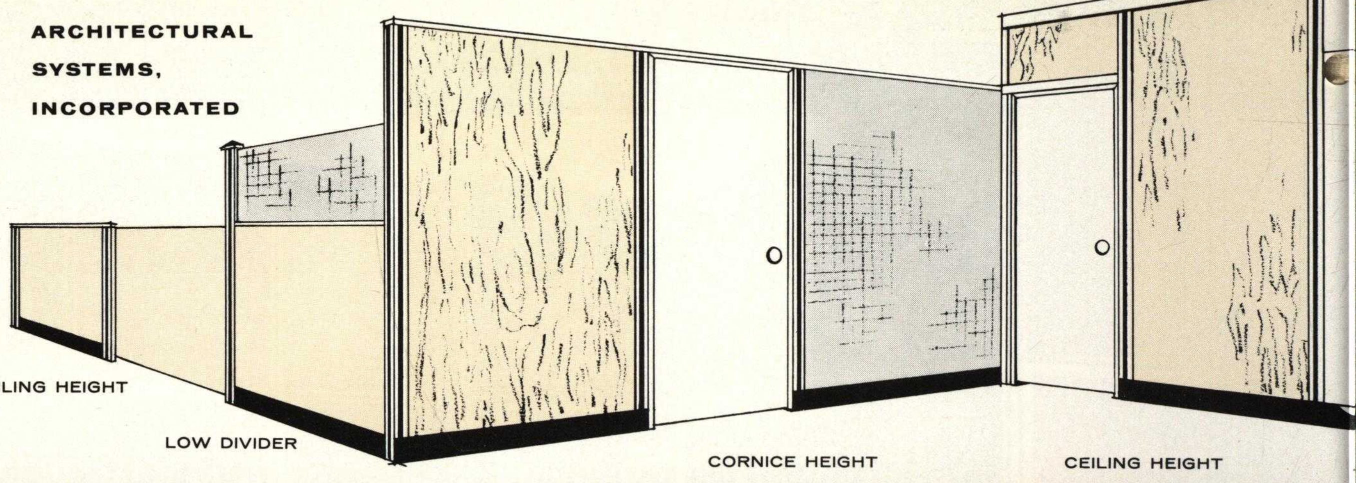
INTERCHANGEABILITY—Solid panels, glass panels and door units can be interchanged without moving adjacent panels and with 100% salvageability.

EASE OF INSTALLATION—The Custom Line's basic post design makes wall erection fast and economical. ASI's panel adjustment feature compensates for uneven floors and allows the partition runs to be squared up and levelled quickly and accurately.



At left, a typical Custom Line low divider partition with built-in counter. Panels are finished in a combination of modern pastel colors. Above, in color, a typical office interior with Custom Line ceiling height walls. Note the clean lines and conservative modern beauty achieved.

ARCHITECTURAL SYSTEMS, INCORPORATED



Custom Line CONSTRUCTION DETAILS

DIMENSIONS

Custom Line partitions and walls can vary from 42″ vertically to any ceiling height. Panel widths available from 12″ to 60″ in any 12″ increment. Special filler panels available for odd dimensions. All panels, regardless of facing or core materials, are 1¾″ thick.

ASI PANEL FACINGS

WOOD: Panels are faced with "A" grade hardwood veneers in a wide variety of wood types and grains. Any of three standard core constructions (see below) can be employed. Veneer facings are permanently laminated to the frame and core under pressure. Surfaces are thoroughly sanded, toned and sealed, nub sanded and filled where needed. The final synthetic dull gloss finish is scratch and mar resistant.

HARDBOARD AND PLASTIC LAMINATES: Hardboard facing ⅛″ thick is finished in a special semi-gloss paint, selected for its durability and ease of maintenance. ASI standard colors, recommended by leading color consultants, include Sandtone, Graylight and Softgreen. Special colors available on order. Plastic laminates also available in a wide range of colors, finishes and simulated wood grains.

STEEL: 22-gauge steel is laminated to the ASI honeycomb core and the panel encased in a 16-gauge "U" channel steel framing on all four edges. Surfaces are cleaned, primed, sanded and finished with synthetic enamel in any specified color. ASI recommends one of three standard colors — Sandtone, Graylight or Softgreen.

GYPSUM BOARD: Gypsum board facing ⅜″ thick is laminated to gypsum core spacers (see below) and finished with one coat of primer. ASI recommends that final finish be applied by others after installation of the panels.

ASBESTOS: Asbestos-cement board ⅛″ thick is laminated to any one of the standard ASI cores described below. Available factory finished in ASI standard synthetic colors — Sandtone, Graylight or Softgreen — or as specified.

VINYL-METAL LAMINATES: Available in a variety of textures and simulated wood grains. Vinyl offers a permanent facing material, highly resistant to abrasion, soil and chemical corrosion.

PRESSED CHIPWOOD: 1¾″ thick pressed chipwood board is used in solid panels. Synthetic finishes used the same as for HARDBOARD above.

ASI CORE CONSTRUCTIONS

HONEYCOMB: Panel frames of kiln dried wood have 1½″ stiles, 2½″ rails. Core material is Kraft honeycomb 1″ cells between expanded sheets. Specified facing is laminated to the core and frame.

GYPSUM: Fire resistant core is formed of two ⅜″ gypsum sheets between which gypsum spacers 3″ wide on 12″ centers are laminated. Selected facing is laminated to the outer core surfaces.

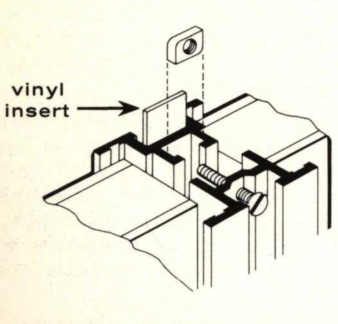
PRESSED CHIPWOOD: Core is solid, pressed chipwood board, to which the specified facing material is laminated.

GLASS PANELS

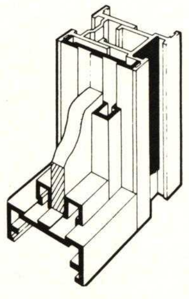
Any one of the many makes and patterns of architectural glass, in any thickness from ⅛″ to ²¹⁄₆₄″, can be specified. Glass is set in extruded aluminum frames between rigid vinyl stops without the use of screws or putty.

DOORS

Doors available to match panel specifications. Extruded aluminum door jams are mitered and welded at the corners and have synthetic gaskets around the door stops. Hardware, either supplied by ASI or otherwise furnished to specification, is factory installed.



STANDARD POST ASSEMBLY



GLASS PANEL ASSEMBLY

Custom Line ACCESSORIES

ASI will manufacture to order any one of several accessories such as the table-desk, wall cabinet and shelves illustrated. They are simply and securely attached to the Custom Line post assemblies without marring the panels in any way.

MOVABLE PARTITIONS AND WALLS
specifications

SCOPE OF WORK — Furnish and install complete the "CUSTOM LINE" Movable Partition as manufactured by Architectural Systems, Inc., of Grand Rapids, Michigan.

SHOP DRAWINGS — Submit in accordance with requirements of standard and special conditions all shop drawings in triplicate, detailing panel type and sizes, floor layout, typical elevations, finish and other pertinent information for final approval before commencing fabrication.

PARTITION FRAMEWORK

Aluminum — All posts, glass channel, door jambs, ceiling cap, stiffener section and related accessories to be of 6063-T5 Alloy, Bright Mill Finish Extruded Aluminum. Anodizing treatment available to architect's specifications.

Posts — Standard posts (Patent Pending) shall consist of two extruded sections assembled with machine screw and eliptical nut drawn tightly over panel edge or glass channel. Vinyl insert to be provided to conceal bolt face and opposite face forming decorative strip. Recess post face to permit self hanging desk, cabinets and shelves with Standard ASI bolt and nut. Post to permit complete interchangeability of panel and door units without removing adjacent units. Each post shall provide for panel runs in 2, 3 or 4 directions.

Door Jamb — ASI aluminum extruded door jamb shall be mitered at top corners and welded from the inside so as to provide a structurally sound jamb and give a clean exterior appearance. Hinges shall be face mounted or milled into jamb to present flush appearance, as specified. Jamb shall accommodate 1¾″ thick door. Stops shall have a continuous vinyl bumper.

Glass Channel and Stops — Aluminum extruded glass channel and extruded vinyl glass stops shall be provided to accommodate glass in varying thicknesses from ⅛″ to 21/64″ without the use of screws or putty.

Ceiling Channel — Shall be extruded aluminum and shall allow for adjustment to compensate for uneven ceilings.

Module — Shall consist of modular units consistent with the building module. Panels available in 6″ increments. Panels 48″ center line to center line of post recommended, however most solid panel types available up to 60″ with some to 72″. Heights as specified.

PANEL TYPES

Wood Panels — Panels shall be 1¾″ thick. Core shall be of solid Pressed Chipwood, Kraft 1″ Cell Honeycomb between expanded sheets or a fire resistant Gypsum Core formed of two ⅜″ Gypsum sheets between which Gypsum spacers 3″ wide on 12″ centers are laminated. Face Veneers shall be "A" grade specially selected for architectural adaptation with respect to cutting lengths, uniformity in color, figure and grain character, and shall be Book Matched. High quality "B" grade veneers, random selected with intentional mismatched, dimensioned faces at less cost. Specie of wood to be selected and sample submitted.

Hardboard — Hardboard facing ⅛″ thick to be laminated to one of the cores specified above.

Asbestos — Asbestos cement board ⅛″ thick to be laminated to one of the Standard ASI Cores.

Pressed Chipwood — Panel shall be 1¾″ thick solid Pressed Chipwood Board.

Wood Finishes — All surfaces are to be thoroughly sanded, toned, sealed, nub sanded and filled where needed. The final finish is a synthetic dull gloss finish and is scratch and mar resistant. ASI standard colors include Sandtone, Greylight and Softgreen. Special colors available on order.

Plastic Laminates and/or Vinyl-Metal Laminates — Facing to be laminated to solid Pressed Chipwood Core. Available in a variety of textures and simulated wood grains.

Steel Panels — Panel to be made of 22-gauge steel facing laminated to the ASI Honeycomb Core and encased in a 16 gauge "U" channel steel framing on all four edges. Also available with face of 26 gauge steel laminated to ASI Pressed Chipwood Core.

Steel Finishes — Surfaces are to be thoroughly cleaned, primed, sanded and finished with synthetic enamel in specified colors.

Glazed Panels and Glazing — Glass for Movable Partitions shall be furnished and installed by partition manufacturer of design, quality and thicknesses as specified. Glass shall be set in Standard ASI rigid vinyl glass stops without the use of putty or screws and shall accommodate glass thicknesses from ⅛″ to 21/64″ or single panel materials of similar thicknesses.

Doors — Doors shall be 1¾″ thick in widths as specified in wood or steel. All doors shall be properly worked for hinges, locks or passage sets and door check. Doors available with louvered or glazed opening as specified. Door units with glazed sidelight or side panel to conform to selected module.

HARDWARE — Hardware to be as specified under hardware heading, to be furnished by partition contractor or hardware supplier. Hardware to be installed by partition contractor. If supplied by other than partition contractor butts and lock set templets to be forwarded to partition contractor for installation and cut out. Wood Doors to have 1½ pairs of 4 by 4 butts.

ELECTRICAL — Provision for lay-in wiring shall be made in wiring raceway at the base, door jambs, cornice and ceiling channel. Provision shall be made for conduit raceways, switch and plug outlets in panels where required.

ERECTION — Partitions shall be erected in a rigid manner, straight and plumb, with all horizontal lines level. They shall be mounted over finished flooring. All joints shall be perfectly membered and tight fitting. All hardware shall be in proper working order.

CLEANING — Thoroughly clean panels and posts. Replace any damaged or defective work. All rubbish and cartons shall be removed and the job left broom clean. Cleaning of glass and washing are to be done by others.

CAPITOL BATTENS for KEYLINE PARTITIONS

1. **AVAILABILITY**—adequate stocks permit prompt shipment—conveniently packaged for job storage or field distribution.
2. **ERECTION**—made easy by having the proper temper for spring fitting of parts and panels.
3. **APPEARANCE**—all visible parts have an anodized finish.
4. **FLEXIBILITY**—of erection is unexcelled since battens and panels can be field sawed.
5. **FEATURES**—
   (A) movability or permanence.
   (B) completely enclosed raceways wherever needed.
   (C) two piece ceiling combination allows for ease of erection and for differences in floor to ceiling height.
   (D) 1 9/16", 1 1/8" or 11/16" panels may be used.

CAPITOL BATTENS for CURTAIN WALLS

—Designed for use with panels of 1 1/8", 1 9/16" or 2" thickness.

EXTRUDED ALUMINUM BATTENS—Corner Combinations —Angles—H-Sections—Rosettes—All extruded parts plain mill finish.

FASTENERS—4 designs using galvanized metals.

Z-Angles and Flashings—using sheet aluminum.

CAPITOL BATTENS • keyline partitions • curtain walls

short form specifications

keyline partitions

Battens, Base, Butt Moldings, Door Jambs, Corner Combinations and Glass Stop shall be as produced by Capitol Battens, 1408 Fuller St., Lansing, Michigan. Extruded from 63ST5 Aluminum Alloy with anodized finish and used with either 1⁹⁄₁₆″, 1⅛″ or ¹¹⁄₁₆″ panels as specified by the architect.

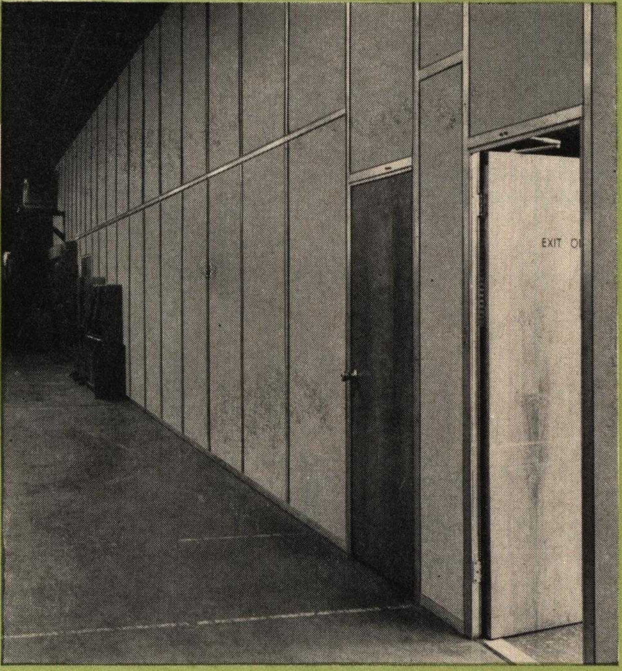
Alternate or screw type partitioning plain mill finish—and for 1⁹⁄₁₆″ panels only.

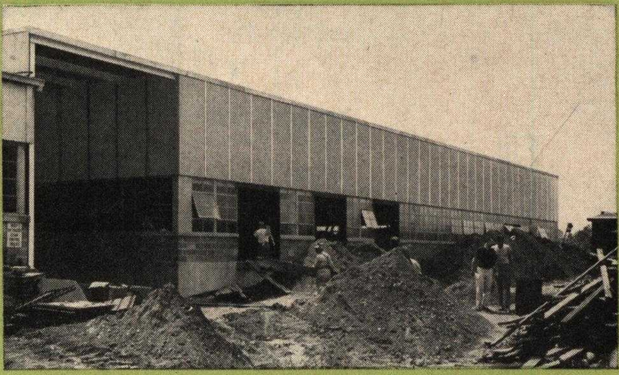
(Doors, door hardware, glass and anchoring devices to be furnished by others.)

curtain walls

PANELS—Curtain Wall Panels shall be (1⅛″), (1⁹⁄₁₆″), (2″) in thickness, 4-ft. or less in width, and (specify) in length.

ACCESSORIES—Panels shall be (vertically) (horizontally) applied to framing and fastened to flanges of girts with appropriate clips, fasteners, bolts and washers. Vertical and horizontal joints shall be covered with extruded aluminum battens with plain mill finish and extruded neoprene gasket—all as produced by Capitol Battens.





Erection drawings showing proper installation for either Partitions or Curtain Walls will be furnished on request. Field service to show proper methods of layout and installation is available.

FIBERGLASS OFFICE PARTITIONS

MODULAR • MOVABLE • FREE-STANDING

CORRY
JAMESTOWN CORPORATION
CORRY, PENNSYLVANIA

STEEL AGE OFFICE PARTITIONS

- **A complete range of panels in carefully selected colors, heights and widths.**
- **Completely prefabricated panels and posts ready for installation. No plastering, painting or carpentry work.**
- **No change in heating, lighting or air conditioning systems.**
- **Quickly installed by regular maintenance personnel without disrupting office routine.**
- **All connections completely hidden from sight, and no unsightly plug buttons.**
- **Changes in arrangement can be made at any time without reconditioning expenses.**
- **All parts 100 per cent reusable.**
- **A lifetime of handsome, like-new appearance with little or no maintenance.**

a new dimension in space

With today's emphasis on attractive and efficient offices, free-standing, movable partitions provide a welcome answer to the growing cost of office space. With this type of space division, a greater concentration of personnel can be comfortably and efficiently accommodated without the need of additional floor space. And more economically, too, contrasted with the construction of permanent, bulky walls.

But now a new dimension has been added . . . *complete flexibility!* Corry-Jamestown Corp., long recognized as a leading manufacturer of quality office furniture, has developed the revolutionary Steel Age *Fiberglass* Office Partition. Colorful, durable and completely flexible, this unique partition line combines the first truly universal post-and-panel design with the finest in modern materials.

Thanks to the flexibility of new *Steel Age* Partitions, you can divide office space to meet virtually any work plan, create economical areas of individual and group privacy, and provide a natural baffle against office noise and confusion. Then, at any time, you can easily and economically change the arrangement to keep pace with new demands.

Steel Age Fiberglass Partitions are available from office equipment dealers throughout the country. And for investment purposes, these partitions are considered office furniture rather than an addition to your building.

Only Steel Age Fiberglass Partitions offer all these features . . .

CORRY
JAMESTOWN CORPORATION
CORRY, PENNSYLVANIA

Exclusive COLOR BEAUTY IN PARTITIONS

Interesting and subtle textures of fiberglass, the natural beauty of satin finished aluminum and discriminate color selection make these the most attractive partitions available. Panel colors were especially chosen by decorators to harmonize with modern trends in office decor, and with the combined colors offered in the complete line of Corry Jamestown office furniture.

These select colors, molded through the entire cross-section of the fiberglass sheet, are permanent and stainproof. And from this depth comes a beauty and lustre impossible to obtain with ordinary painted surfaces. Contrasting or complementary colors can be chosen for each side of the partition or door panel so that varying color schemes can be used by adjacent departments sharing a common panel wall.

Color selection and modular flexibility of these finely crafted panels permit easy blending into any setting for beauty combined with efficiency.

Beauty that lasts . . . indefinitely

When you specify these exclusive Corry Jamestown fiberglass partitions, you assure a lifetime of worry-free, care-free service. For the rugged construction of framing materials is matched by the lasting qualities of the fiberglass itself.

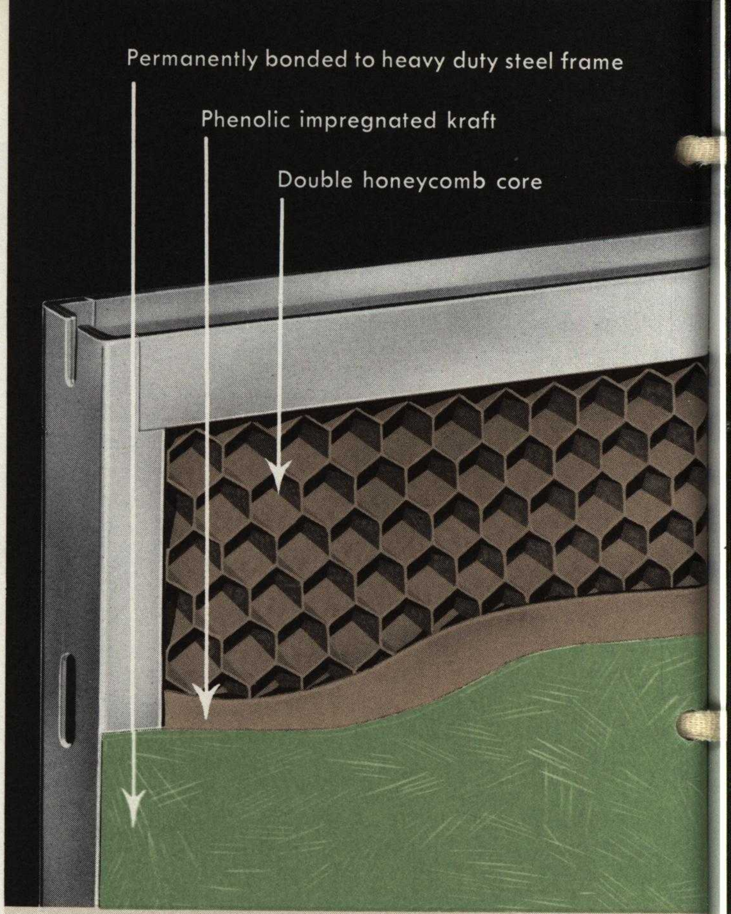
Exclusive

FIBERGLASS PANEL

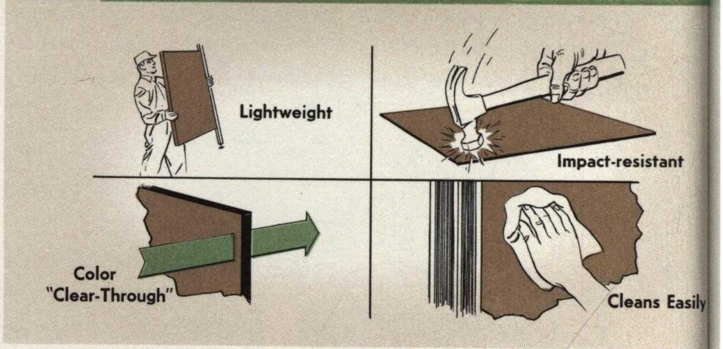
This new and completely unique *Steel Age* Partition panel is a homogeneous construction consisting of a specially-designed double honeycomb core, phenolic impregnated kraft and two fiberglass sheets, permanently bonded to a 16-gauge steel channel frame. The result is a 1¾″ panel, exceptionally strong, lightweight and capable of absorbing severe impact punishment. Surfaces are plumb and will not buckle or warp, regardless of the length of "run" or installation.

Steel Age Partition panels can be cut at any point without diminishing the structural strength, because of this revolutionary construction. And in special cases where it is required, panels can be custom cut with a hacksaw and common handsaw at the installation site for perfect fit.

Because the fiberglass has color "clear-through", the assembled panel is essentially scratch-proof and marproof. *There is no paint to chip or peel*, and the panel can be used and re-used continually without wear or damage. Soil of any type, including indelible and duplicator inks, paints and varnishes can be easily wiped off. And of course, soap and water, commercial cleaning compounds, solvents and stain removers will never damage the natural finish of the fiberglass or the aluminum posts and trim (all anodized).



Permanently bonded to heavy duty steel frame
Phenolic impregnated kraft
Double honeycomb core

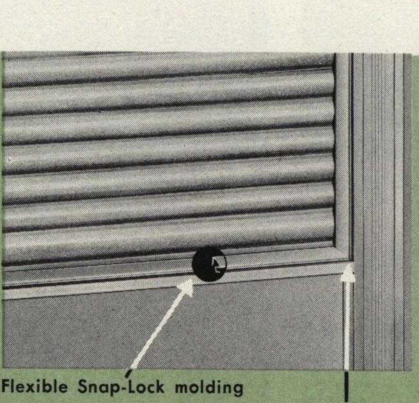


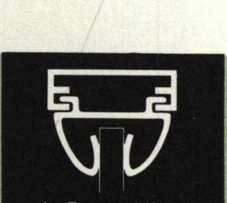
Exclusive

SNAP-LOCK GLAZING FOR PANEL INSERTS

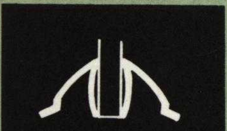
Glass in a variety of patterns, and other upper panel materials, are quickly and easily installed into *Steel Age* Fiberglass Partitions. No tools or special skills are required. The exclusive Snap-Lock* molding snaps firmly and positively into place with only finger-tip pressure, forming perfectly mitered corners and providing firm support for the insert.

Strong, satin-finished aluminum trim channels are attached to the fiberglass panel by hidden connections, framing the panel opening on three sides. The unique, flexible Snap-Lock molding strips are then positively locked into recesses in these channels. A specially-designed top molding strip locks on the top edge of the insert and fastens to the vertical posts for a neatly finished assembly. The upper panel cannot rattle, or be accidentally displaced. And *Steel Age* Partition design leaves no exposed glass edges to become damaged or cause injury.





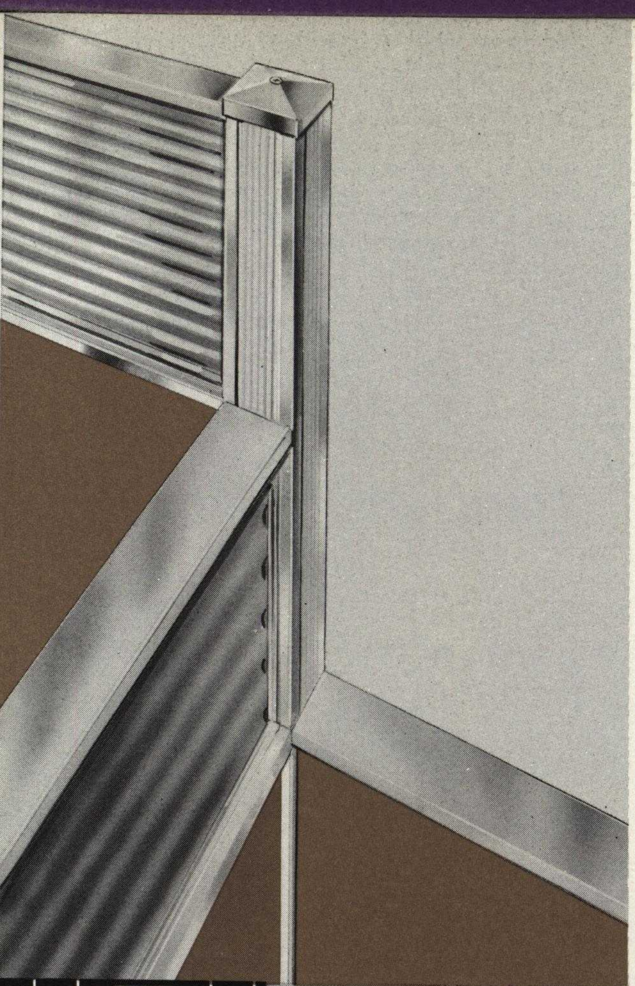
A. Top molding

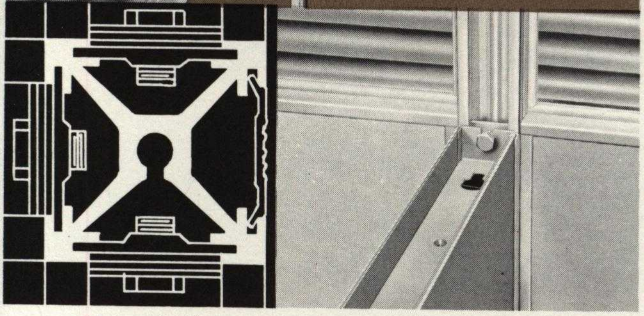


B. Bottom and side molding

All trim and molding used in *Steel Age* Partitions are precut and matched for fit before shipping. Like all other parts, they can be changed and re-used at any time.

**Pat. Pending*





Exclusive

UNIVERSAL POST AND POSITIVE PANEL ATTACHMENT

The *Steel Age* Fiberglass Partition design is the first to permit a completely *practical* rearrangement of partition members. The universal post construction and positive method of panel attachment are chief reasons for this exceptional flexibility.

Only one post style is required throughout any installation to accommodate one-two-three or four-way panel junctions. This same post also serves for electrical outlets and switches at any point in the installation, and will accommodate floor anchors where specified. Each post is conveniently furnished as a prefabricated member to fit the installation.

Panels and posts are joined together by positive, screw connections, and the overlapping trim channel makes the fit continuous from top to bottom of the panel. There are no force-fits, springs or slides to weaken or cause damage, and each part is 100 per cent reusable.

The tubular center of the post receives the post cap and expansion screw at the top, and the leveling screw at the bottom. The leveling screw is then fully supported and cannot tip.

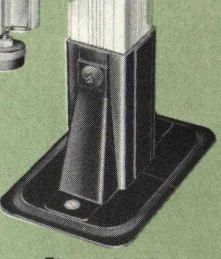
These points of superior design are exclusive with Steel Age partitions:

a. One universal post for any combination of panel junctions and panel heights.

b. Butyrate filler strip . . . universal post cross-section . . . tubular section for cap and leveling screw . . . positive screw connection . . . overlapping trim channel.

Exclusive FLOOR MOUNTINGS

Leveling Foot



Floor Anchor

The advanced design of *Steel Age* floor mountings permits handsome, neatly-aligned installations, regardless of floor conditions. Posts are furnished complete with foot leveling device and attractive plinth. Floor anchors, cups and base enclosures are used where specified.

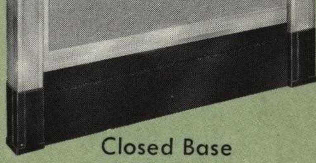
FOOT LEVELING DEVICE—The extra sturdy, 3/8" screw allows a 2" level adjustment and is supported for entire thread length inside post. Screw cannot tip or wobble. A mar-proof, anti-skid pad totally encloses the foot. All steel parts are cadmium-plated for complete protection against washing compounds.

FLOOR ANCHOR—Rugged, two-piece construction does not interfere with height adjustment. Easily attached or removed (no special anchor-post required), anchor is recommended for end-of-run, through long runs and at door openings.

PLINTH—The simplified, two-piece interlocking plinth is made of high-impact polystyrene and eliminates interference with erection or leveling. Easily attached as the *last* step in installation, plinth cannot mar floors and is completely impervious to washing compounds.

CLOSED BASE—Two-piece, vertical telescoping design fits even irregular floor conditions. Positively bolted to bottom of panel and equipped with leveling screws, enclosure can be added at any time.

Plinth



Closed Base

STEEL AGE PANEL STYLES AND SIZES

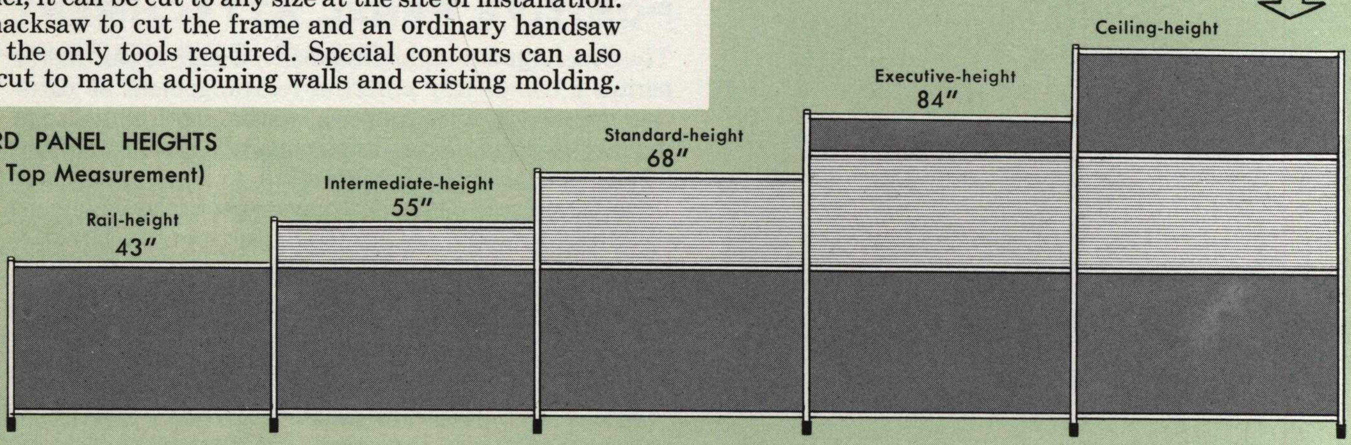
This wide range of panel heights, widths and top styles adds to the unique flexibility of *Steel Age* Fiberglass Partition design. Unlimited office space problems can be solved with combinations of these panel sizes and the *Steel Age* universal post. But *Steel Age* Fiberglass Panels can be readily furnished in custom sizes as well. And because of the homogeneous construction of the panel, it can be cut to any size at the site of installation. A hacksaw to cut the frame and an ordinary handsaw are the only tools required. Special contours can also be cut to match adjoining walls and existing molding.

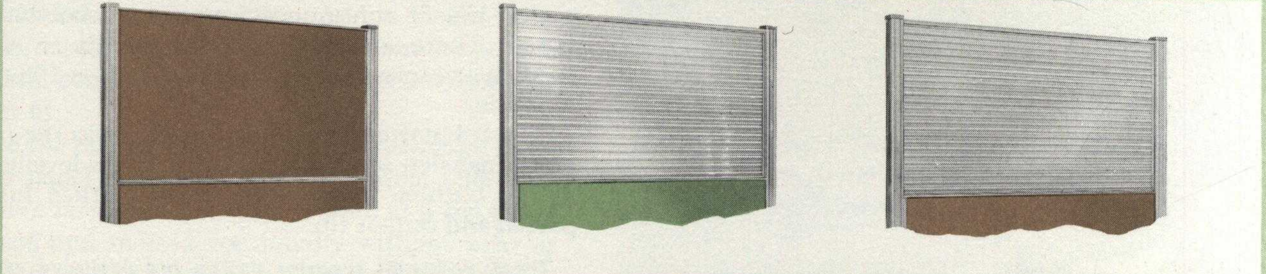
CEILING HEIGHT

Ceiling height partitions are sometimes required to enclose special private offices. To match general installations, *Steel Age* can supply this type of unit, although it is not a typical free-standing partition. Partitions are erected to a maximum height of 114" for this purpose. For greater height, top filler can be added from the partition top to meet the ceiling.

STANDARD PANEL HEIGHTS

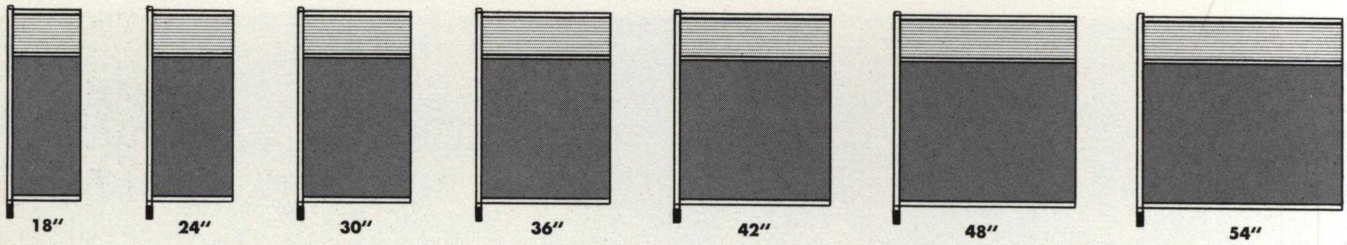
(Floor to Top Measurement)





UPPER PANEL STYLES

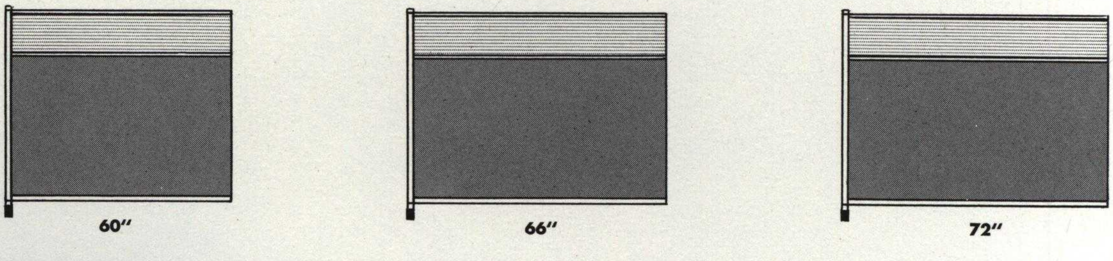
Any of these materials can be furnished, or special materials can be used by purchaser, when required: Clear glass — Translucent, fluted glass — Translucent, fiberglass — Opaque fiberglass panels — Pegboard — Cork board — Acoustical board — Chalk board — Double, sliding glass panes.

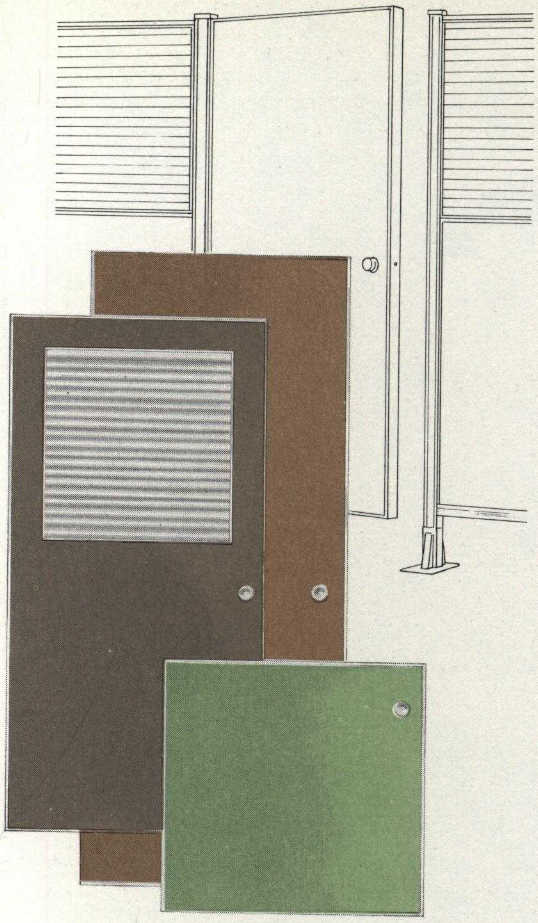


STANDARD PANEL LENGTHS

(Dimension Includes Panel and One Post)

additional sizes include 9", 12" and 62" lengths





GATE (43″ floor-to-top)

FLUSH DOOR (55″, 68″, 78″ standard height—68″ or 78″ Executive-Style)

GLASS TOP (68″ and 78″ standard height, or 68″, 78″ Executive-Style)

DOORS FOR STEEL AGE PARTITIONS

Steel Age Partition doors feature the same fiberglass construction, and share the inherent advantages of the partition panels. All doors can be furnished in three standard colors to match the partitions, or if you desire a distinguishing touch, there are four accent colors available. Contrasting colored panels can be used on opposite sides of any door.

Door panels are a standard 34″ wide to provide room for moving most desks and furniture without up-ending. And—maintaining the flexible design of *Steel Age* Partitions—doors and hardware are completely reversible to allow for rearrangement. Doors can not warp, sag or spring because of sturdy hinge design and rigid door construction.

To match all partition heights and provide optional selections, there are four standard door sizes and ten model variations. Included are flush doors and gates and doors with top panels to match the partition style. (See page 6) Both styles are available in standard or floor-length (floor-to-top) Executive Style.

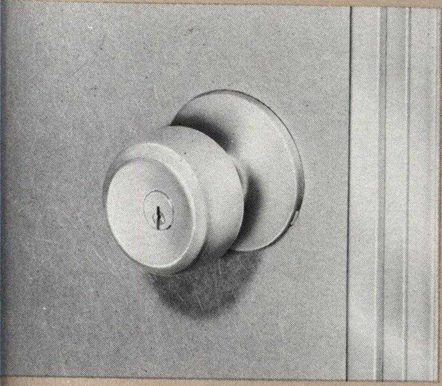
**Other insert materials listed on page 6.*



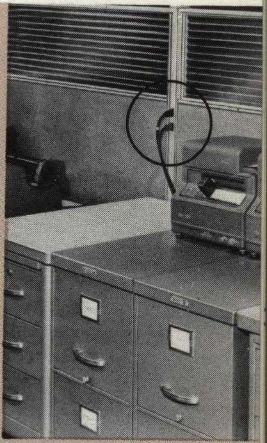
PARTITION HARDWARE

Modern, anodized aluminum hardware gracefully complements the color and beauty of *Steel Age* partitions and doors. Tubular lock sets are standard equipment on all except 43″ height doors.

Neat, concealed-type door hinges are fully reversible and designed for long, maintenance-free operation.

ELECTRICAL WIRING

Here again the complete flexibility of *Steel Age* Office Partitions is evident. Because of the *universal* post design, electrical wiring can be provided on order, or added at the installation site—quickly and easily. And switches or outlets can be located wherever they're needed along base molding or on the post. In many cases, wiring plans need *not* be complete before the partitions are installed.



SIMPLE, FAST INSTALLATION

Simplicity of design means minimum supervision when you install *Steel Age* Office Partitions. Even an inexperienced worker can quickly assemble panels and posts with only two or three simple tools. A layout drawing, accurate shipping list and practical instructions are furnished for each installation. There are a minimum number of parts involved, and each post and panel are prefabricated to match the layout.

Here is the simple, step-by-step method of erecting a *Steel Age* Partition:

STEP 1. Attach panel to post by means of two bolts, inserted into slots at top and bottom of panel end-face, tightening these bolts into post clamps. Note strength of overlapping bolt connection.

STEP 2. Attach second post to opposite end of this panel.

STEP 3. Place horizontal trim channel on top edge of panel. Bottom horizontal trim is then attached by means of two spring clips on bottom edge of panel.

STEP 4. Level partition by adjusting foot leveling devices in post base.

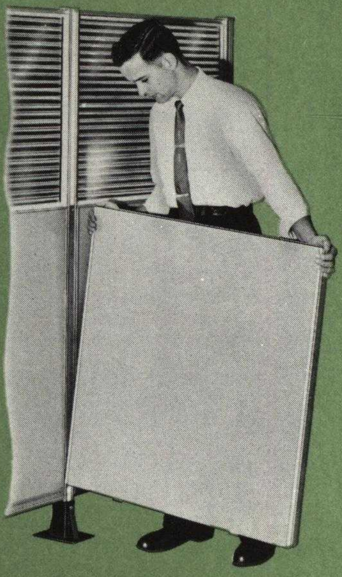
STEP 5. Rest glass in aluminum trim strip at top of panel, at the same time locating the glass into the trim strips on the posts. *(Note:* Glass is positioned from the side—*not* overhead).

STEP 6. Now press the Snap-Lock molding into place at the base of the glass, and on both sides. Only fingertip pressure is required, yet molding *locks* in place, holding glass securely. Note neat fit of molding and miter-like corners.

STEP 7. Place the factory assembled glass molding and top aluminum trim strip on top edge of glass.

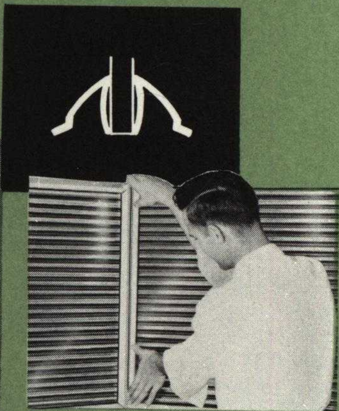
STEP 8. Put post caps into place and secure with expansion screws. *(Note:* Caps, secured in place, hold top trim rigidly in position.)

STEP 9. Finish base of post with two-piece interlocking plinth. By adding plinth last, in this manner, these do not interfere with erection or leveling.



1 Attach panel to post.

5 Insert glass.



6 Secure glass with Snap-Lock molding.

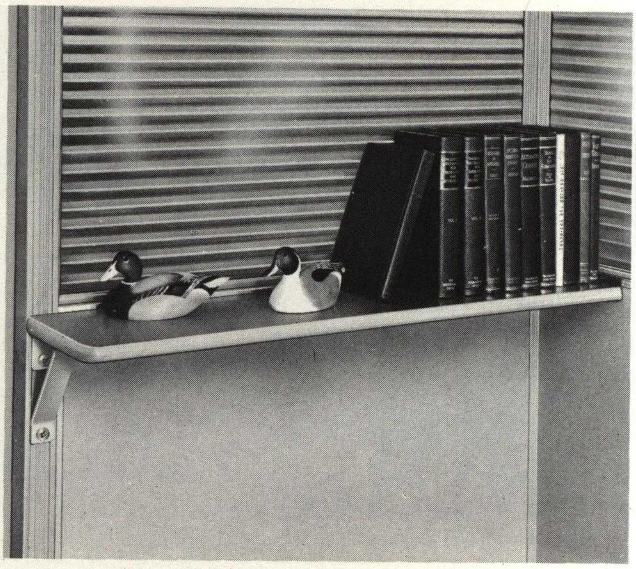
PARTITION ACCESSORIES

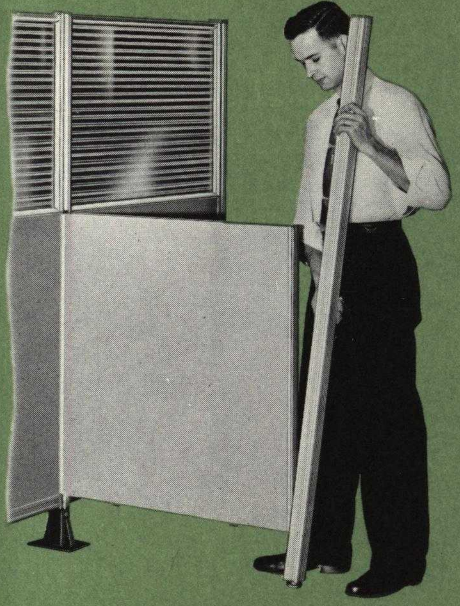
To complete the requirements of many customers, some accessories are available as complements to the finished partition.

Like the basic partition components, these items are designed for appearance and efficiency. Without exception, they can be easily installed where required during, or after, the initial installation.

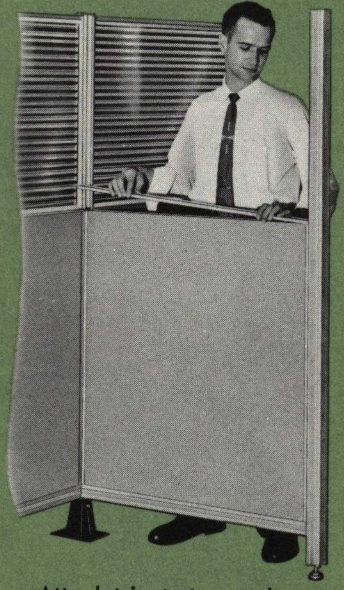
BOOKSHELF

The convenience of having shelf space available is, in fact, doubled by the flexible *Steel Age* design. It permits the shelf to fit between any two posts throughout the installation, and can be located at any desired height. This sturdy, attractive bookshelf is available in panel lengths from 9″ to 72″.

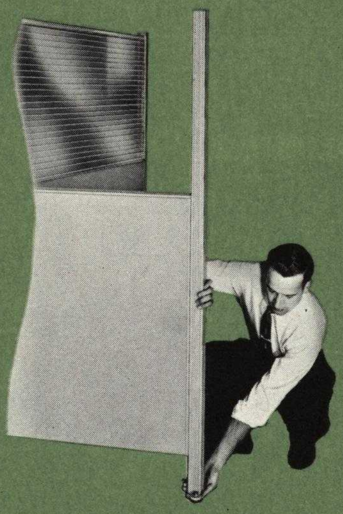




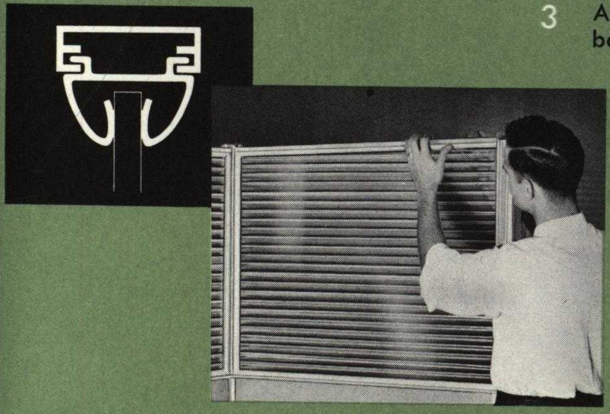
2 Attach second post to panel.



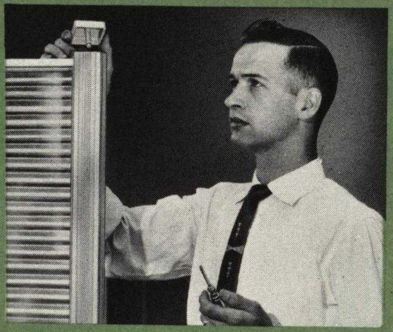
3 Attach trim to top and bottom of panel.



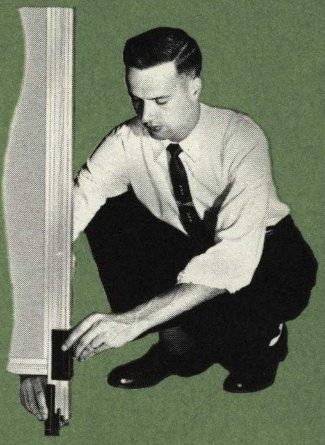
4 Level the partition.



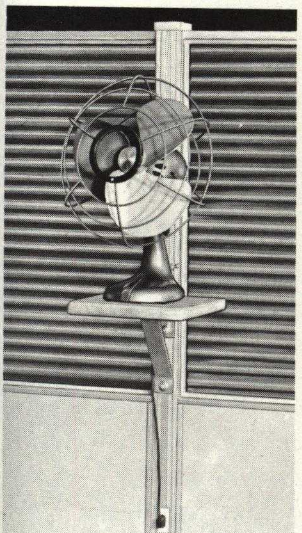
7 Add top molding and trim—lock into place.



8 Put on post cap.



9 Attach plinth.

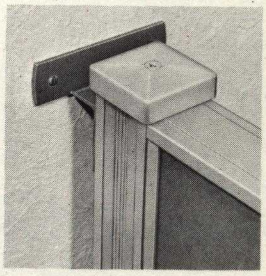


FAN SHELF

Quickly installed, this shelf will support normal-sized office fans, or decorative items, and can be located anywhere on an open-sided post.

WALL BRACKETS

Recommended for use wherever partition run meets a permanent wall structure. These brackets allow partitions to be mounted flush, or spaced up to 6″ from walls.



ELECTRICAL SWITCHES AND OUTLETS

Providing convenient access for office machines, lights, and other electrical devices, these neat-appearing, easily installed switches and outlets can be located at random points on the panel base trim or posts.

SUGGESTED SPECIFICATION

Scope of Work

Furnish and erect STEEL AGE Office Partitions as manufactured by Corry Jamestown Corp. Partitions shall be Rail-height, Intermediate-height, Standard-height, Executive-height and/or Ceiling-height as indicated on the plans and specified hereunder.

Panel Construction

Panels shall be comprised of two sheets of molded fiberglass bonded to #16 gauge steel channel frame and reinforced honeycomb core, to form 1¾″ thick panel. Bonding materials to remain stable to temperatures of 200°F. and to soften at 275°F. minimum.

Upper Panels

Except for 43″ (hand-rail) high partitions, each partition section shall consist of an upper and lower panel. The upper panel shall be available in a variety of materials, such as: clear glass, or fluted translucent glass, peg board, cork board, chalk board, opaque or translucent fiberglass panels, etc. Panels shall be as indicated on the drawings.

Flexible plastic extruded molding shall be provided for securing the transparent or translucent material used above the fiberglass panels.

Top trim over glass panel shall be an aluminum extrusion which provides base for self-locking plastic molding. Hidden brackets shall be used to secure trim assembly to posts at each end.

Shop Drawings

Shop drawings indicating plan, elevation, hardware, and panel treatment shall be submitted to the architect for approval before fabrication.

Panel Colors

Colors of fiberglass used in lower panels (standard or special) shall be molded into fiberglass sheets with pigmented polyester or Hetron (as specified) resin. Colors shall be as shown or as selected by architect.

Post and Trim Construction

All posts and decorative trim molding material shall be extruded aluminum, anodized in natural finish.

Post cross section shall be "X" shape with retaining slots at each side for fitting with flush filler strips or panel clamping plates and glass moldings. Each post shall be universal, not only with respect to its use for attaching any number of panels, but also for provision of electric wiring, attaching floor anchors and other accessories. When partition is completely installed there shall be no visible indication of additional attachment provisions on posts.

Post bottoms shall be provided with an inserted adjustable glide for leveling. Adjustment range to be 2″.

Leveling arrangement at post bottoms shall be covered with a trim plinth of molded, high-impact polystyrene. Plinth shall be of two-piece interlocking construction that may be attached at post base after final leveling operation, electric wiring, etc., has been completed.

A ⅜″ diameter tubular section at the center of post cross section shall provide stable support for bottom leveling screw for its entire length and the adapter socket for locking post cap in place.

Post tops shall be covered with molded acetate-butyrate plastic cap. This cap to be provided with a screw expander to provide positive locking to post.

Attachment of auxiliary shelves, coat hooks, etc., shall be provided on any post side, at any height, by substituting a slide-in clamp plate in post retaining slot for a section of post filler strip.

Post filler strips, used to close in open post side where panel is not attached, shall be extruded butyrate plastic, providing finished appearance and desirable styling effect.

Panel Attachment Method

Panel, complete with vertical trim, shall be fastened to post by clamp screw at upper and lower corners. These screws tighten into clamp plate located within post recess.

Panel clamping screws and access channels at upper and lower panel edges shall be covered with horizontal aluminum trim molding.

Partition Heights

Standard heights from floor to top edge of partition are as follows:

(a) Top of Hand Rail-height partition .... 43″
(b) Top of Intermediate-height partition .... 55″
(c) Top of Standard-height partition .... 68″
(d) Top of Executive-height partition .... 84″
(e) Top of Ceiling-height partition .... to 114″ max.

Panel Lengths

Partitions shall be made of standard panel lengths and shall be interchangeable.

Standard panel lengths including one post shall be 9″, 12″, 18″, 24″, 30″, 36″, 42″, 48″, 54″, 60″, 62″, 66″, 72″.

Special lengths shall be made from the next larger standard size panel, either at installations site, or at factory.

Special irregular contours to panel ends for direct joining with walls, etc., shall be made, either in field or at factory.

Corrosion Resistance

All exposed surfaces of the partitions, (fiberglass panels, aluminum extruded posts, molding pieces, and plastic filler strips) shall be completely corrosion proof by the nature of the materials used. No finish coatings of any kind are to be used, with the exception of floor anchors and closed bases, which are of heavy gauge welded steel phosphatised, and finished with a durable baked black enamel.

Electrical Wiring

Easy installation of electrical outlets on post at any height, and on lower panel molding channel shall be provided for, either at factory before original installation, or at any subsequent time, after installation is complete. No special posts or molding pieces shall be required.

Floor Anchors

Floor anchors shall be provided for posts on both sides of doors and intermittently, where required by good partition practice. Anchors shall be so designed that they may be easily attached or removed, that height adjustments may be effected.

Doors and Door Hardware

All doors shall be flush doors, 34-inches wide, of the same construction as the partition panels unless noted otherwise on plans. Trim and hardware shall be aluminum anodized in natural finish. (All doors except 43″ height fitted with key lock.)

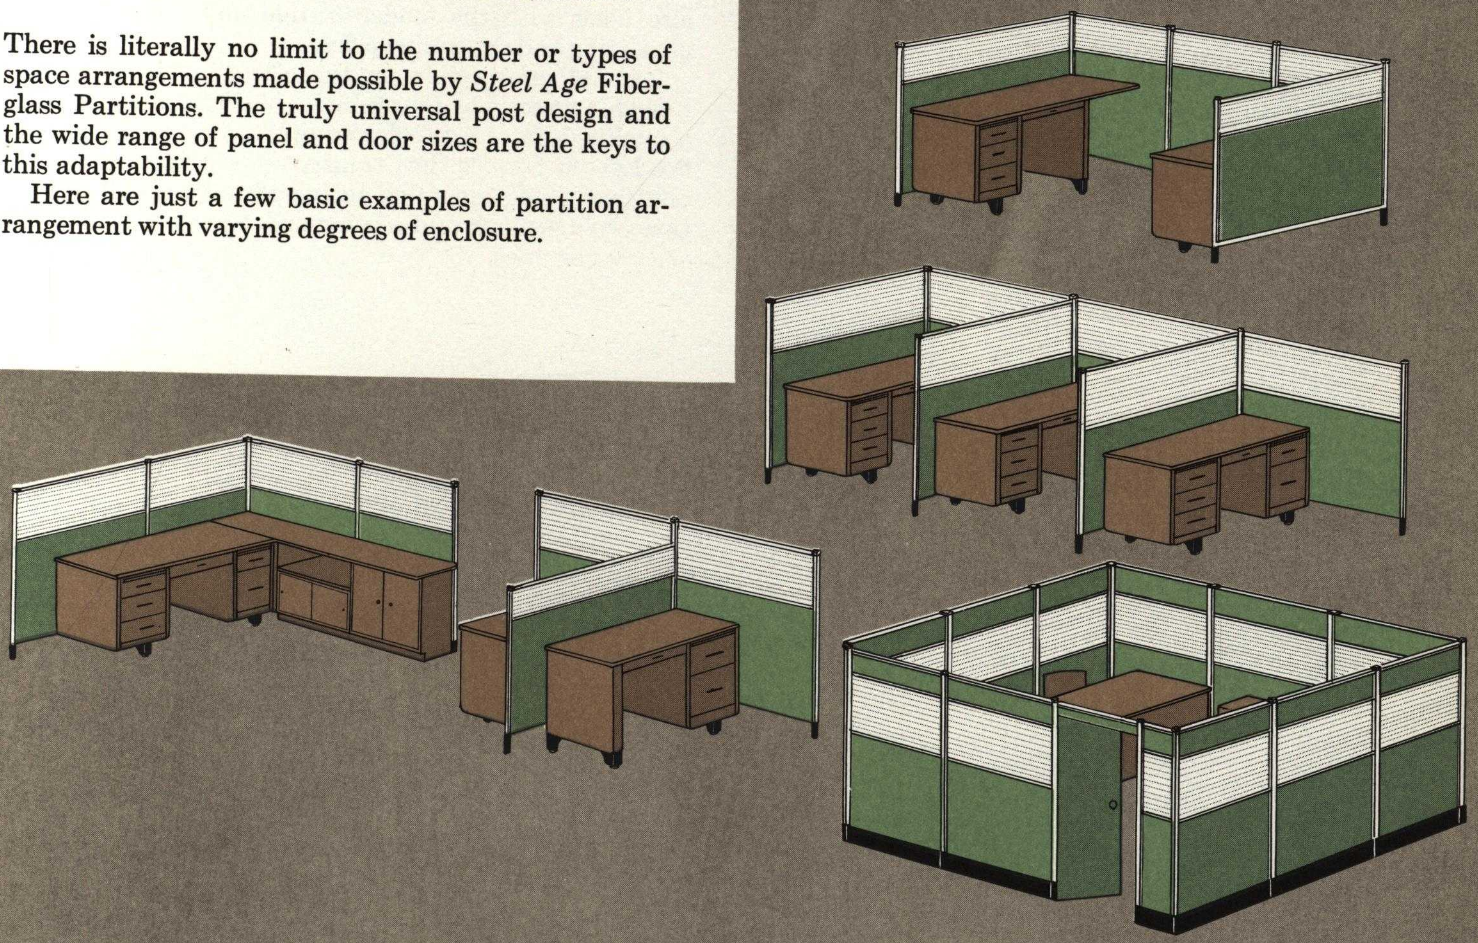
Panel Weight

Due to highly developed honeycombed core and fiberglass construction, rigidity and durability are obtained with minimum weight (approximately 2½ pounds per square foot). This greatly facilitates handling for both shipping and erection and provides minimum floor load weight.

EXAMPLES OF ARRANGEMENT

There is literally no limit to the number or types of space arrangements made possible by *Steel Age* Fiberglass Partitions. The truly universal post design and the wide range of panel and door sizes are the keys to this adaptability.

Here are just a few basic examples of partition arrangement with varying degrees of enclosure.



LAYOUT PRACTICES FOR FREE-STANDING PARTITIONS

Avoid long straight runs, unsupported by corners or "Tees". Floor anchors should be used for runs greater than 15 feet in length.

Intermittent use of floor anchors is recommended where there are more than 3 panels between corners.

Proper coordination of desks and furniture and proper division of space will provide ample "cross runs" and eliminate long, unsupported runs.

In planning for doorways in partitions less than 84″ high, (no fixed header above doorway) floor anchors, corners or "Tees" should be planned for, to preclude binding or springing of doors. (Allow 34⅛″ for door opening)

Floor cups are recommended to prevent inadvertent misalignment of partition installation. Adhesive is recommended for attaching cups to avoid marring floors, however, guide studs or screws may be used.

Because few permanent walls are plumb, and space usually is allowed for baseboard pipes and molding, wall brackets are recommended where partition post is adjacent to wall. Proper space between post and wall usually is from ¾″ to 1½″. Where flush wall bracket is recommended, add ⅛″ for thickness of bracket.

Do not use partition heights in excess of functional requirements. 43″ height divides space but affords complete visual control, even from seated position. 54″ height provides semi-privacy and eliminates visual and some audible distractions to seated worker . . . but permits supervisory control. 68″ height provides complete visual privacy. 84″ height provides additional sound level reduction.

STEEL AGE OFFICE LAYOUT SERVICE

Steel Age maintains an experienced staff which devotes full time to office planning and layout. Their very specialized knowledge is offered as a free service in connection with the installation of *Steel Age* office furniture and partitions.

This Office Layout staff is trained to relieve the busy architect of lengthy detail work, and to help business firms plan attractive, well organized offices. In addition to the design of new office space, this department also deals with the modernization and improvement of existing and expanding offices.

General information on the office involved can be provided directly by the architect or submitted through a qualified *Steel Age* office equipment dealer. The Office Layout Service then transposes this data into specific floor plans, including notes on furniture and partition arrangements and recommendations for color and office accessories.

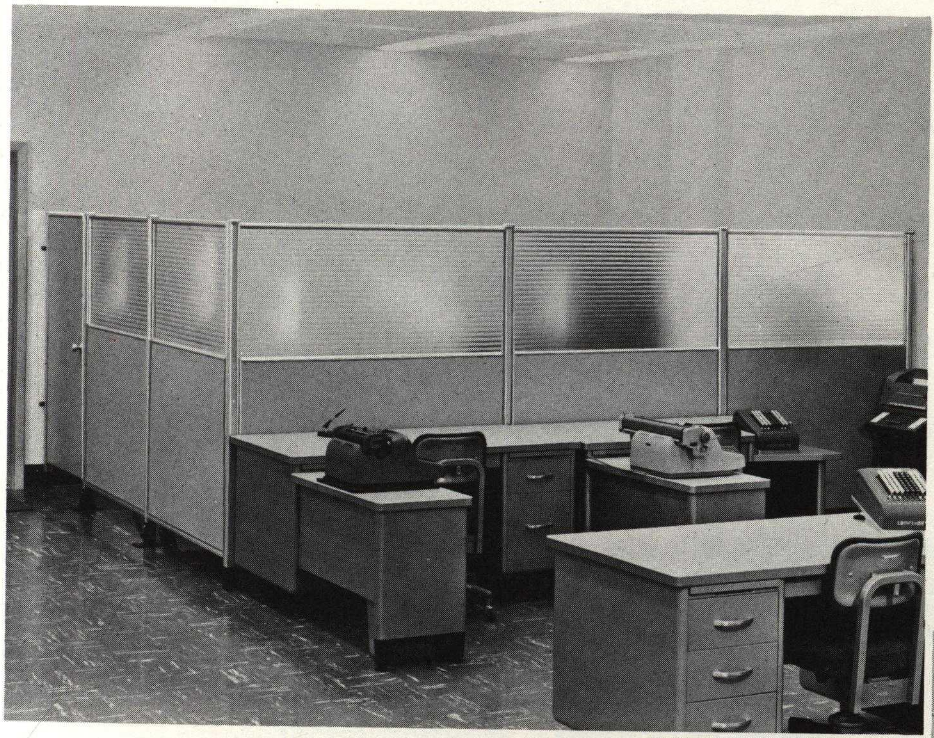
from a rough sketch . . . to an accurate, detailed layout

MATERIALS AND COLOR PANEL FURNISHED WITH DETAILED PLAN.

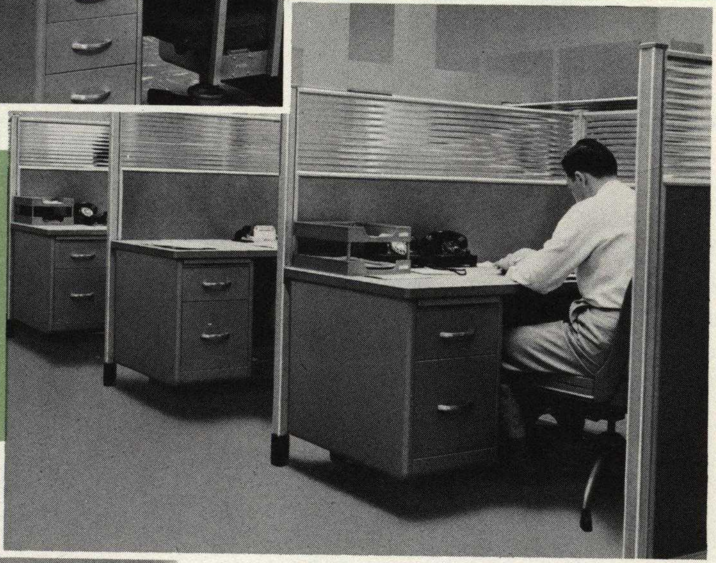
HERE'S HOW OFFICE PLANNING WORKS

The success of any office planning project depends on the completeness of the information that can be supplied. Information should include a brief description, generally outlining job functions and titles, along with any rough sketches submitted. In the case of major new construction, or the expansion of existing quarters, the architect's plan of the space should be submitted. Pertinent dimensions and notes on locations of windows, heaters, telephones, and any other more or less "permanent" features are very important. Where a revision of existing space is to be considered, a rough sketch will suffice as long as this same data accompanies it.

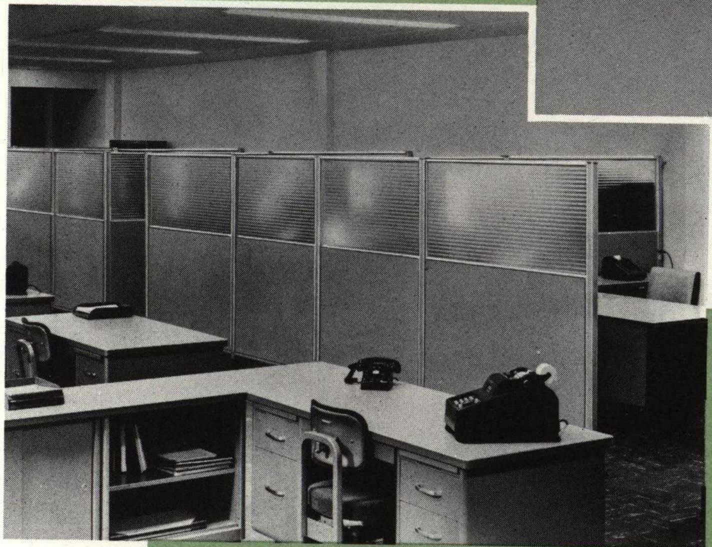
Through the Office Layout Service, completely professional office planning is now available not only to the architect faced with a tight work schedule, but also the businessman without trained personnel or proper facilities for this function. To the businessman particularly, this is a valuable service, offered without cost.



Installations of *Steel Age* Office Partitions showing well planned, functional divisions of space. Note the varying degrees of privacy achieved.



A private office easily created from available floor space. Privacy and a desirable touch of prestige are important aids for supervisory personnel.



Space-saving compartments make it easier to concentrate, control office traffic.

A smart, attractive appearance goes hand in hand with office order and efficiency.

The Perfect Partner for

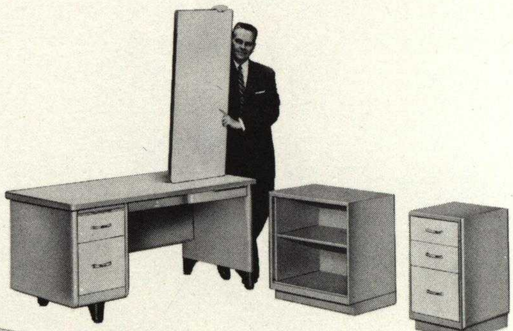
Corry Jamestown Fiberglass Office Partitions

MODULAR CORRELATION FURNITURE

Matched in Flexibility

Matched in Functional Efficiency

Matched in Fine Craftsmanship



The flexibility and adaptability of the Correlation line is unequalled. You can *start* with basic units and *add* to them later . . . or, you can create custom groupings you need at the outset. At *any* time you can add or expand . . . or rearrange to suit the job needs (just as you can with Fiberglass Office Partitions). Many distinctive optional features, and a wide choice of colors, makes it possible to outfit an office from "top to bottom" with Correlation . . . always suiting the job and the person just right.

COUNTER EQUIPMENT • FILES

The Corry Jamestown line of quality office furniture features a variety of efficient counter units and a complete range of types and sizes of filing cabinets.

WORKWALL

MOVABLE PARTITIONS
AND PANELING

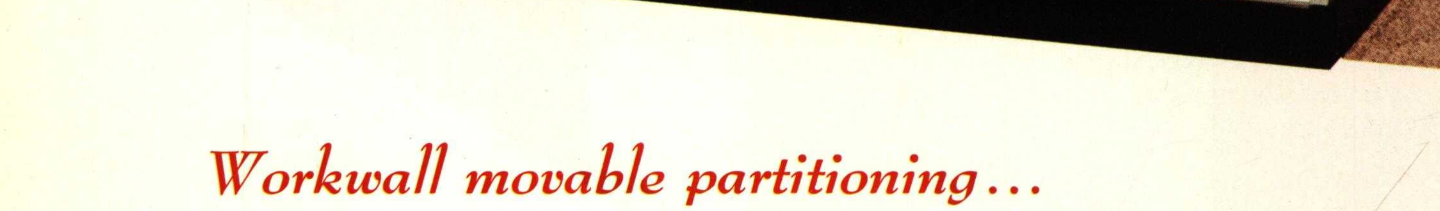
DIVISION OF L. A. DARLING COMPANY • BRONSON, MICHIGAN

DARLING

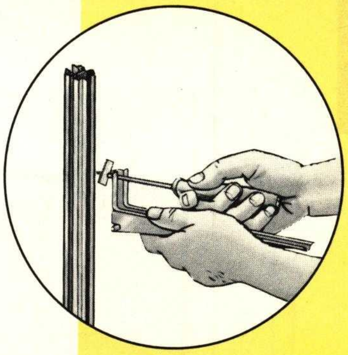
Workwall movable partitioning...

offers a fresh new concept in functional space division

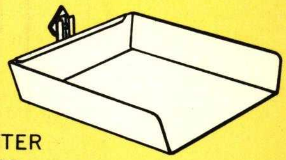
Designed to combine beauty, economy and complete flexibility, Workwall also offers an added advantage... an exclusive feature that actually puts the walls to work, providing a more functional work area in a minimum of space. Aluminum posts and Plastic finished or Natural wood panels are designed for ease of installation with a minimum loss of floor area, low maintenance costs, and complete reusability when relocation is desired.



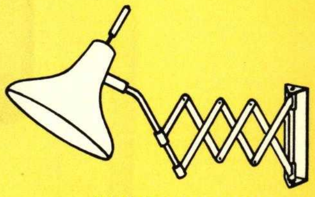
Typical Partition Elevations Showing Various Arrangements in All Heights



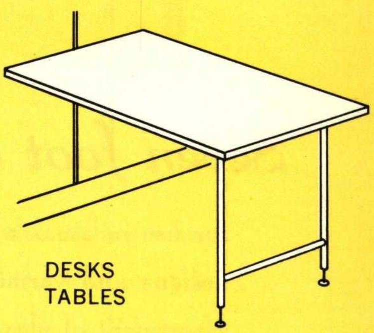
All Workwall attachments lock securely into position in post channels with the twist of a screwdriver.



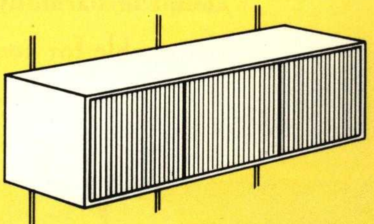
LETTER FILES



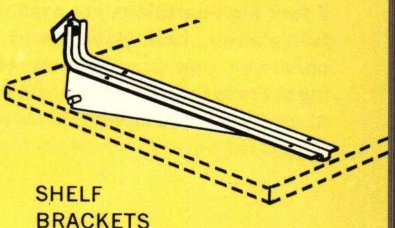
LIGHT FIXTURES



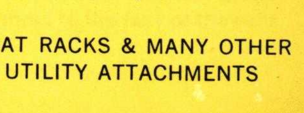
DESKS
TABLES



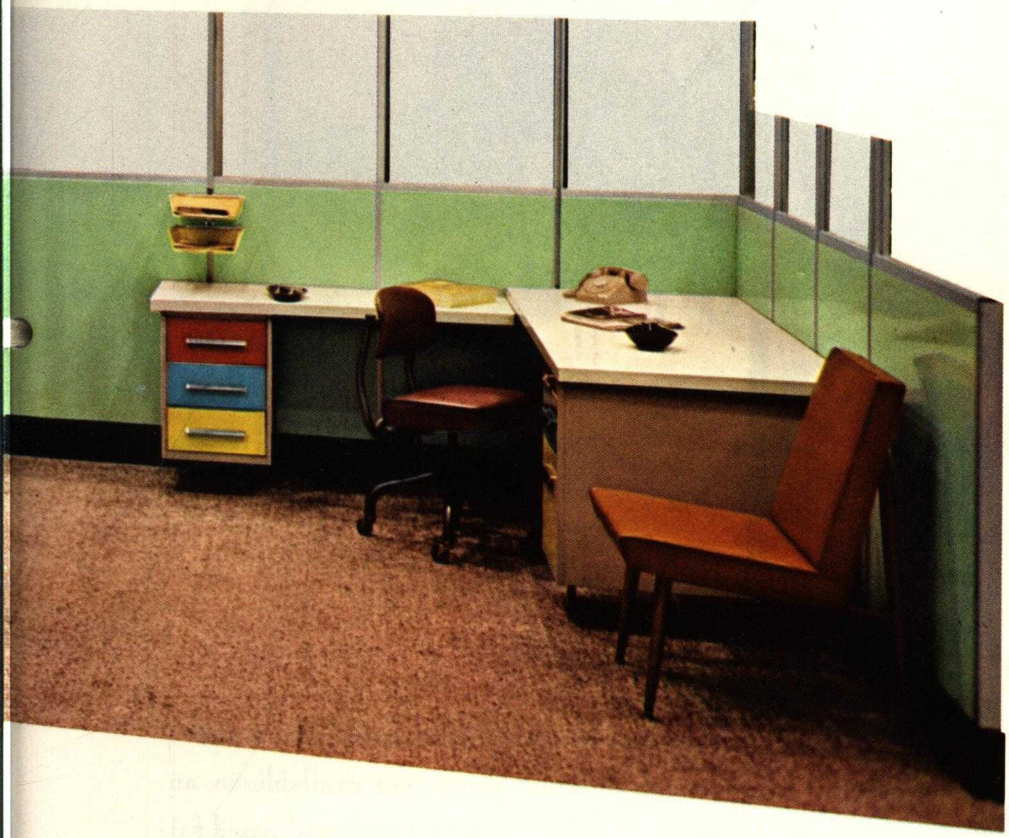
CREDENZAS



SHELF
BRACKETS



COAT RACKS & MANY OTHER
UTILITY ATTACHMENTS



Workwall's patented locking principle...

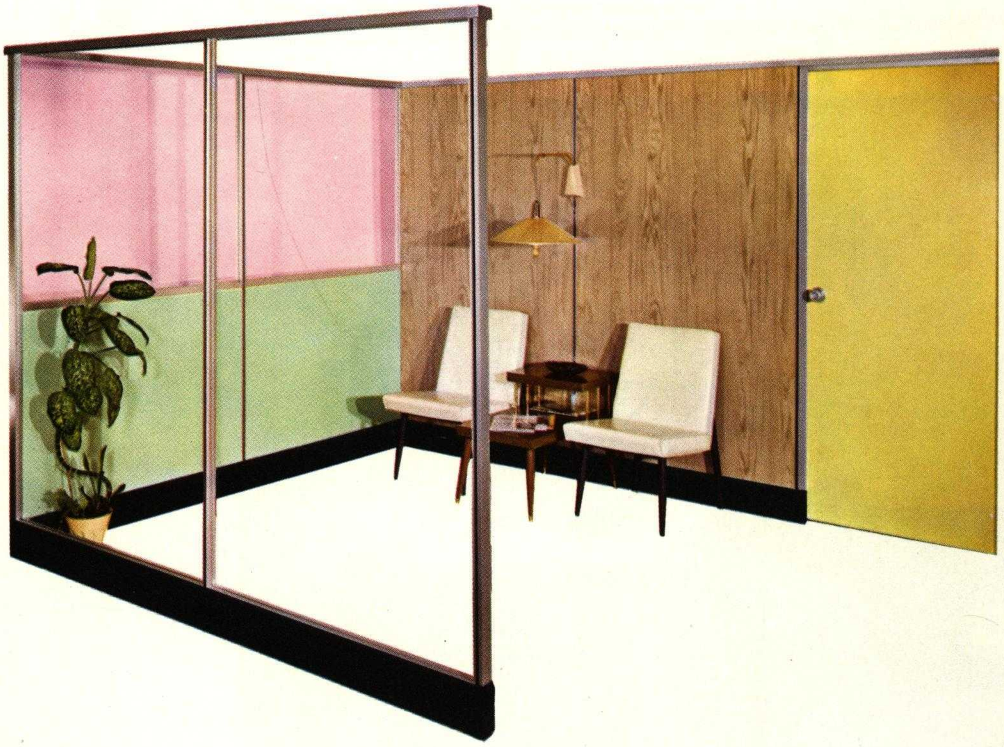
permits all types of utility attachments to be locked into post channels, without defacing the walls in any way. Table and desk tops, cabinets, shelving, letter files, pictures – even floor vases, lighting fixtures and many other attachments go on and come off with the simple twist of a screwdriver.

Work wall channels brackets and wall attachments are the same type as those used in Darling's famous Vizusell store merchandising system. The Vizusell system of channels and attachments is fully protected by U.S. Patent 2,744,714.

WORKWALL movable partitioning

DIVISION OF L. A. DARLING COMPANY • BRONSON, MICHIGAN

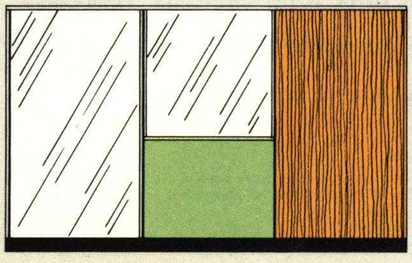
DARLING



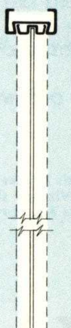
Seven foot high partitions...

for use in areas where complete privacy is not required ... available in a choice of attractive designs and variations. Beautiful, Plastic finished or natural wood panels are available in an assortment of pleasing pastel colors and natural wood grain finishes ... all colors coordinated for complete harmony when used in combination. Doors and panels of like dimensions are interchangeable for complete flexibility.

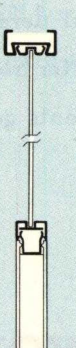
7 foot high partitions are available in full glazed, half glazed and solid panels for semi-private areas. Matching fillers to ceiling can be easily added at anytime for complete privacy.



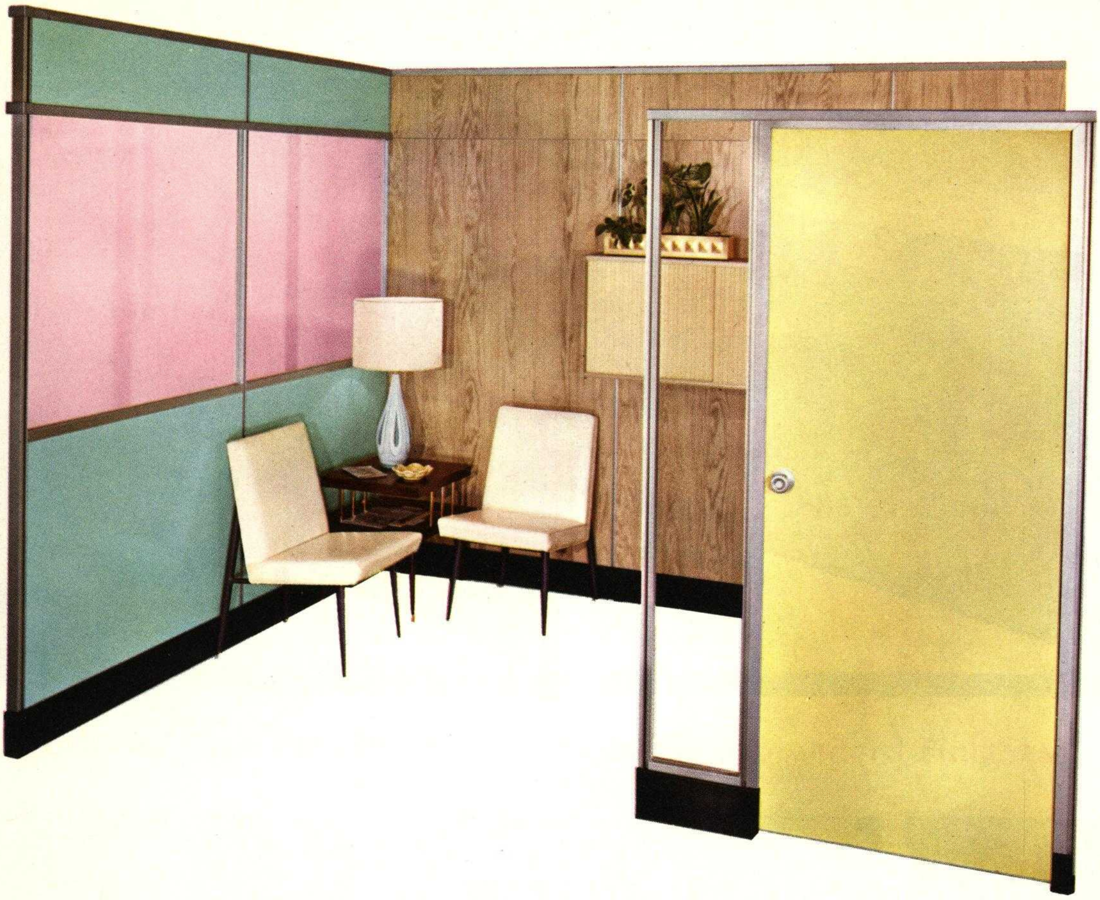
Simplicity of design is basic throughout the Workwall system, incorporating a minimum of parts for construction ease and flexibility ... thus assuring low labor costs on both the initial installation and future rearrangements.



FULL GLAZED PANEL

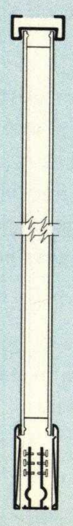


HALF GLAZED PANEL

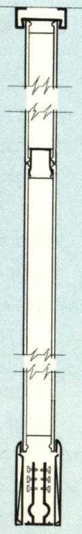


Ceiling high partitions...

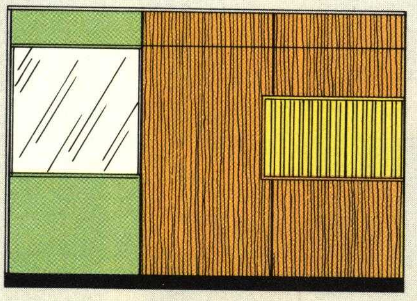
84″ or 96″ high glazed or solid panels are used with a matching filler to the ceiling where complete privacy is desired. Sound transmission is kept at a minimum with the unique cellular core construction of Workwall panels. The omission of the cornice strip on the solid panels leaves but a hair line between panel and ceiling filler giving the appearance of a solid wall from floor to ceiling.



SOLID PANEL
WITH CORNICE



SOLID PANEL
W/ CEILING FILLER

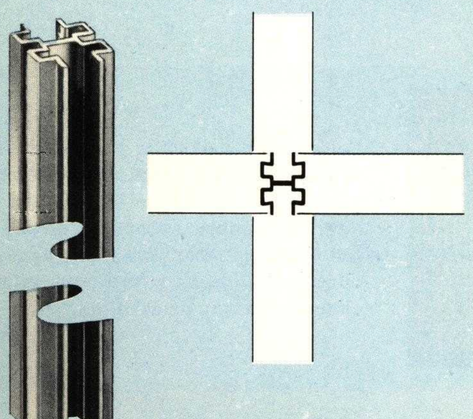


Ceiling high partitions are available in glazed or solid panels and, like all Workwall units, they are completely interchangeable. Attractive and usefull Workwall credenzas are easily constructed and locked into post channels at any desired height.

Ceiling filler panels are pre-cut to fit each installation and contain the same construction and low sound transmission qualities as the standard panels. Full allowance is made for all practical types of concealed electrical wiring and special clips are available for locking standard plug mold to the face of thewalls at any desired height.

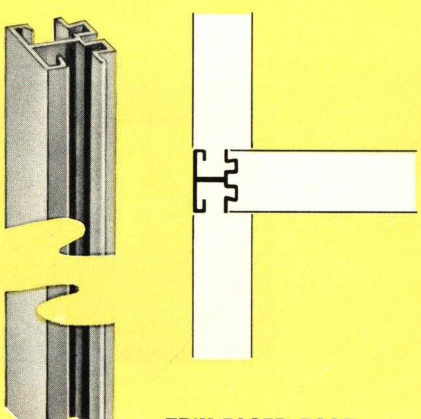
Rail high space dividers...

where space division is required in general office areas, Workwall offers partitions in three standard heights combining the ultimate in beauty, flexibility and economy. Panels can be added, omitted, or rearranged in a matter of minutes to accommodate changes and variations in procedure.



STANDARD POST

The Standard Post is used as an intermediate post or may be used as a 3 or 4 way post by using the optional connecting key (#537) as shown on page 7.



TRIM-FACED POST

The Trim-Faced Post is used as an end post or may be utilized as a corner or 3 way post by using the optional connecting key as shown on page 7.

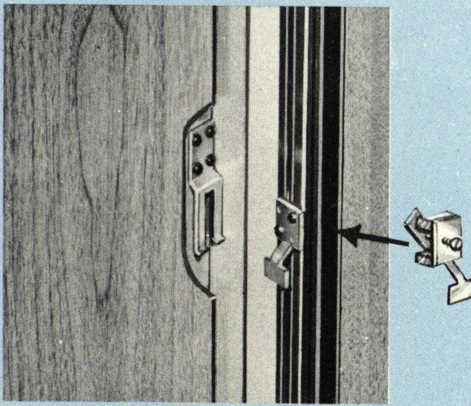
ONLY TWO BASIC POSTS ARE NEEDED WITH THE WORKWALL SYSTEM...

Keeping the number of posts and component parts at a minimum offers distinct advantages . . . ordering, inventory control and installation are simplified and greater economy and flexibility are possible with Workwall.

All posts are equipped with standard floor anchors and levelers.

Workwall Partitions are easy to assemble — divide space with a minimum loss of floor area . . .

Posts and panels snap-lock together (without the use of special tools) to form sturdy free standing or floor to ceiling partitions. The narrow (1¾″ thick) panels can save many square feet of valuable floor space as compared with other methods of construction.



Simple locking sleeves on the panels slip over connecting keys on the posts and lock tightly into position. For corner, 3 way and 4 way returns an optional connecting key (#537) locks into the post channel with the twist of a screwdriver and panels can then be secured in the above manner.

SOUND CONTROLLED PANEL CONSTRUCTION

Exclusive cellular construction provides light weight partitions of exceptional strength and excellent sound reduction characteristics.

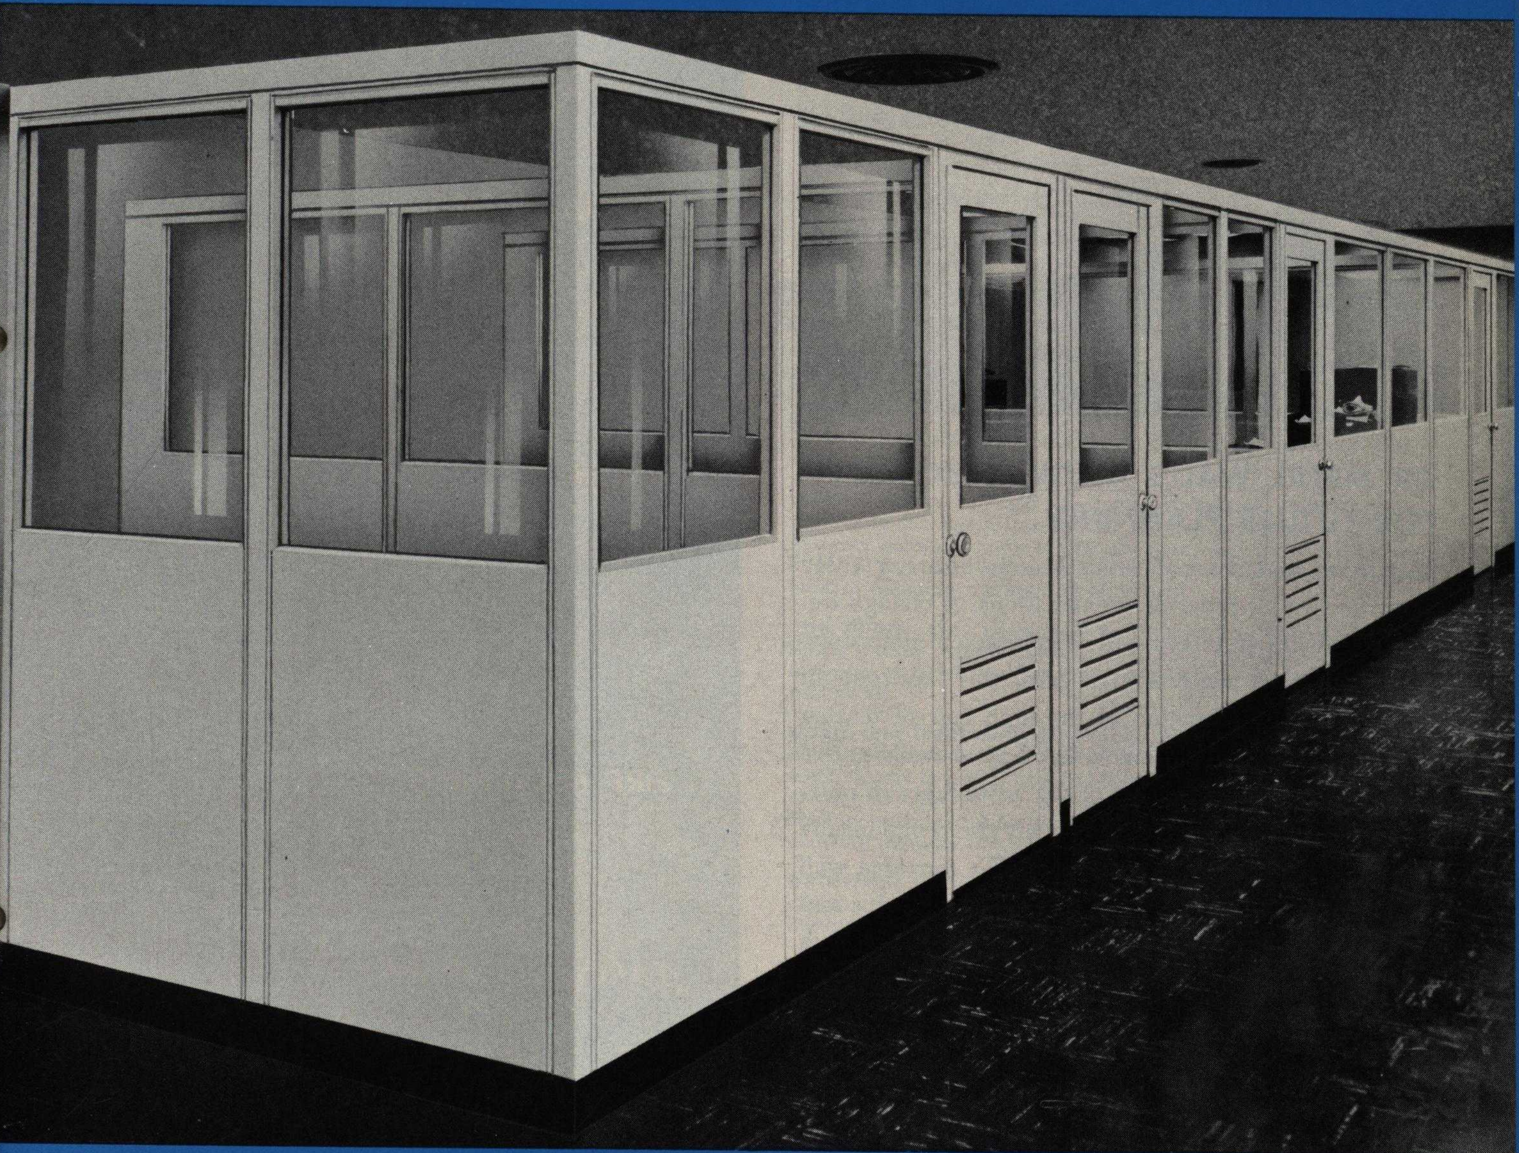
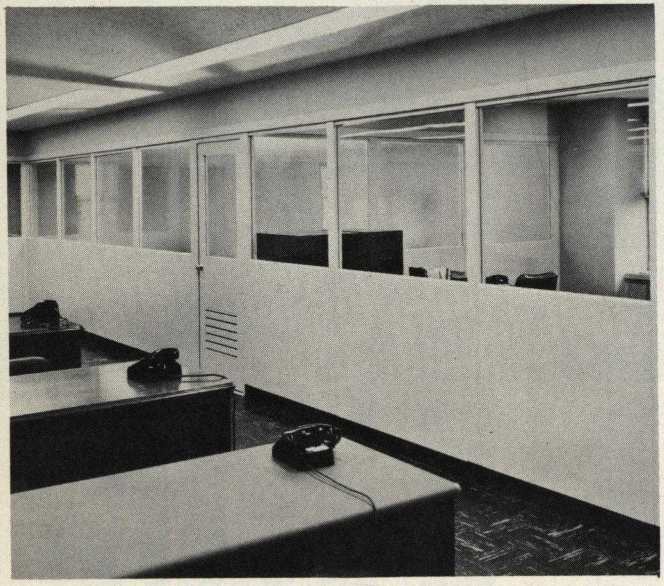
GR METAL WALLS



Adjust to changing needds

Quickly...economically

GR | PRODUCTS INC.
Steel Division — 47-01 35th St.
Long Island City, New York



GR METAL WALLS ALLOW FLEXIBILITY FOR FUTURE PLANNING

Expansion and diversification has become vitally important to all types of organizations. A change frequently makes an increase in office space or rearrangement of offices necessary. In turn, this has brought about a wider realization of the high cost of tearing down and rebuilding conventional type walls and a rapidly growing acceptance of the advantages of movable walls which can be easily, quickly and economically adapted to changing requirements. The movable wall concept is in perfect step with modern conditions and the modern trend toward greater efficiency through maximum flexibility. Recognizing the importance of functional design, GR engineers have developed movable walls which offer the user many practical advantages as well as the satisfying architectural effect of contemporary interior design.

GR METAL WALLS REDUCE CONSTRUCTION COSTS

The building owner can realize a substantial savings in construction costs with GR Metal Walls. They are shipped complete . . . installation time is at a minimum and work area occupancy after erection of the panels is immediate. In new construction the weight of sturdy, rigid GR Metal Walls is less than conventional construction and, as a result, normal building dead loads are reduced as well as the costs involved in structural framing.

10 YEARS OF "KNOW-HOW"

Over 10 years of experience in the fabrication of movable walls and partitions, plus an organization ever alert to modern requirements of industry make it possible for GR to offer continually improved metal walls. Yet these changes in design and erection methods have not been so radical that matching additions to or changes to present installations at a later date are unfeasible.

MODULAR SIZES

GR movable walls are planned in modular sizes which meet the demands of all normal partitioning problems. Fillers and accessories permit adaptability to any type construction and, in instances of unusual space requirements, GR can fabricate special sizes.

FINISH

Two coat baked enamel gives a lifetime finish. This combined with flush lines, provides walls which are easily maintained by ordinary methods. GR Metal Walls are immediately available in a wide selection of standard colors or can be furnished promptly in the color of your choice.

FIRE RETARDING

All frames, panels, cornices, and bases, as well as the glass wool interior lining are of incombustible materials which greatly reduce fire hazards.

EARLY OCCUPANCY

Overhead is reduced by utilizing valuable office or factory space within hours after the panels are erected. There are no costly delays waiting for plaster or paint to dry.

INSTALLATION BY GR . . . ADVISORY SERVICE

To assist you in planning, GR offers the experienced services of its specialists and design engineers. To assure perfect installation GR trained crews are available at strategic locations throughout the country. GR traveling installation supervisors are also available to provide any initial instruction which will enable regular maintenance personnel to install or move GR walls as required.

SPECIFICATIONS

flush type—"B" series and "C" series

Contractor shall furnish and install complete, GR Metal Partitions (Architect: Indicate "B" Series 3″ thick, or "C" Series 2⅜″ thick) as manufactured by GR Products, Inc., Grand Rapids, Michigan.

construction: Partitions shall be assembled from post and panel units of the same thickness and be completely flush across the face of the partition. Partitions to be of hollow metal construction. Panel and door units shall be interchangeable with units of the same size. Units to be manufactured in 6″ increments from 12″ to a maximum of 48″ for solid partitions and 60″ maximum for glazed type. All measurements to be made to centerline of posts. (5″ module available on special order.)

panels: Panels shall be constructed of #20 gauge, cold-rolled, stretcher leveled, steel sheets with horizontal channel reinforcements spot welded to back face of panel. Panels shall be completely packed with rockwool and factory assembled by bolting to #18 gauge post legs. Panel thickness shall be 3″ (for "B" Series) or 2⅜″ (for "C" Series).

posts: Posts shall be composed of the two vertical legs of adjacent panel units rigidly connected with #12 gauge friction type clips. A #18 gauge snap-on pilaster shall provide a closure between the two legs. Pilaster to be readily removable for access to the wireway thus created.

base: Base to be 6″ high and formed of #20 gauge steel. Base shall be slip-on type and readily removable for access to wireway. Base sections shall be individual for each panel unit and adjustable to meet floor variations. Continuous base available on request.

semi-flush type—"D" series

construction: Semi-flush type partitions shall have 3″ thick posts and 2″ thick panels to obtain a paneled effect. Partitions shall be hollow metal construction. Panel and door units shall be interchangeable with units of the same size. Units are to be furnished in 6″ increments from 12″ to a maximum of 48″ for solid partitions and 60″ maximum for glazed type. (5″ module available on special order.)

panels: Panels shall be constructed of #20 gauge, cold-rolled, stretcher leveled, steel sheets with horizontal channel reinforcements spot welded to back of face panels. Panels to be completely packed with rockwool and factory assembled by bolting to #18 gauge post legs. Panel thickness 2″.

posts: Posts shall be composed of the two vertical legs of adjacent panel units rigidly connected with #12 gauge friction type clips. Post thickness 3″. #18 gauge snap-on pilaster shall provide a closure between the legs. Pilaster to be readily removable for access to the wireway thus created.

base: Base shall be 2″ high and formed of #20 gauge steel. Base to be individual for, and fastened to, each panel unit. Vertical adjustment to be provided to meet floor variations.

OPTIONAL ACCESSORIES

Wickets and grilles, hinged or fixed, sliding doors, clutch doors, fire hose cabinets, window embrasures, transoms, column covers, wainscoting, closets and louvers in panels may be specified.

sound absorption: Where the desire is to reduce the noise level in rooms, perforated acoustical panels in all heights of "B" Series may be specified on one or both sides. "C" Series available perforated one side only.

dust proofing: Where it is desired that partitions be dust proof, architects should specify as follows: Doorways shall be provided with thresholds, all doors shall be provided with wipers and all connections at walls, columns, floors and ceilings shall be sealed to provide a dust proof installation.

light proofing: Where it is desired that partitions be light proof, architects should specify as follows: Doorways shall be provided with thresholds, all doors shall be provided with wipers and all connections at walls, columns, floors and ceilings shall be sealed to provide a light proof installation.

maximum sound control: Solid partitions to the ceiling have a sound transmission loss of 42 decibels. When glass panels are used, to insure maximum transmission loss, double glazing may be specified.

fillers to ceiling: Specify fillers from crown to ceiling where desired.

a. Double Mineral Board, taped, spackled and painted to match partitions.

b. Double #20 gauge steel sheets inserted into ceiling channel (packed with rockwool if desired).

c. Single sheet steel ceiling filler.

(Steel fillers **(b)** and **(c)** to be factory finished to match partitions.)

GENERAL SPECIFICATIONS

General Specifications apply to all series partitions and should be added to the specifications of each series.

plinths: Plinths shall be formed of #18 gauge steel and shall be individual for each post. Plinths shall be snap-on type which are readily removable for access to wireway.

crown: Crown shall be a rolled #18 gauge steel member giving rigidity to the panel installation. Crown to provide continuous wireway across the top of the partition, and for receiving top filler. A concealed splice plate shall be provided at each crown joint to maintain rigidity and alignment.

end fillers: End fillers shall be composed of two #20 gauge sheets packed with rockwool. End filler panels to be inserted into wall channel members and assembled in the field to insure perfect fit.

doors and frames: Doors shall be of #18 gauge steel, hollow metal construction, and shall be completely packed with rockwool. Doors to be 1¾″ thick of solid type, with lite, with louver, or with both lite and louver as specified. Adequate reinforcement shall be provided for hardware. Frames to be of the floating type allowing adjustment to insure perfect door operation.

hardware: Hardware shall be GR Products standard hardware latch or lock type as specified, (or architect may specify any hardware desired.)

glass rails: Glass rails to be formed of #20 gauge steel. Top rail to have one friction stop which is removable to permit installation of glass.

glass and glazing: Glass shall be GR Products standard ⅛″ clear or obscure glass as specified, (architect may specify any glass desired). Glass shall be bedded in putty and back puttied. Color of putty shall match partition color.

finish: All exposed surfaces are to be thoroughly degreased and dried before painting. First coat shall be a metal primer and second coat to be baked-on enamel of color selected, eggshell texture.

bracing: Less than ceiling high partitions with no lateral support for 20 ft. or more, shall be braced to the ceiling.

shop drawings: Four copies of shop drawings showing layout, typical elevations and any special conditions shall be furnished for approval before proceeding with work.

The finished work shall be strong and rigid, neat in appearance and free from defects. Partitions shall be erected plumb and true and free from lateral movement in conformance with the highest standards of the industry.

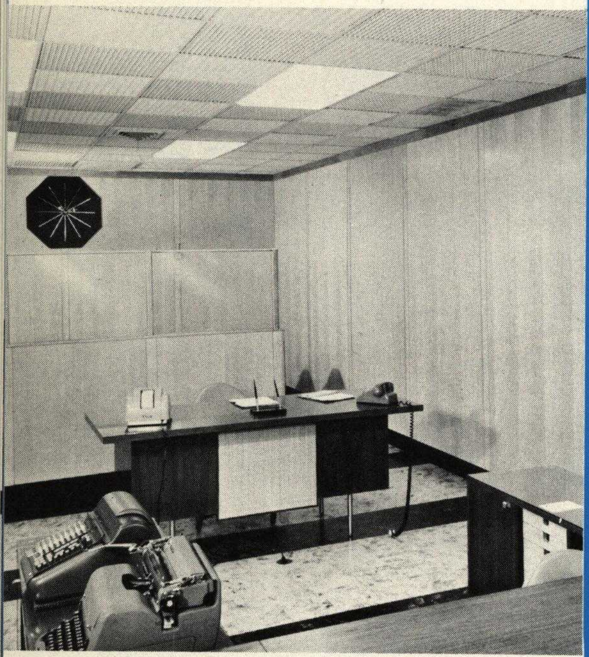
GR Richland

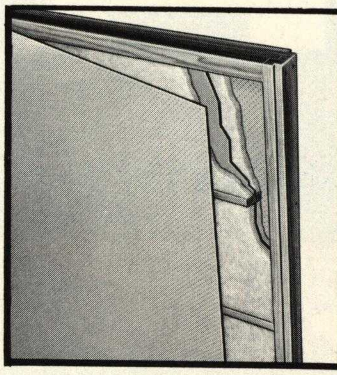
One Matching Design for Varying Requirements in the Same Office

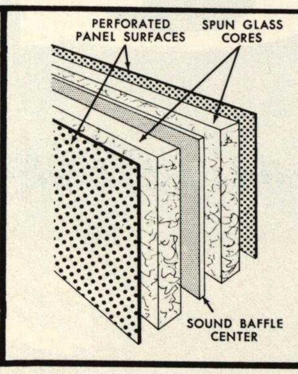
Engineered with one basic wood frame the Richland movable wall system permits a choice of wall surfaces to fit any special requirements – Executive offers plush offices for top management, Soundex for relief in noisy areas, Budgex for general offices or Full Glass for lobbies and halls. Richland panels are 100% salvageable, easy to install, easy to move – and permit easy access for service maintenance. The interior construction, frames, fastenings, leveling devices, cap and base construction of all Richland walls are identical except the Soundex type which features the "floating" acoustical core. Panels join flush with the pilaster presenting a smooth wall surface broken only by a hairline at pilaster. Choice of panel heights from 42″ bankrail to 10′ . . . in 2′, 3′, 3′6″ and 4′ widths. Panel frames braced at 12″ intervals. Panels when joined are securely fastened together by 2″ square metal rings. Pilaster clips to rings, forming flush wall surface. A new type leg bolt eliminates shimming and allows the wall to follow the contour of the floor. A recessed base lifts into wall, then drops into base rail for secure positioning without clips, screws or bolts.



MOVABLE WALL SYSTEM

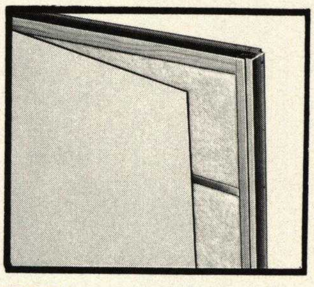
A SURFACE FOR EVERY PURPOSE





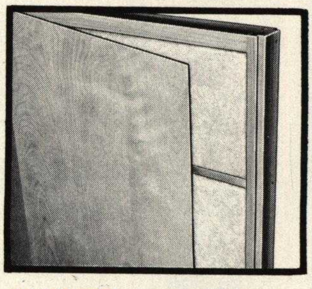
SOUNDEX— Panels 2 ¾″ thick

Soaks up noise as a sponge soaks up water. This partition differs from others shown in that it is an acoustical sandwich formed of perforated surfaces plus acoustical spun glass on both sides of a mineral board baffle. It absorbs and blocks noise. Choice of Sunrise Tan, Spring Green, Morning Grey, Autumn Tan, Summer Green and Twilight Grey, contrasting colored doors.



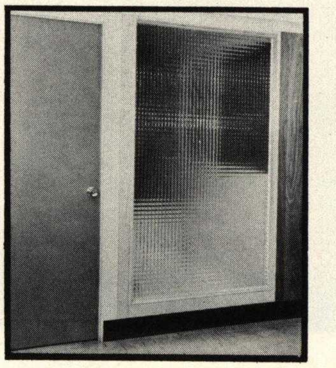
BUDGEX— Panels 2¾″ Thick

Initial cost is less than plaster walls. 100% salvageable. Attractive low-bake enamel ⅛″ tempered presdwood. Presents smooth functional wall. Choice of 6 standard surface colors. Contrasting colored doors.



EXECUTIVE— Panels 3″ Thick

Rich, natural grained wood surface for most exacting requirements of executive offices. Priced low enough to be used in general offices. In natural Birch, Candera, Oak and Walnut or in Birch with a Walnut, Mahogany, Cherry or Fruitwood finish.



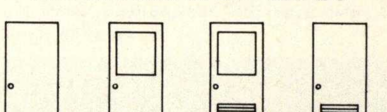
FULL GLASS

Full glass panels are available to harmonize with any of the other GR Richland panels.
In standard panels of 7′2″ to 10′ heights. Widths 2′, 3′, 3′-6″ and 4′. Choice of wide variety of decorative glasses. Glass of 3/16″ thickness or heavier recommended.

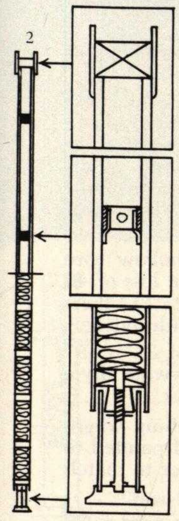
A Plastex Surface is also available. These partitions have plastic surfaces consisting of any wood grain in Marlite patterns.

DOORS

6′8″ High, 3′ Wide
Also Available in 2′6″ and 2′8″



PARTITION-PILASTER HOOK UP...SIMPLE, SURE



CAP

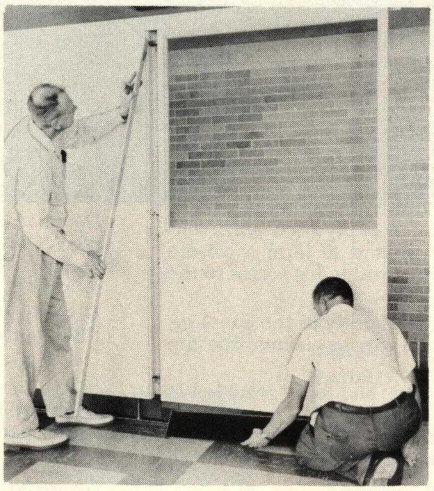
Wire raceway provided in 'H' shaped cap. Access to hollow pilaster is easily accomplished.

EASY CONNECTION

Pilaster connection is easily made. Partitions bolt to metal spacer. Pilaster-faces clip on, presenting a flush pilaster-wall front, readily accessible for inspection or wiring.

BASE

Threaded metal legs raise or lower partition to compensate for uneven floors. Legs rest firmly in floor plate. Presdwood base lifts into partition recess and drops into floor plate.



2″ square metal connector is fastened by hex bolts to partition. Connector holds pilaster face in place by clips.

GENERAL SPECIFICATIONS "R" SERIES RICHLAND WALLS

General: Contractor shall furnish ("and install complete", if desired), "R" Series Richland Walls (____________) type. (Architect: Indicate glazed or solid sections or a combination of both), as manufactured by GR Products, Inc., Grand Rapids, Michigan. Walls shall be in heights. (Architect: Specify height. 8′, 7′-2″, 68″ and 42″.) (Special heights to 10′ available.)

Construction: Walls shall be assembled from panels joined with panel connectors which will receive a flush pilaster to form a post between panels. Walls shall be completely flush across the face. Panel units to be manufactured in 2′, 3′, 3′-6″ and 4′ lengths with special fillers as required. All measurements to be made to centerline of post. Construction shall be such that any panel unit may be removed and replaced without disturbing adjacent panels.

Pilasters: Pilasters shall be ⅜″ plastic faced plywood with concealed clips to snap to panel connectors and to form a closure between panels. Pilaster to be readily removable for access to the wireway thus created.

Crown: Crown shall be "H" type to give rigidity to the panel installation. Crown to provide continuous wireway across the top of the partition, and to receive top filler.

Base: Continuous base to be recessed type, and to be provided in nominal 4 ft. lengths. Base shall fit in continuous groove, top and bottom, and be constructed in such a manner that base sections can be removed and re-installed without use of tools. Base shall lock pilaster in place.

Floor Plate: Floor Plate to require no scribing but to follow contour of floor.

Leveling Devices: Panels shall be equipped with leveling devices which shall allow up to ¾″ adjustment to compensate for uneven floors without shimming.

Solid Type Panels: This type shall have solid panels to full height except for base and crown.

Glazed Panels: Glazed type sections shall have solid panels extending from the top of the base to a point (42″ or 54″) above floor. The glass shall extend from the sill line to 6′-10″ with solid panel above in 7′-2″ or higher and to 68″ in bankrail. Walls shall be furnished with (____________) glass, (Architect: Indicate Blue Ridge Glass Corporation Industrex obscure glass or DSB full strength window glass.)

Doors: Doors to be 1⅜″ thick flush, 3′-0″ x 6′-8″ hollow core type. (68″ in bankrail). Doors to have a transmission loss of 40 decibles at 1,000 cycles, or better. (Architect: Indicate (1) flush solid, (2) with lite, (3) with lite and louver, (4) with louver.)

Door Hardware: Doors to be hung with one pair of 3½″ x 3½″ FBT butts. Doors to be prehung with Yale Brandywine Style (____________) sets. (Architect: Indicate latch or lock.)

Fillers to Ceiling: (Specify fillers from crown to ceiling where desired.) Double mineral board, taped, spackled and painted to match partition or GR Products Richland ceiling filler to match walls.

Electrical Wiring: Walls shall have 2″ x 2″ or better wire raceway between panels and continuous 2″ x 4″ lay-in wire raceway in base.

TYPE SPECIFICATIONS

(In addition to the general specifications, Architects should add one of the following paragraphs after determining the type of surface desired.)

BUDGEX TYPE Walls shall have a smooth flush surface, without exposed metal channels, fasteners or bracing. They shall be 2¾″ thick with ⅛″ hardboard surfaces, tempered both sides, and with 1¼″ fiberglas batt packing. Surface sheets shall be mounted flush on rigid frame of straight grained hemlock, kiln dried lumber, 1¼″ x 2½″. Panels shall have a transmission loss of 42 decibels at 1,000 cycles, or better. Panels shall have interior horizontal bracing at 12″ intervals, or less. Panel and door units shall be interchangeable with units of the same size or with GR Soundex and Plastex units of the same size.

Finish: Exposed surfaces shall be sprayed one coat of high solids sealer, sanded smooth and then sprayed two coats of scuff-resistant, low-bake enamel. Finish to be semi-flat. Color to be GR Products, Inc. standard (____________). (Architect: Indicate number from color card.)

SOUNDEX TYPE Walls shall have a smooth flush surface, without exposed metal channels, fasteners or bracing. They shall be 2¾″ thick and have a sound panel with acoustical core consisting of 1¼″ fiberglas layers on each side of a ⅝″ Firestop Bestwall mineral board sound transmission barrier. Core to have a noise reduction coefficient of .75 or better and a transmission loss of 40 decibels at 1,000 cycles, or better. Surface to be ⅛″ perforated hardboard, tempered both sides. Perforations shall be 3/32″ round holes on 17/64″ centers diagonal. Hardboard shall be laminated to rigid frame of straight grain hemlock, kiln dried lumber, 1¼″ x 2½″. Panels shall have interior horizontal bracing at 12″ intervals, or less. Panel and door units shall be interchangeable with units of the same size or with GR Budgex and Plastex type units of the same size.

Finish: Exposed surfaces shall be sprayed one coat of high solids sealer, sanded smooth and then sprayed two coats of scuff-resistant, low-bake enamel. Finish to be semi-flat. Color to be GR Products, Inc. standard (____________). (Architect: Indicate number from color card.)

PLASTEX TYPE Walls shall have a smooth flush surface, without exposed metal channels, fasteners or bracing. They shall be 2¾″ thick with ⅛″ Marlite surfaces with 1¼″ fiberglas batt packing. Surface sheets shall be mounted flush on rigid frame of straight grained hemlock, kiln dried lumber, 1¼″ x 2½″. Panels shall have a transmission loss of 42 decibels at 1,000 cycles, or better. Panels shall have interior horizontal bracing at 12″ intervals, or less. Panel and door units shall be interchangeable with units of the same size or with GR Soundex and Budgex units of the same size.

Finish: All surfaces except window frames, doors, door frames and base shall be standard Marlite Wood Panel finish as manufactured by Marsh Wall Products, Inc., Dover, Ohio, No. ______, ____________. (Architect: Indicate Marlite Wood Panel finish desired, giving number and name if possible.) To be finished with factory applied baked-on synthetic resin finish permanently integrated to be base material at a temperature of not less than 275° for a minimum baking period of 25 minutes to completely polymerize the plastic surface. The finish shall be uniformly baked over the entire panel surface.

Window frames, doors, door frames and base shall be in a complimentary enamel finish, with exposed surfaces sprayed one coat of high solids sealer, sanded smooth and then sprayed two coats of scuff-resistant, low-bake enamel.

EXECUTIVE TYPE (Use A in all cases, indicating wood desired. Select B 1, 2, 3, 4, 5, 6, 7, or 8, as desired, and add.)

A.

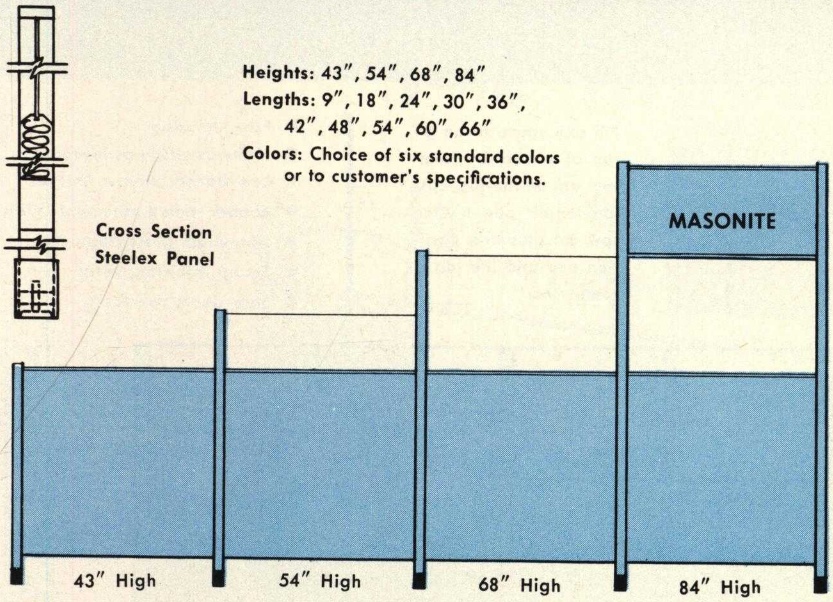
Walls shall have a smooth flush surface without exposed metal channels, fasteners or bracing. They shall be 3″ thick, with 3/16″ natural grained (____________) plywood surfaces. (Architect: Indicate the type of wood desired: Birch, Candera, Walnut or Oak), with 1¼″ fiberglas batt packing. Surface sheets shall be mounted flush on rigid frame of straight grained hemlock, kiln dried lumber, 1¼″ x 2½″. Panels shall have a transmission loss of 42 decibels at 1,000 cycles, or better. Panels shall have interior horizontal bracing at 12″ intervals, or less.

B.

1. *Softone Birch:* Exposed surfaces shall be sprayed one coat of softone toner, sealed with high solids sealer, sanded smooth, then sprayed two coats of clear synthetic enamel.
2. *Walnut Finished Birch:* Exposed surfaces to be stained one even coat of walnut stain, sealed with high solids sealer, sanded smooth, then sprayed two coats of clear synthetic low-bake enamel.
3. *Cherry Finished Birch:* Exposed surfaces to be stained one even coat of cherry stain, sealed with high solids sealer, sanded smooth, then sprayed two coats of clear synthetic low-bake enamel.
4. *Fruitwood Finished Birch:* Exposed surfaces to be stained one even coat of fruitwood stain, sealed with high solids sealer, sanded smooth, then sprayed two coats of clear synthetic low-bake enamel.
5. *Mahogany Finished Birch:* Exposed surfaces to be stained one even coat of mahogany stain, sealed with high solids sealer, sanded smooth, then sprayed two coats of clear synthetic low-bake enamel.
6. *Natural Candera:* Exposed surfaces shall be sprayed with high solids sealer, sanded smooth, then sprayed two coats of clear synthetic low-bake enamel.
7. *Natural Walnut:* Exposed surfaces shall be filled with natural walnut filler, sprayed with high solids sealer, sanded smooth, and then sprayed with two coats of clear synthetic low-bake enamel.
8. *Natural Oak:* Exposed surfaces shall be filled with natural oak filler, sprayed with high solids sealer, sanded smooth, and then sprayed two coats of clear synthetic low-bake enamel.

STEELEX

Here is portable steel partitioning combining utilitarian function with beauty and versatility. Steelex is the only 2″ flush steel partition on the market. It offers greater strength and stability than other partitions yet is economically priced. A unique internal bracing construction is another feature emphasizing Steelex sturdiness and rigidity. A patented spring tension locking device permits runs up to 15 feet without additional floor anchors. Steelex partitions are available in standard heights from 43″ to 84″ in standard modular lengths and in a choice of six colors . . . Sunrise Tan, Spring Green, Morning Grey, Autumn Tan, Summer Green and Twilight Grey. Installation, moving and servicing of Steelex is easy.



Cross Section Steelex Panel

Heights: 43″, 54″, 68″, 84″
Lengths: 9″, 18″, 24″, 30″, 36″, 42″, 48″, 54″, 60″, 66″
Colors: Choice of six standard colors or to customer's specifications.

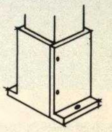
Color — keyed, contrasting stub doors and gates available

GLASS: Clear or obscure, any thickness to ¼″

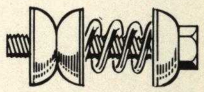
GLASS HEIGHT:	54″ panel — 12″	84″ panel — 24″	68″ panel — 24″
GLASS LENGTH:	9″ — 6⅝″	36″ — 33⅝″	54″ — 51⅝″
	18″ — 15⅝″	42″ — 39⅝″	60″ — 57⅝″
	24″ — 21⅝″	48″ — 45⅝″	66″ — 63⅝″
	30″ — 27⅝″		

STEELEX FEATURES

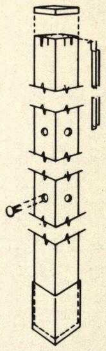
- X-large, rubber footed, adjustable floor glides.
- Aluminum and rubber glass top channel.
- Side glass channel locks fast to partitioning.
- Pressed-fit caps fit snug and tight.
- Post buttons snap in tight, can't come off.
- Stub door available.
- Baked enamel washable surfaces.



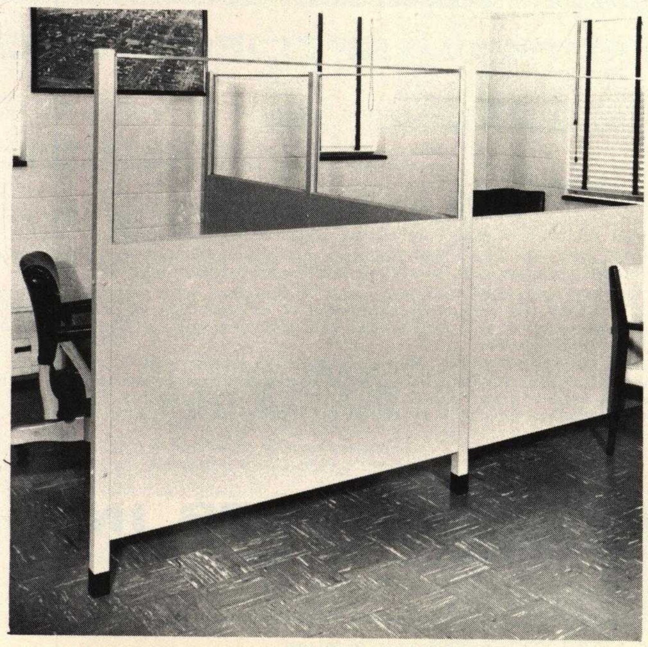
Bracing shoe for long runs insures plumb straight installation.



Patented locking device holds post, provides rigidity. Easy to unlock.



Post showing glass bracket held in place by press-fit cap. Unused holes capped by snap-in buttons.



STEELEX 'M' SERIES PARTITIONS Specifications

Contractor shall furnish and install complete "M" series Steelex partitions in (43″, 54″, 68″ or 84″ as specified) heights as manufactured by GR Products, Inc., Steel Division, 47-01 35th Street, Long Island City, New York.

CONSTRUCTION: Partitions shall be assembled from post and panel units of the same thickness. Panel units to be manufactured in 6″ increments from 18″ to a maximum of 66″ with a 9″ filler panel. Panels and posts shall be so designed as to permit disassembly and reassembly by semi-skilled labor or by shop maintenance personnel. Partition shall have open base 6″ high.

PANELS: Panels shall be constructed of 20 gauge, cold rolled, strecher-leveled sheets with horizontal channel reinforcements spot welded to back face of panel. Panels shall be completely factory assembled and solidly packed with mineral wool. Panel thickness shall be 2″. The lower 3″ of the panel shall contain no insulation to permit the use of concealed wiring.

POSTS: Posts shall be of 18 gauge square steel tubing. All posts shall be prepared to receive interlocking devices on all sides as required. Snap-in buttons shall be provided to fill interlocking provisions not used.

INTERLOCKING DEVICE: Interlocking device between panel and post shall consist of two spring loaded bolts which shall be securely fastened to the post. Assembly shall be accomplished by manual engagement of the interlocking device with the panel without the use of special tools.

LEVELING DEVICE: All posts shall be equipped with a screw type leveling device which will permit adjustment to meet floor irregularities. Leveling devices shall be concealed with 3″ black metal leg cover.

FLOOR ANCHOR: Heavy duty floor anchors shall be provided to be used at all gates and as required elsewhere for rigidity.

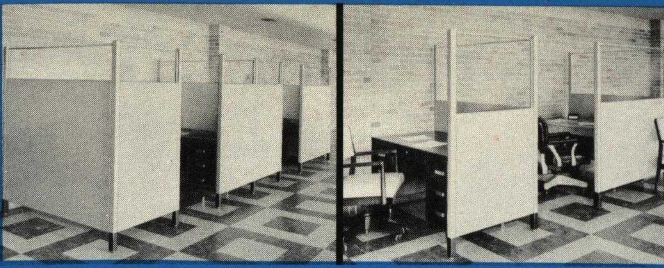
GATES: Gates shall be of same construction as panels reinforced to receive hardware as required. Standard hardware shall consist of 1½ prs. hinges and 1 Schlage A-10-S Latchset.

FINISH: All exposed surfaces shall be thoroughly degreased and dried before painting. First coat shall be a metal primer and second coat shall be baked-on enamel of eggshell texture. Color to be selected from GR Products standard color chart.

GLASS: Glass shall be of the highest quality specified. Glass shall be held firmly in place through the use of plastic glazing moulding without the use of putty.

SOUNDEX

Partitions — for noise control

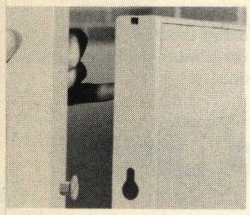


BUDGEX

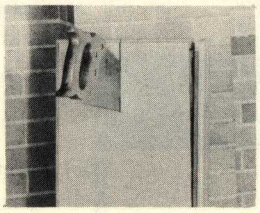
Partitions — for economy

Perforated presdwood surface for noise control. Economical Soundex partitions sound absorbing qualities help increase employee efficiency as well as raise employee morale. The Soundex partitions have a perforated, sound catching surface backed by acoustical spun glass and a sound retarding "floating" core. Partitions are 2″ thick, joined together with a positive locking device to form a flush surface. Available in four styles, 42″ to 68″ in modular lengths and six standard colors.

Budgex offers effective, low cost partitioning adaptable to any company budget. They are filled with spun glass and offer some measure of acoustical control. Budgex partitions also form a flush surface when joined with a positive locking device and are available in four styles, 42″ to 68″ in modular lengths and six standard colors. Partitions are 2″ thick.

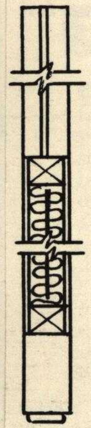


Patented locking device is simple, easy to use. Locks fast, holds securely, easy to disassemble.

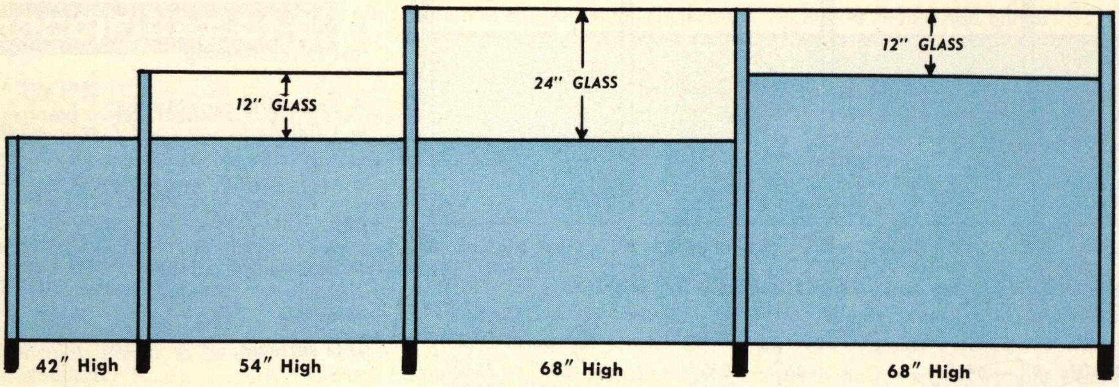


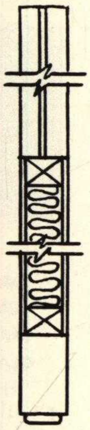
Fill any space in an off run of panels by forming an on-the-job custom-length panel. One saw cut plus one partition end and the job is completed.

- Free standing
- Move as easily as furniture
- Low-baked enamel finishes
- Rubber footed adjustable glides
- Aluminum glass channels
- Sound retarding cores
- Stub doors available



Cross Section Soundex Panel





Cross Section Budgex Panel

Glass: Clear or obscure to ¼″ thickness

Partition ends, gates, stub doors, chalk boards, peg boards, cork boards.

SOUNDEX • BUDGEX "K" SERIES PARTITIONS • • SPECIFICATIONS

GENERAL: This contractor shall furnish and install complete "K" Series__________ Partitions,__________type. (Architect: Indicate "Soundex" or "Budgex", also (1) 42″ flush type, (2) 54″ type with panel to 42″ and 12″ of glass above, (3) 68″ type with panel to 42″ and 24″ glass above, or (4) 68″ type with panel of 54″ and 12″ glass above.) Glazed type shall have aluminum channel at top and sides and plastic molding at top and bottom of glass. Partitions shall be in 2′, 3′, 4′, 5′ and 5½′ lengths, all as manufactured by GR Products, Inc., 2417 Eastern Avenue, S.E., Grand Rapids 7, Michigan.

CONSTRUCTION: (Architect: Select construction desired, (A) or (B).

(A) SOUNDEX TYPE: Panels and posts shall be 2″ thick. Panels to have ⅛″ perforated hardboard surfaces, tempered both sides, laminated flush on hardwood frames. Interiors to have internal bracing and to be fiberglas packed. Perforations shall be 3/32″ round holes on 17/64″ centers diagonal. Panels shall have a sound absorbing core consisting of ¾″ fiberglas batts surrounding built-up fibrous baffle floated in the fiberglas. Core to have a noise reduction factor of .85 or better. Post to be select hardwood.

(B) BUDGEX TYPE: Panels and post shall be 2″ thick. Panels to have ⅛″ hardboard surfaces, tempered both sides, laminated flush on hardwood frames. Interiors to have internal bracing and to be fiberglas packed. Posts to be select hardwood.

PANEL FINISHES: All surfaces shall be sprayed one coat of high solids sealer, sanded smooth and then sprayed two coats of low-bake lacquer enamel. Finish to be GR Products standard __________, No.__________.

POST FINISHES: Finish to be GR Products standard __________, No. __________, with surfaces to be sprayed one coat of high solids sealer, sanded smooth and then sprayed two coats of low-bake lacquer enamel.

INTERLOCKING DEVICES: Partitions and accessories shall be equipped with interlocking devices such as will permit simple but firm attachment.

LEVELING DEVICES: All posts shall be equipped with screw type leveling devices which will permit an adjustment of at least 1½″, or with adjustable metal shoe such as will permit rigid floor fastening, with leveling devices and shoes interchangeable.

GLASS SPECIFICATIONS: Partitions shall be furnished with (__________) glass. (Architect: Indicate Industrex or Factrolite obscure glass or DSB double strength window glass.) Other glass up to 7/32″ thickness may be specified. Specify whether glass shall be provided by bidder or by separate contract.

a custom designed partition

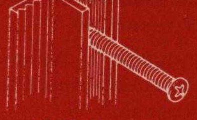
at a stock price . . . .

with your selection of any 1⁹⁄₁₆" paneling

and H & B standard aluminum sections

1960

AIA File 35-H-6



Patented

The SECRET of H & B Movable Partitions is the continuous threaded channel which allows the bolt to be threaded in at any location along the entire strip.

distributed by:

H & B ENTERPRISE CORPORATION

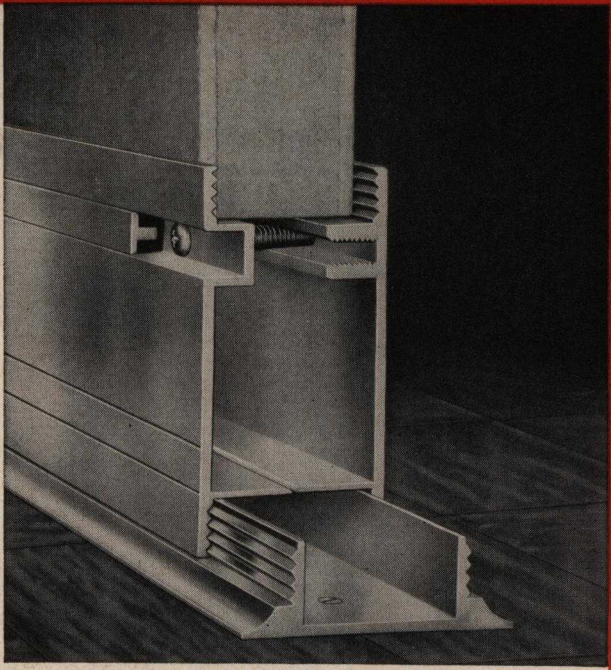
1150 SOUTHARD STREET · TRENTON 8, N. J. EXport 6-3516

*H & B

. . . the movable partition *you* design

- standardized extruded aluminum framing sections of 6063-T5 alloy, natural or anodized (satin) finish
- with your own selection of any 1-9/16″ paneling
- assembled like an "Erector" set
- with a minimum number of bolts
- through the interlocking aluminum components

result: a solid, sound resistant partition . . . movable as the need arises



the key to H & B design
the continuous ribbed channel and the interlocking aluminum sections

Patented

the *advantages* to YOU of the H & B aluminum partition

select your own paneling—and decorate it as you wish

With the H & B aluminum partition a designer is no longer handicapped by stock designs, stock sized panels or specified colors and finishes. Now he is free to choose from a number of preformed 1-9/16″ thick wall panels manufactured by leading companies throughout the country. He may select exactly the type of panel his installation requires . . . for sound resistance, for texture, for material, for cost. Then the selected paneling may be finished in any way most suitable to the office or other location. The manufacturers listed below are some of those recommending H & B sections with their 1-9/16″ panels for custom design and economical job-site fabrication.

Porcelain Enamel Panel • Atlas Enameling Co., Inc., 2020 N. Broadway, St. Louis, Mo.
Cemesto Panel • Celotex Corp., 120 S. LaSalle St., Chicago 3, Ill.
Plastic Faced Panel • Clad Rex Steel Co., 2101 Indiana Ave., Chicago 16, Ill.
Plywood Panel • General Plywood Corp., P.O. Box 1403, Louisville 1, Ky.
Transitop Panel • Johns-Manville Sales Corp., 22 E. 40th Street, New York 16, N.Y.
Insulpanel • Keasbey & Mattison Co., Ambler, Pennsylvania
Fiberglas Panel • Keller Products, Inc., 41 Union St., Manchester, N. H.
Asbestone Panel • National Gypsum Co., 325 Delaware Ave., Buffalo 2, N. Y.
Thermo-Bord Panel • Philip Carey Manufacturing Co., Lockland, Cincinnati 15, Ohio

available in most large cities

The companies listed below, as well as other manufacturers of panels suitable for H & B aluminum partitions have nation-wide distribution and panel stocks are available in most large cities. Any of these local distributors who assemble and deliver the complete partition will be glad to furnish you with information and wall panel details and cooperate in any way possible. Prompt service and delivery from local supplies speed partition installation. H & B has distributors throughout U.S. which handle our parts and the various panels.

economy in erection is assured

- simplicity of design and a minimum number of parts meet every condition and facilitate assembly.
- no specially trained crews are required. Your own men can erect the H & B partition or make immediate changes in layout without extra expense.
- no special layouts are needed. Field installation can proceed directly from architectural plans or rough sketches.
- panels and aluminum framing sections permit field sawing of parts without difficulty or delay. Except for door jambs, which are mitered at factory, all sections require only straight cuts.
- no special tools or equipment are required for original installation or subsequent revisions in layout. All that is needed is ¼″ Drill - Hacksaw - File.

other advantages of H & B aluminum partitions

saves valuable floor space

a partition only 1-9/16" thick saves hundreds of square feet of floor space compared with conventional types of partitions.

appearance

clean-cut and functional are the words describing the H & B aluminum partition. The beautiful natural or satin finish of aluminum may be featured by any panel color or finish you desire.

salvageable for re-erection

the threaded channel and interlocking sections permit easy removal of all bolts and the complete salvageability of all parts for use over and over again as space requirements change. A number of companies have used the same components for many years.

soundproofness and insulation

wall panels may be selected for their soundproofing and insulating value. The paneling manufacturers listed on page 2 state that these characteristics of their panels are equal to any on the market today. YOU choose the one best meeting your own conditions.

complete freedom of design

the H & B aluminum partition is made to your own plans and to meet your own special requirements. Stock materials, sizes, finishes no longer dictate your partition installation. Lay out your partitions as YOU want them.

wiring is simple

the large aluminum battens (shown opposite) accommodate wiring vertically or horizontally and standard full-size base or wall outlets may be located where required.

the manufacturer

the H & B Enterprise Corporation has been producing a wide range of products for the construction industry for 10 years. The Company's long experience in this field, highly trained engineering staff and completely modern manufacturing facilities guarantee the design, the quality and the durability of this unusual partition system.

short form specifications

Partitions shall be as manufactured by the H & B Enterprise Corporation, 1150 Southard St., Trenton N. J.

Architectural floor plans shall be used in conjunction with H & B standard details. Shop drawings shall not be required.

$1\frac{9}{16}$" panels as specified by the architect shall be used with H & B 6063-T 5 aluminum extrusions for Base, Cap, Battens, Door Jamb and Head Mouldings and Intersecting Channels. All extrusions and mouldings to be H & B Standard, designed structurally of required strength and thickness up to .125". Battens and Corners will have Threaded Coupling for easy erection and re-erection. Insulated panels of required decibel sound proofness and insulation characteristics to meet requirements specified by the architect.

All partition component parts shall be interchangeable and salvageable for economical re-erection. All aluminum framing and moulding members shall have straight cuts made without use of special tools. Door Jamb and Head Mouldings shall be mitered at factory. H & B simplified system does not require specially trained crews for erection.

All joints shall be straight and tight. Horizontal lines shall be level and all walls straight and plumb. Finished surfaces shall be thoroughly cleaned and left free of imperfections.

(Doors, door hardware, painting and glass to be furnished by others)

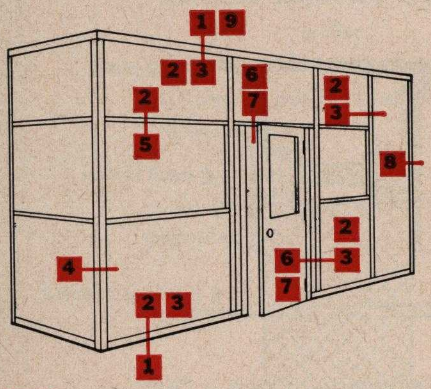
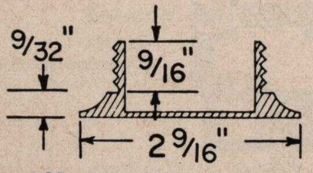
VERTICAL SECTION—½ FULL SIZE

basic components

scale ½ full size



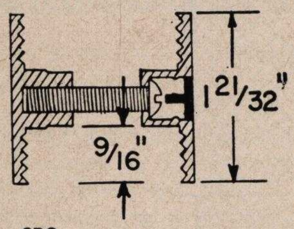
1 base or cap plate



no. BC1

Base or cap plate fits both small and large battens, for all partition bases, and caps for free standing or full height partitions.
Lengths: 12′

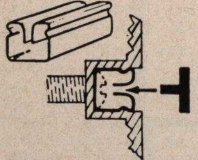
2 small batten



no. SB2

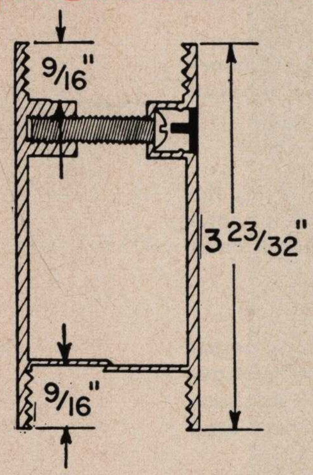
For use at joints where no wiring is required. Joints in sheets to be ⅝″ to allow for batten, and batten bolts approximately 12″ O.C. Available in 8′, 10′, 12′ lengths.

▲ snap-in "T"



Small clips inserted between bolt heads approximately 1′-6″ on center. "T" and clips are furnished with small and large aluminum battens.

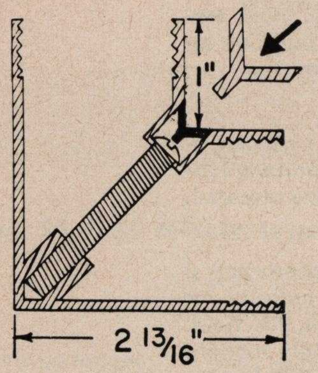
3 large batten



no. LB3

For use wherever wiring is required, to conceal wiring and retain outlet boxes. Bolts in battens are approximately 12″ on center. Lengths: 8′, 10′, 12′

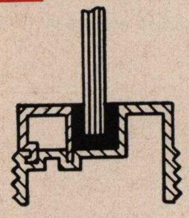
4 corner batten



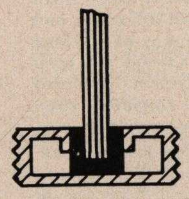
no. CB4

Bolts in batten are approx. 12″ O.C. Small clips inserted between bolt heads approx. 1′ O.C. (comes furnished with "Y" and clips.)
Lengths: 8′-6″, 10′-6″, 12′-6″

5 window spacer



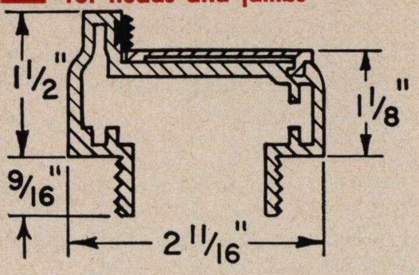
no. WS5



no. RWS5

For use in either large or small batten to frame for glass.
Lengths 6′, 7′, 8′
3/16″ or ¼″ glass—be sure to state glass size

6 door moulding for heads and jambs

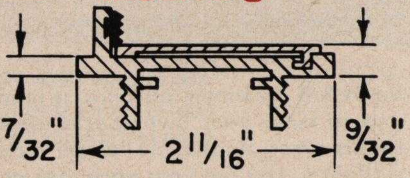


no. DJ6

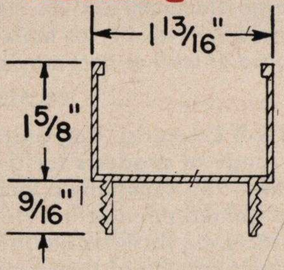
Comes in two sizes: one for doors 1 ⅜″ thick and the other size for doors 1 ¾″ or 2″ thick. Overall dimensions are the same for both types of moulding. Door heads mitred in our factory.
Be sure to state door size.
no. **DJ6** for door heads

7 standard door moulding

no. SDJ7



8 intersecting moulding



no. IM8

For use where partition intersects another wall.
Lengths: 10′, 12′

9 flat intersecting channel

no. FIC9

Can be used in place of cap plate. Is used in rail type partition.

Specific detailed literature is available for any Hauserman wall system on request. See address and telephone listing on back cover . . . or write direct:

THE E. F. HAUSERMAN CO., 7592 GRANT AVE., CLEVELAND 5, OHIO

THE E. F. HAUSERMAN COMPANY

Half a century of precision prefabrication is the background behind the design of the newest Hauserman movable walls—Signature.

Beginning in the infancy of the mass production movement, Hauserman pioneered the idea of furnishing building materials at the construction site, on an installed complete basis. This, combined with a unique policy of nationwide service, the creation of new designs in wall systems, and a reputation for quality and service, has established The E. F. Hauserman Company as the leader in the partition industry.

As the world's largest manufacturer of movable interior walls, Hauserman has the design and production facilities, the skilled craftsmen, the assembly line know-how, to offer you the very latest in proven movable wall designs and the economies of prefabrication. Extensive plant capacity and mechanization of operations, assures you fast, accurate and efficient service.

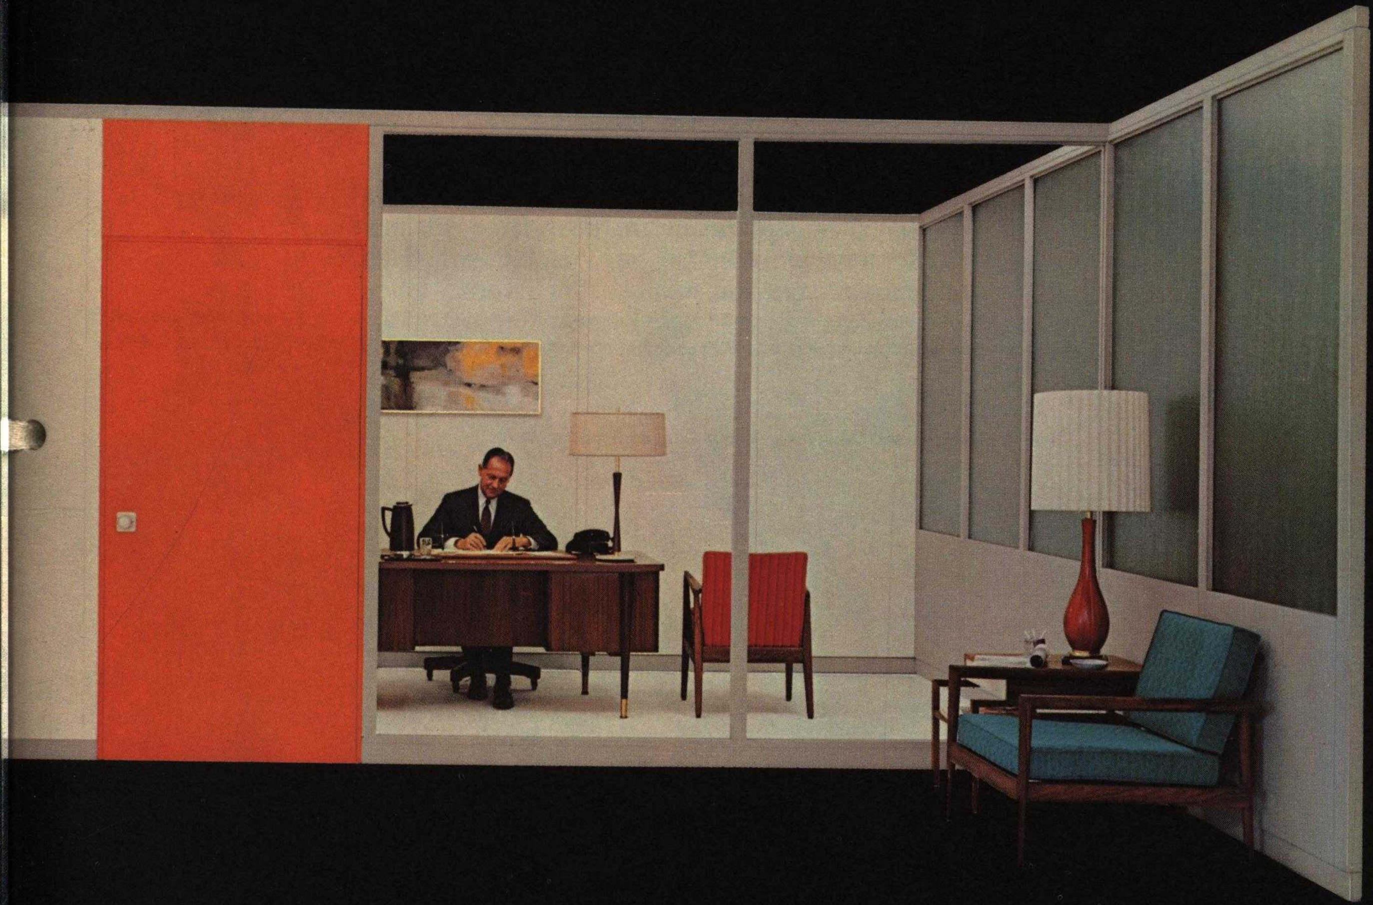
signature

by Hauserman



Signature . . . by Hauserman . . . tailors space to your needs with crisp, modern lines; offers universal application and function in both new and old buildings.

Signature has the slimness required for proper proportion. It offers the slimness that good architecture requires. Signature panels and posts are only 2¼″ thick with all of the benefits inherent in more cumbersome wall systems, plus new advantages in flexibility, application and appearance.

Simplicity characterizes Signature. It is designed and engineered to achieve strength without bulk, precision without complication, and beauty without sacrifice of function.

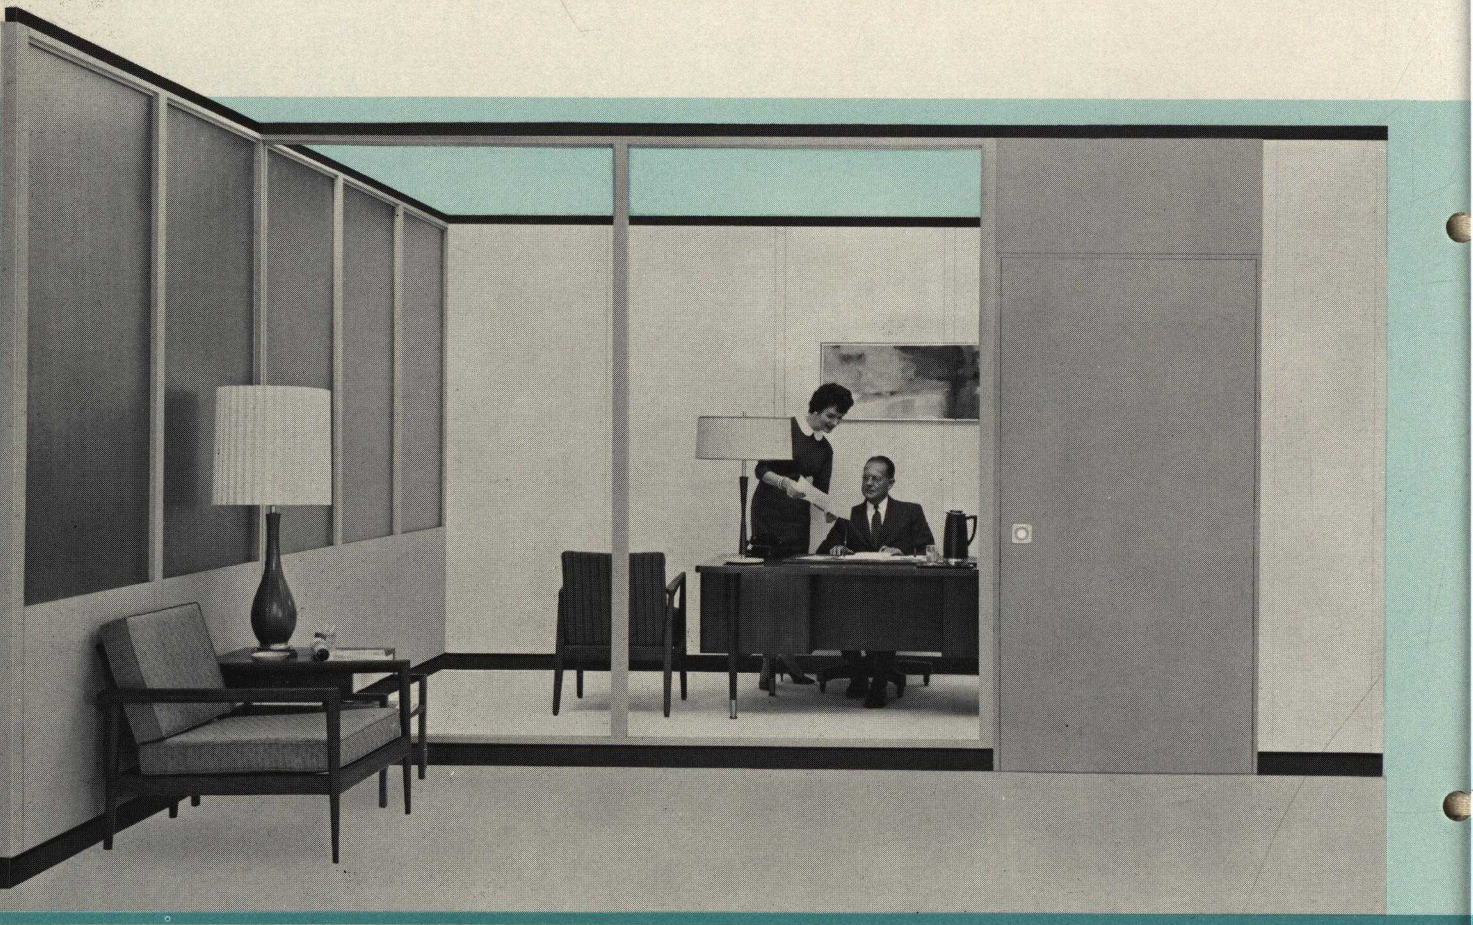
Trim posts, strikingly simple door units, interchangeable components and slim panels all contribute to the total result: Signature is an ideal solution to the space division needs in commercial and industrial buildings.

Signature makes it practical to carry out the desire of the architect and the designer for personal design expression and the demand of the building owners and tenants for the completely practical. A wide variety of design effects are possible through the use of borrowed light, clear and obscure glass patterns, natural woods, the textures of natural and synthetic wall coverings, and the colors of painted steel panels. The inherent flexibility of the Signature system makes changes in the office layout possible at any time—whether the alteration has to be made in a building under construction or in an occupied building where the layout has grown obsolete. Take-down and re-erection of panels is quick and easy and all components are completely reusable.

Because Signature has been designed as a complete system and is mass prefabricated, its basic values are much greater than those of other wall systems.

BASIC VALUES...

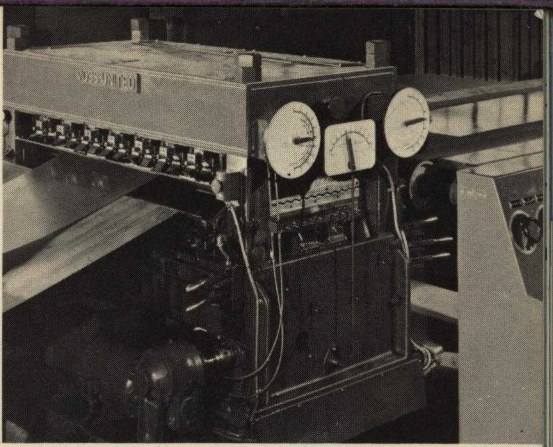
ATTRACTIVE APPEARANCE

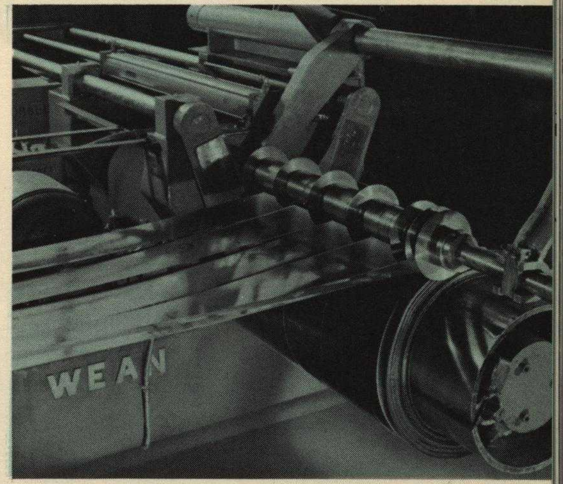


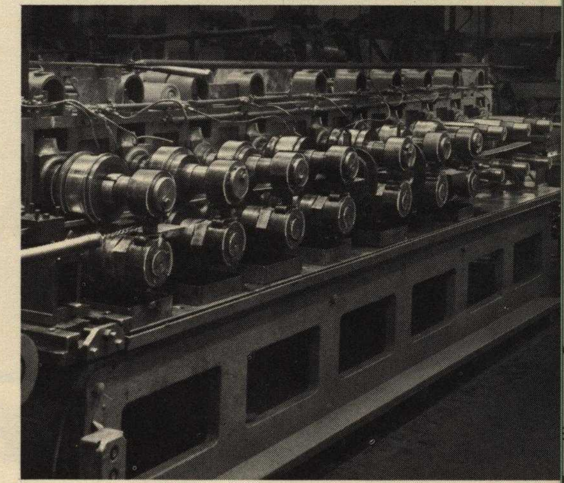
The proportionate slimness of Signature subordinates its presence in the interior decor, making it the supporting background for furnishings and human activity. Every detail, including slim new door units, has been refined to contribute to an overall effect of graceful privacy and efficient traffic flow. Glass, framed by trim posts between lites of obscure or polished plate, woods, fabrics and colors, are all elements which can contribute to a design which will be appropriate to any particular task area.

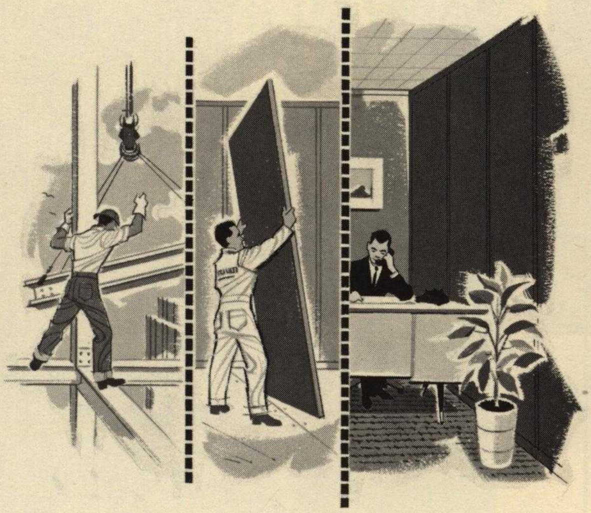
PRECISE PREFABRICATION

The skill and experience of Hauserman craftsmen, the most mechanized production facilities in the industry, an extensive system of quality control, all result in an end product that is always made to close tolerances. The designer can be confident that his layouts will be executed exactly; the building owner can be sure of consistent quality that provides the long-term advantages he bargained for.









EARLIER OCCUPANCY

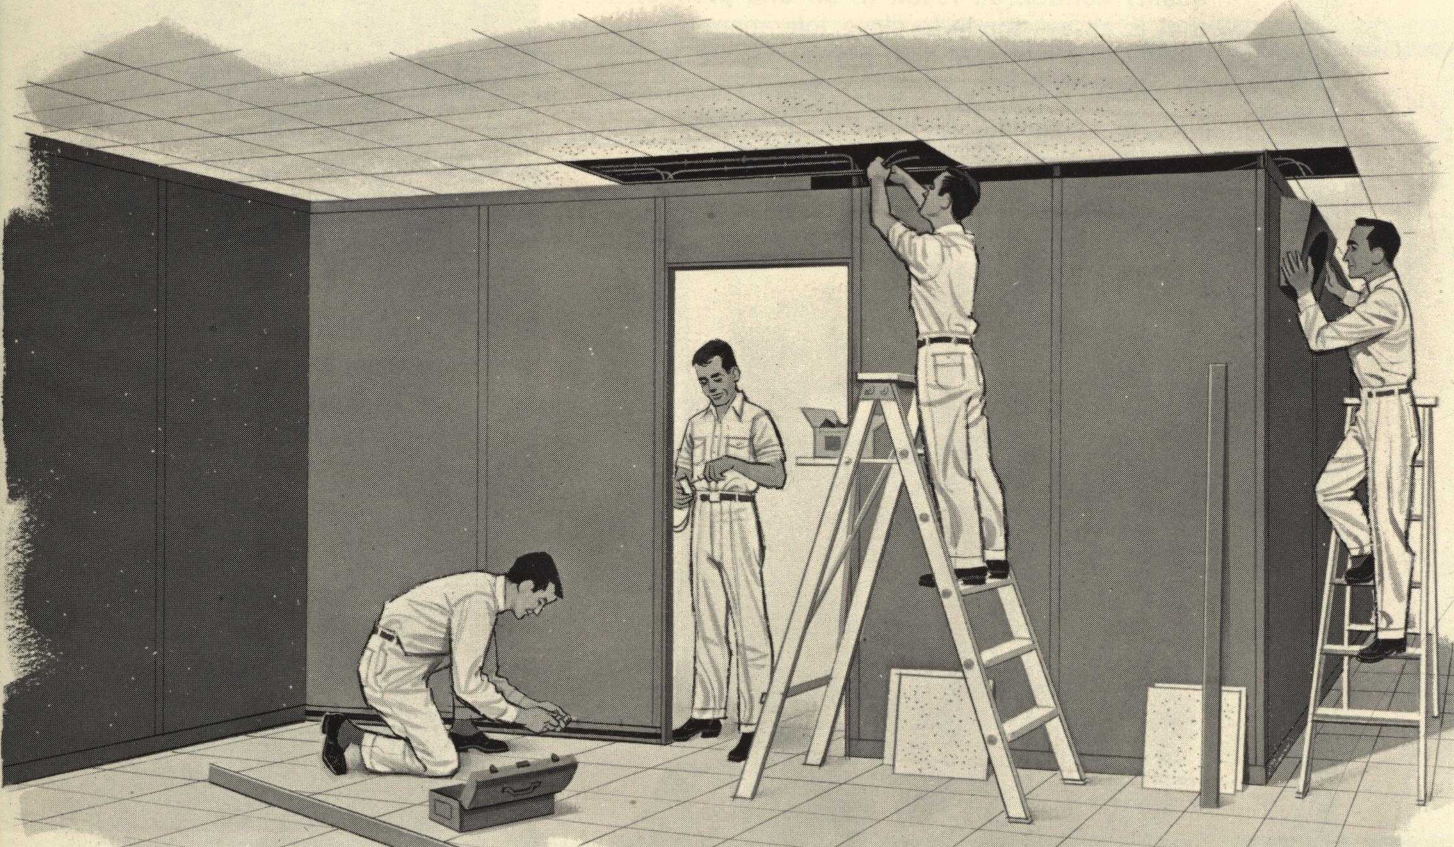
Because Signature is prefabricated, it eliminates the need for on-site construction of interior walls. This means earlier occupancy and an earlier return on the building investment. It's quicker, easier and less expensive to renovate occupied quarters when this Hauserman movable wall system is installed. Precisely engineered components and trained erection crews cut delays to an absolute minimum. Later changes, to adapt space to new needs, can be accomplished simply and inexpensively by relocating standard Signature units.

signature

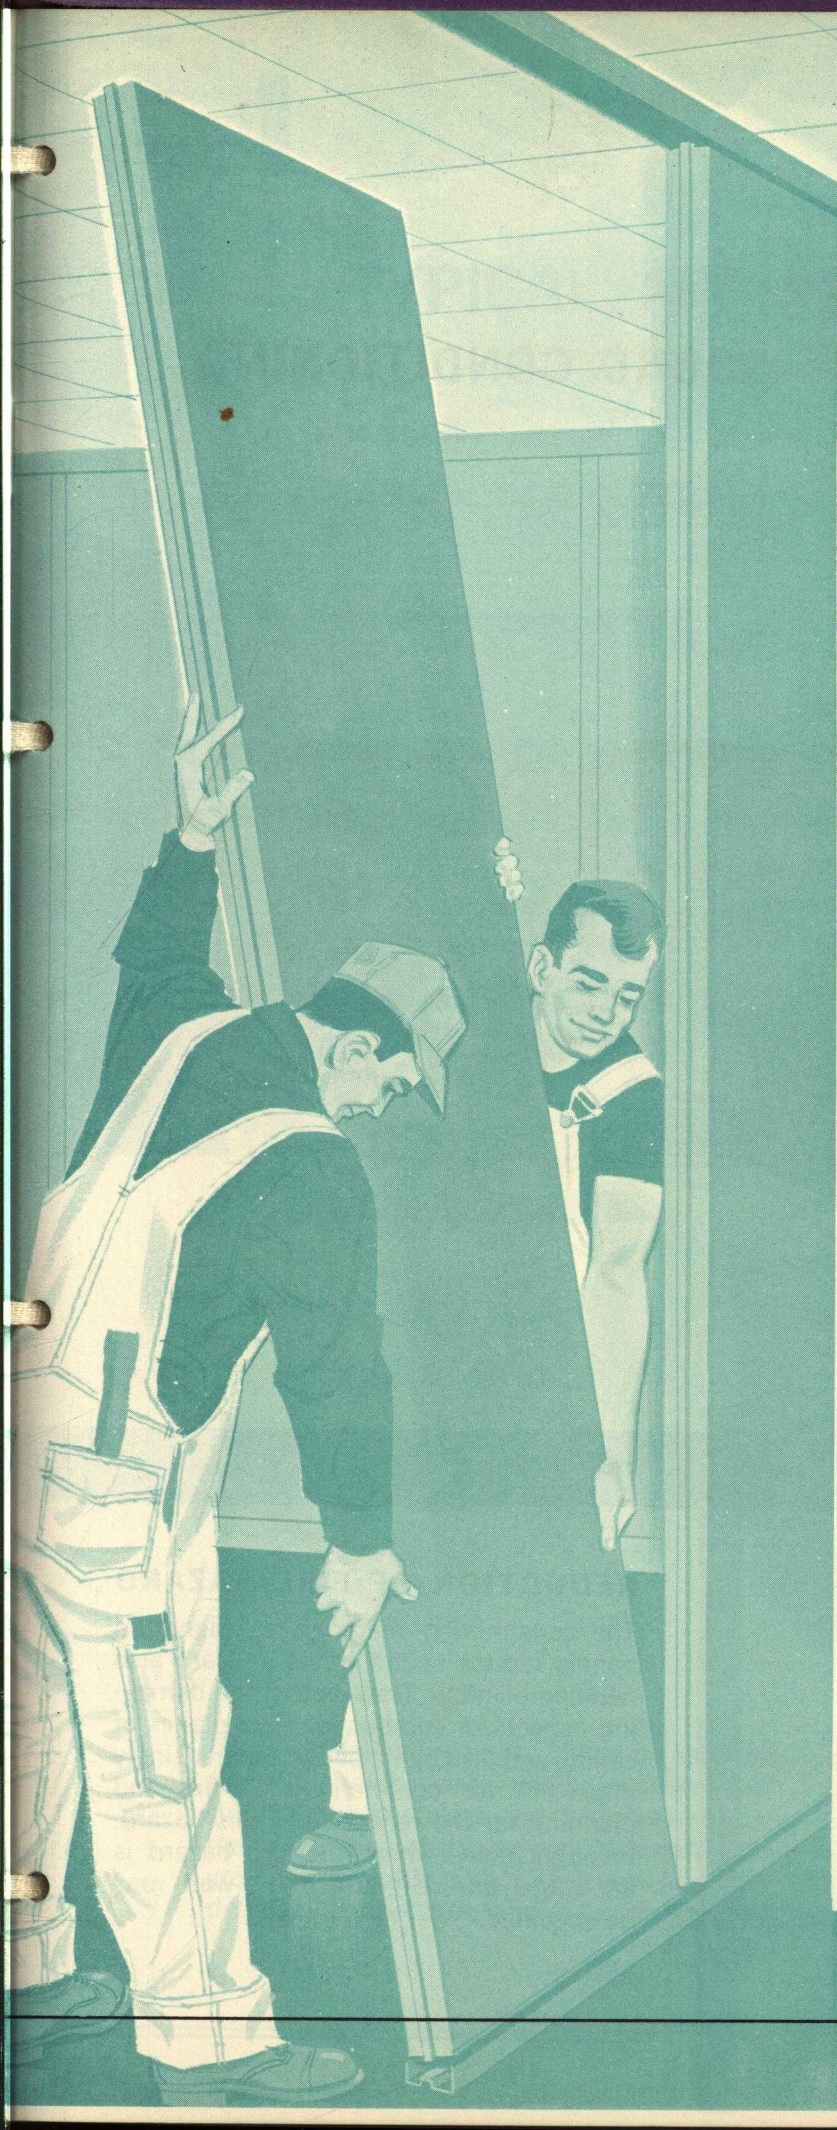
by Hauserman

BASIC VALUES...

EASY ACCESS . . . WIRING AND UTILITIES

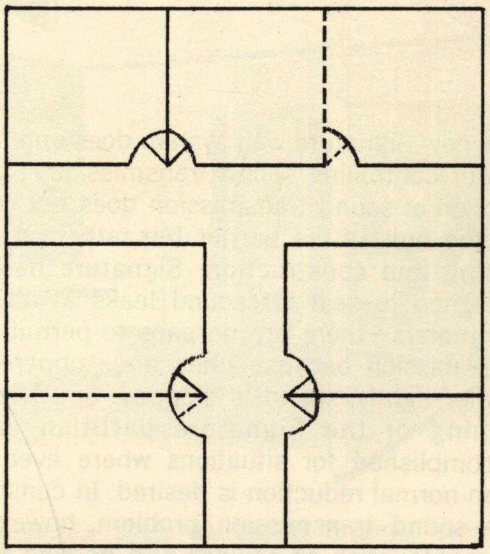


In the new Signature wall system flexibility means more than the ability to relocate panels. It is designed for quick, easy access to wiring and utilities — an important factor when changes must be made in the location of utilities, business machines and telephones. Permanent-appearing elements of this wall system can be removed simply, the desired changes made, and the elements replaced or changed.

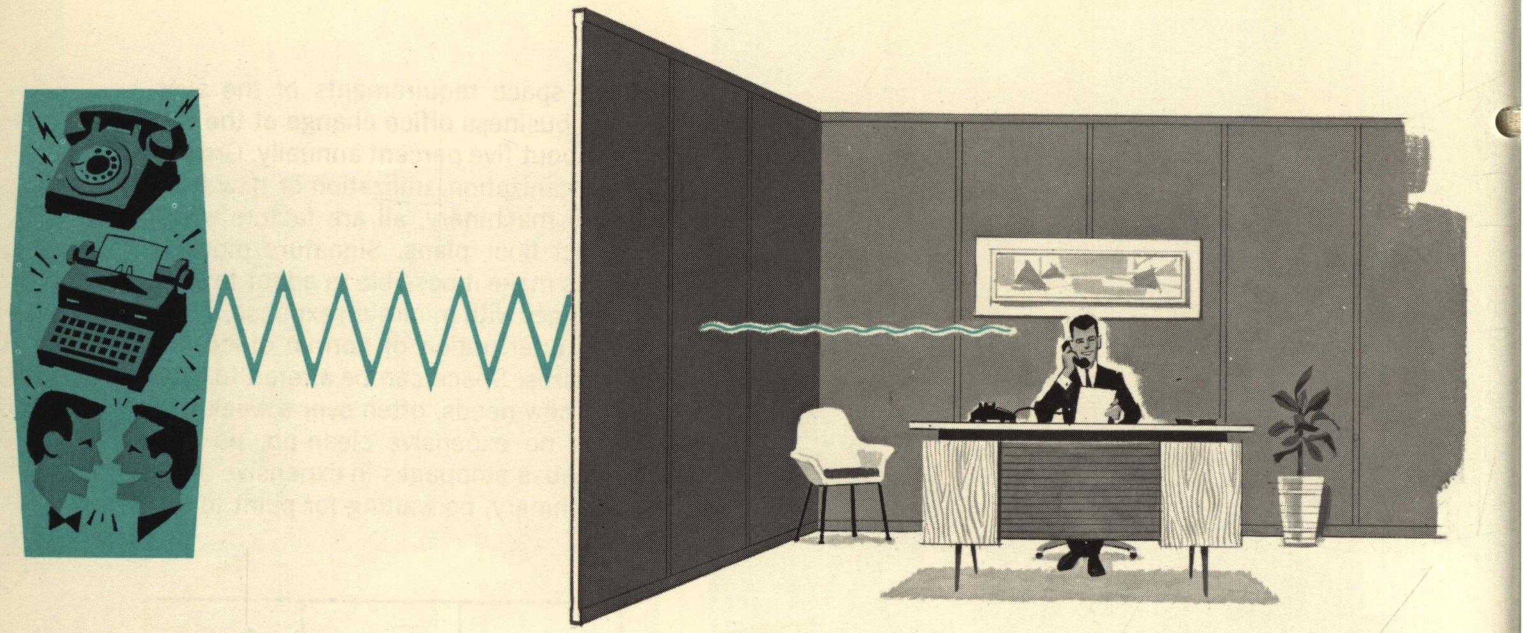


ENGINEERED MOVABILITY

The space requirements of the average business office change at the rate of about five percent annually. Growth, reorganization, utilization of new business machinery, all are factors which affect floor plans. Signature movable walls make it possible to adapt to such changes with minimum expense, delay, and interruption of normal office procedures. Space can be altered to meet the new needs, often over a week-end, with no expensive clean-up, no dust to cause stoppages in expensive office machinery, no waiting for paint to dry.



BASIC VALUES...
SOUND CONDITIONING

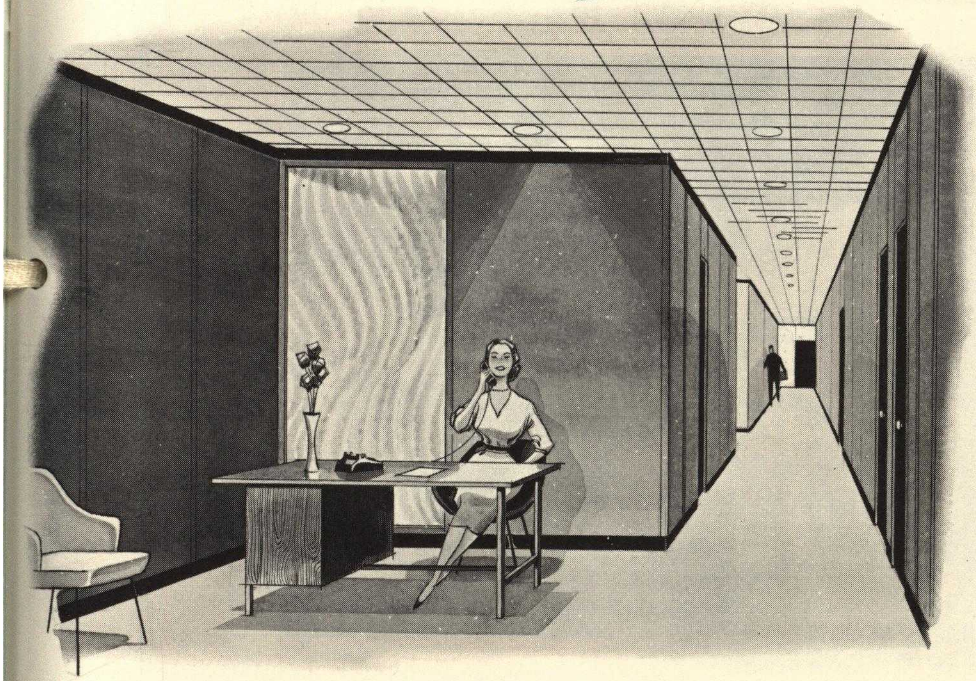


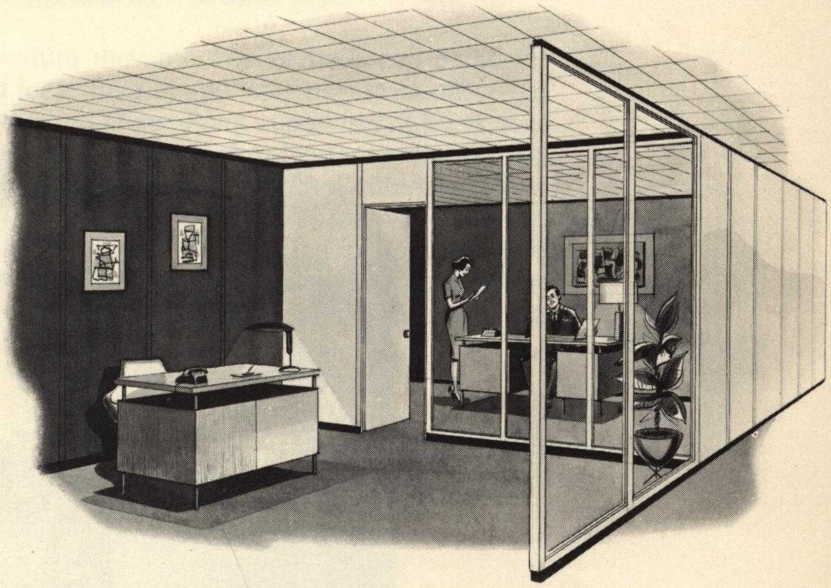
The new Signature wall system does an efficient job of controlling sound transmission. The prevention of sound transmission does not depend on the bulk of the barrier, but rather on its detailing and construction. Signature has been designed to seal off sound leaks at all of its perimeters—there are no gaps to permit sound transmission because units are "zippered" together tightly, sound is stopped. Special conditioning of the Signature partition can be accomplished for situations where even more than normal reduction is desired. In considering the sound transmission problem, however, all elements, such as ceilings and heating and air condition ducts must be considered and dealt with in the planning.

REDUCTION OF FIRE HAZARD

The construction materials in Signature panels reduce sound travel and are also non-combustible. They restrict the damaging aspects of combustion. The planes of ceiling and floor again become increasingly important for confinement of fire and planning for the reduction of this hazard. In applications where the fire hazard is an acute one, Signature fire-wall may be specified.

TYPICAL APPLICATIONS
IN OFFICES

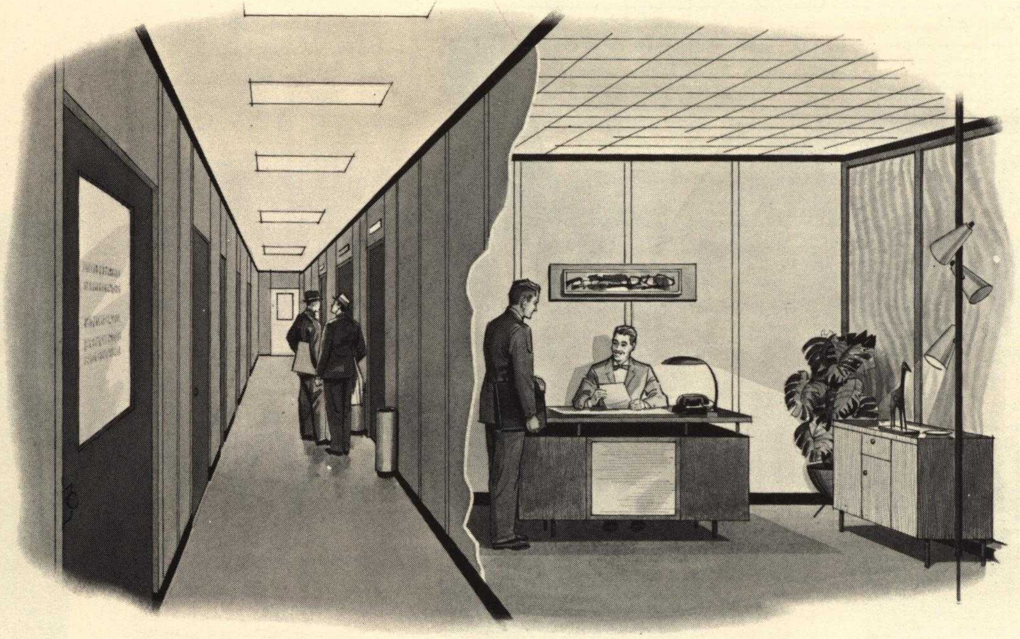


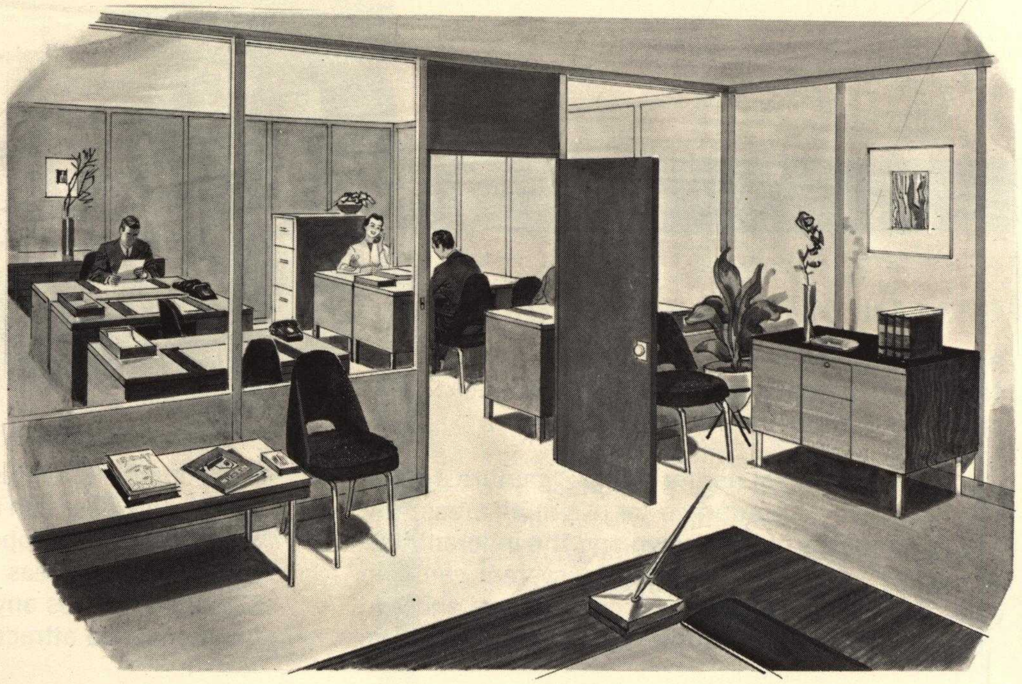


The universal nature of the Signature system makes it appropriate for use in all areas. The simplicity of the design and the inherent aesthetic qualities of this new system can help create a favorable corporate image and add prestige in executive and reception areas.

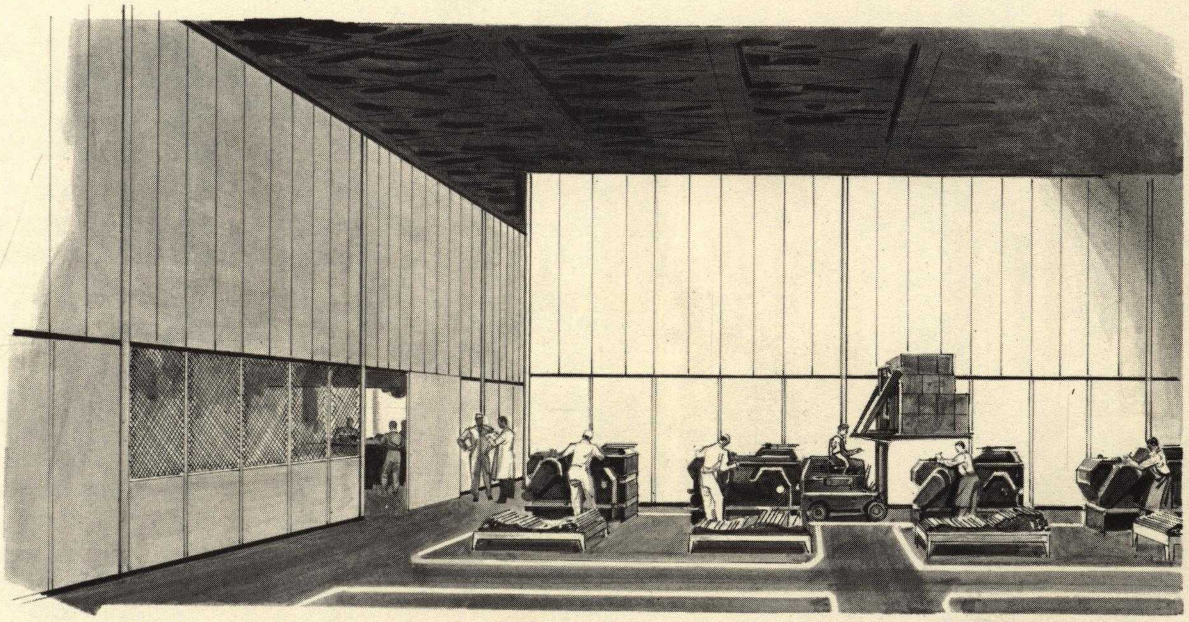
Components such as baked enamel steel panels and glass can be combined to provide visual control in supervisory areas and privacy in other areas where it is desirable. Signature defines any area precisely and is a functional and attractive way to divide space.

TYPICAL APPLICATIONS IN OFFICES

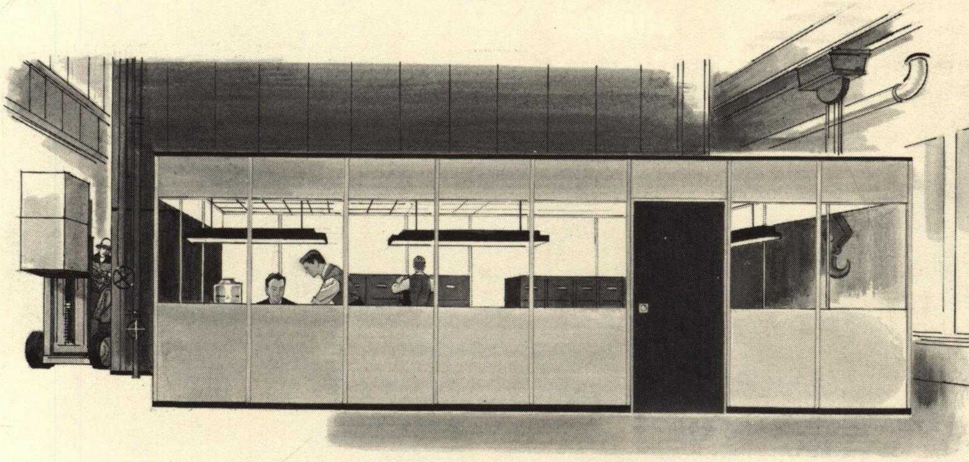




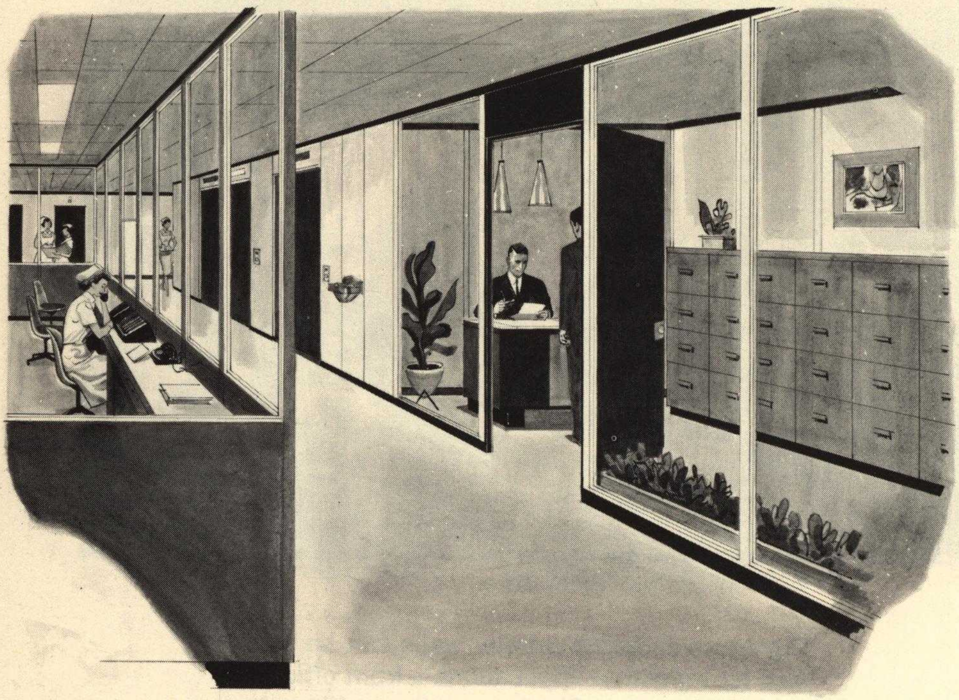
TYPICAL APPLICATIONS
IN INDUSTRIAL PLANTS



Signature movable interior walls can be specified for industrial applications—from offices to production areas. Plant supervisory offices, tool cribs or stores all use the standard prefabricated units. There is a practically unlimited variety of elevations and heights which can be achieved with different combination of panels. The Signature system can be used to help establish the most efficient and the safest traffic flow pattern.

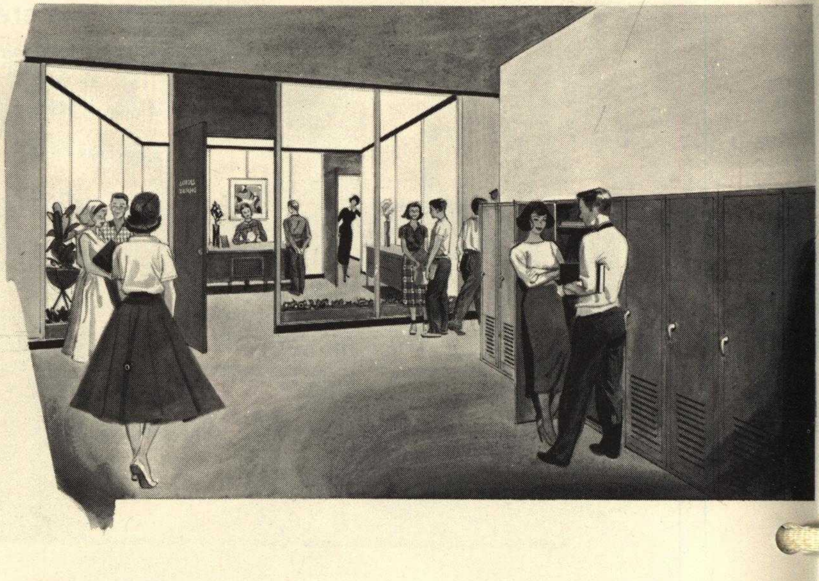


TYPICAL APPLICATIONS
IN HOSPITALS—SCHOOLS



The Signature system is particularly adaptable to many hospital applications—general administration, diagnostic offices and patient rooms, for example. The flexibility of this wall system permits easy movement of panels, either to rearrange space or, temporarily, to permit the movement of large pieces of equipment from one area to another. Because Signature panels are finished in baked-enamel they never need repainting; soap and water washing maintains original finish indefinitely. Maintenance costs are reduced to a minimum.

Schools can be occupied quicker when Signature walls are specified, and rearrangement of interior space to meet changing needs is possible without tearing down and rebuilding of interior walls. Lower maintenance costs are an important factor, too.



THE PRIMARY CONSIDERATION IN THE SELECTION OF A MOVABLE WALL SYSTEM

is the requirement of the job and the degree to which any particular system meets that requirement. All of the values offered in the Signature system are made possible by the details of its design and construction.

The following pages, of extreme interest to architects and designers, are equally important to the members of management charged with the responsibility of a decision on the kind of wall system a building will have. The product details presented in the following pages are further evidence of the advantages of specifying the Signature wall system . . . the very latest development in methods of dividing space.

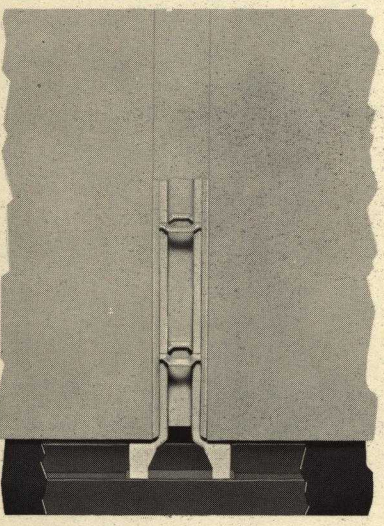
by Hauserman

BASIC PRODUCT FEATURES



universal post

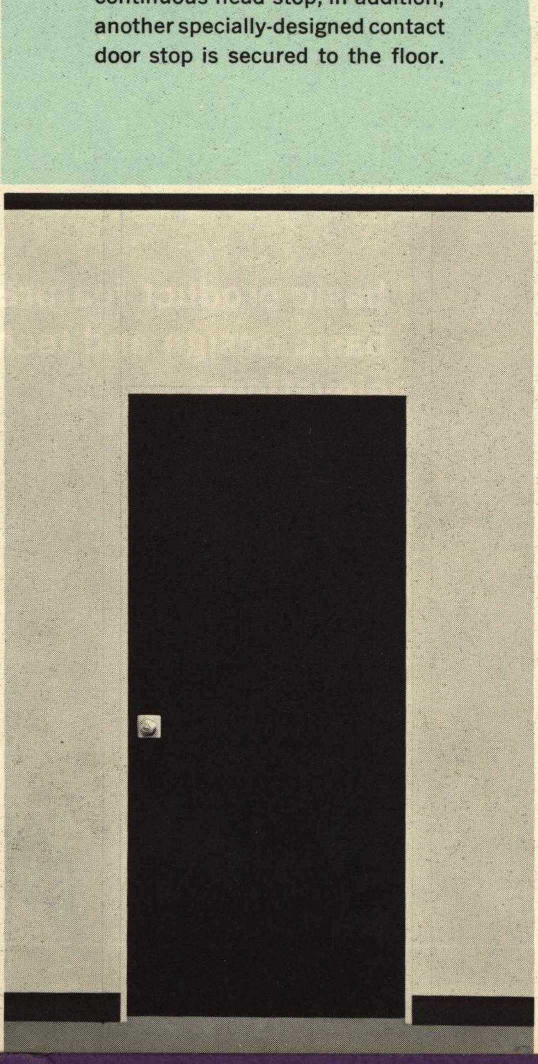
The flush Signature post is locked together by specially designed 10 ga. "keys" which are driven into key stops in a supporting inner member at pre-engineered locations. These keys draw adjacent panels tightly together at one, two, three and four-way conditions. The 14 ga. inner member is concealed behind a continuous grip snap-on post cap, reducing the number of exposed vertical lines between solid panels to two. Easy initial installation is made possible by these elements—and subsequent takedowns for relocation are accomplished quickly.

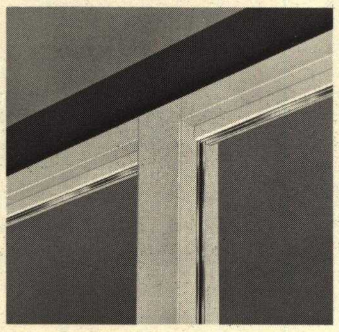
Adequate clearance is allowed in post for wiring . . . switches and outlets are placed in vertical positions on post caps.

To compensate for floor irregularities, the post is shimmed level with universal shims beneath a supporting 12 ga. stilt which has been designed to permit wiring in the base, and facilitates removal of panels individually.

door frame and door

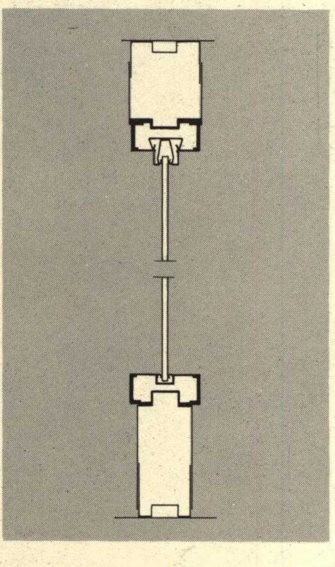
The trim balanced margin Signature adjustable door frame provides for adjustment to varying height floor coverings on opposite sides of the door unit. Jambs are designed to receive a door seal which prevents light leakage and reduces sound transmission. The top jamb overlaps . . . forming a continuous head stop; in addition, another specially-designed contact door stop is secured to the floor.





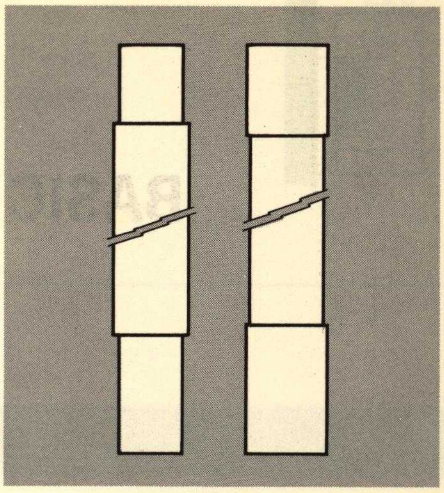
glazing

Aluminum glazing in the Signature system provides a secure, rattle-free installation, without messy putty. Glass can be installed or removed quickly and easily. Posts, horizontal chair rail and ceiling members are offset to take glazing stops pre-assembled to glass before insertion. Top horizontal details are identical for cornice high, ceiling high and transom rail.



recessed or overlapping base and ceiling trim

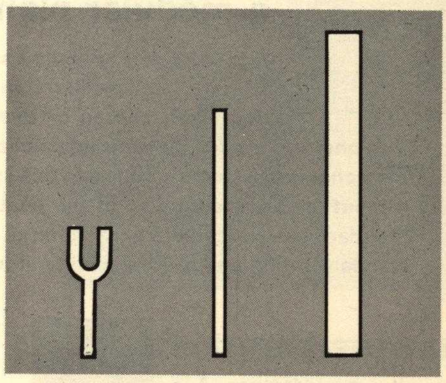
Continuous grip base member provides tight closure and sound seal. Baked-enamel colors may match or contrast with panel colors. Provision has been made for BX wiring and Greenfield in base, ceiling trim, and cornice. Cornice trim is pulled-down tightly with hold-down springs at each post. New double-channel splice provides inconspicuous joints and full rigidity. Signature wiring facilities through ceiling trim, or cornice, down post . . . with wiring divider in base—provides for desired positioning of outlets, switches, heating controls and other electrical needs.



Details . . . pages 19 and 21

commercial post extension . . . thru post—commercial and industrial

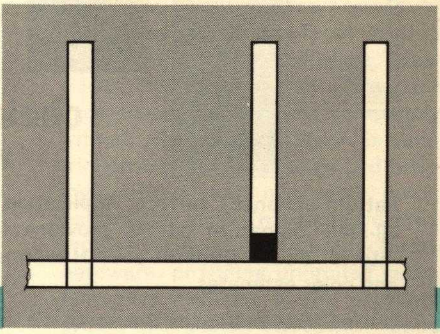
Additional rigidity for ceiling high elevations is provided by a post extension which is secured to the inner supporting member of posts. Splayed and punched to permit continuous pass-through wiring, it is used with ceiling high solid panels, glazed panels and door frames. Support for cornice-high elevations, open above or with top filler, is assured by a thru post used where additional strength is needed. Use of the industrial thru post makes it practical to use this partition for industrial applications where high ceilings and long runs are encountered.

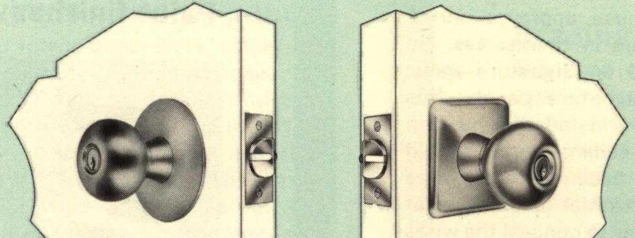


Details . . . page 20

T-adaptor panel

When it is necessary or desirable to begin a panel run in middle of an all-steel panel, the Signature T-adaptor panel is used without interrupting the 4″ module or damaging the panel face. Its construction assures adequate sound control, light proofing and fire safety.





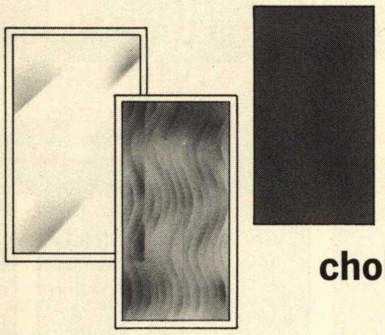
hardware

Signature door cutouts adhere to Federal Specification #161 mortise. Heavy-duty cylindrical locksets and latchsets are available in Dull Bronze US10 and Stainless Steel US32D finish. Hardware from other manufacturers may also be used in #161 mortise, if desired. Complete line of other hardware—exit devices, push and pull plates, closers, masterkey systems, kick plates and thresholds, etc.— are also available for immediate delivery from Hauserman's hardware stock. Hardware can be supplied to any make or system of masterkey.

BASIC DESIGN . . .
AND TECHNICAL PLANNING DATA

a modular plan . . . standard units

Signature's 4″ module can effect economies and is an initial factor to be considered in unified organization. Panel and door unit widths, based on this relative module, may be transposed with one another for dynamic aesthetic changes or purely functional needs. If mechanical systems conform to this system, Signature units may be moved without requiring alteration of the heating, ventilating and lighting systems. Standard prefabricated Signature units provide lower first costs, high quality standardization and aesthetic unity of interior space.



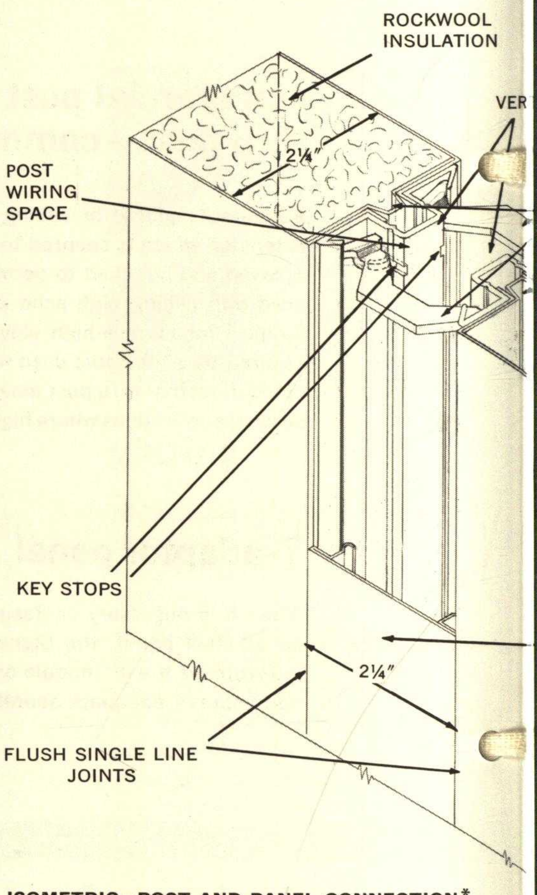
choice of wall materials

Pattern enhances surface. Application of wood veneers and vinyl plastics to all-steel Signature panels provides texture, contrast and warmth to the interior decor. Consult your Hauserman representative regarding choice and color estimates.

Use of glass enhances the aesthetic motif of an office interior. It can be used to indicate openess with polished plate transom or full lite application; obscure patterns add contrasting texture and interesting design due to light refractions. For additional glass information, see page 29.

electrical information . . . wiring

Signature movable interior walls are designed to house approved wiring systems, but are not intended to constitute a system in themselves. No underwriters' electrical labels or listings are carried on Signature walls. General distribution wiring should not be run in Signature panels—this would restrict the movability benefit. In general, where installation has top filler, or where partition is ceiling high—with suspended ceiling—wiring should enter from ceiling. Entrance from ceiling is preferable because switch wires normally originate above the ceiling and because horizontal distribution of wires is continuous along cornice. If there is no top filler to conceal the wires dropping down, entrance from wall is recommended. It is not practical to use rigid steel conduit in Signature because it is difficult to make the necessary short radius turns. Fittings should be mounted on post caps in preference to any other location. Post caps are removable and electrical requirements can easily be changed. Post extension, panel supporting stilt, and locking "keys" have all been designed to facilitate Greenfield cable wiring in the posts. In the base, there is clearance for BX or ⅞″ O. D. Greenfield.



ISOMETRIC—POST AND PANEL CONNECTION*

Paint finishes . . . real wood vene

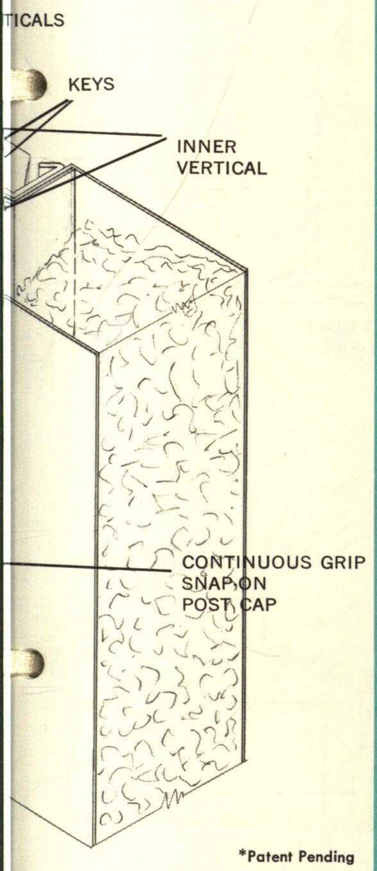
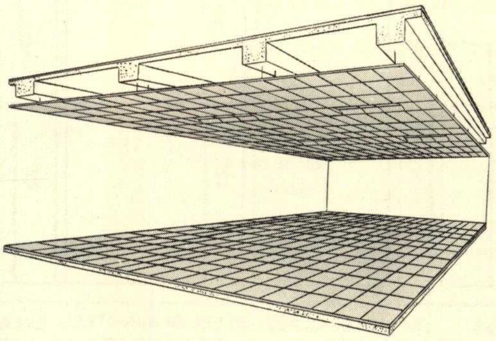
by Hauserman

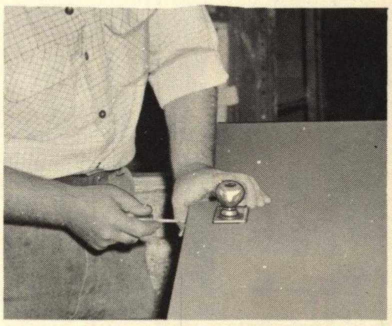


*Patent Pending



planning a structure . . . "through" construction

Substantial time and material costs may be saved by utilization of the "through" or "two-plane" concept . . . when the outer shell of the structure is completed, flooring and ceiling materials are installed first as continuous units. Signature walls are then installed. This is a simpler, less expensive technique than installing three elements room by room. It also permits earlier occupancy.



architectural hardware . . . #161 mortise

Signature locksets and latchsets, Series 6900, are handsome heavy-duty cylindrical locks — available in Dull Bronze US10 and Stainless Steel US32D finishes with round or square escutcheons. It reverses completely without disassembly. Nylon in anti-friction latchbolt, bushings and bearings assures years of smooth, quiet, perfect operation. This standard #161 mortise receives other manufacturers hardware, providing unlimited selection. Also available is the medium-priced lock Series 6800 with round escutcheons.

ers . . . textured vinyls . . . wood panels and doors. Attractive decorators colors are available for fast delivery. Standard colors are shown in Hauserman's Decorator Color Selector. In addition, Hauserman has on formulation thousands of other shades which are available. Standard "egg-shell" finish light reflectancy ranges from 80% downward in value. The alkyd-urea baked-on enamel finish has been subjected to accelerated durability and performance tests . . . see page 29 for test results. The Signature wall system has been designed to accept a variety of wall surface materials . . . real wood veneers, textured vinyls, wood panels and doors. A wide selection of architectural colors, textures and grains are available. A Hauserman representative will assist in selection, application and specification.

Bracing runs . . . ceilings . . . panel weight. Where Signature walls or top filler extend to ceiling, ceiling must be rigid enough to support top member, and any thrust on it. It is neccessary to use a steel ceiling channel in conjunction with fissured glass-wool or rockwool ceiling tile for those suspended ceilings not strong enough to hold ceiling tiles. Where partition runs require concealed tubular reinforcements these should be anchored to the metal ceiling channel. When partition runs are open above in conjunction with the fragile type of ceiling, through post reinforcement shall extend through the ceiling to the structure above. Signature walls are non-load-bearing as stated in building codes and ordinances. However, they are often used to support interior roofs. Weight: All-steel . . . 5.00 lbs. per sq. ft.; DSA glass . . . 1.52 lbs. per sq. ft.; ⅛" obscure glass . . . 2.00 lbs. per sq. ft.; 39 oz. crystal glass . . . 2.44 lbs. per sq. ft.; ¼" polished plate glass . . . 3.30 lbs. per sq. ft.

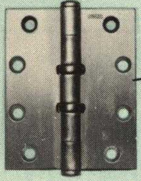
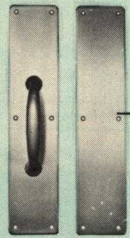
BASIC HARDWARE

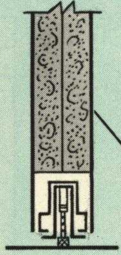


C 601900 — S. Butts are 5″ x 4″. One pair used per door. Butts have ball bearing washers for easy, noiseless operation. Available in US10 and US26D finish.

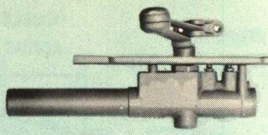


C 601700 — S. Push plate, plain, center located 44¾″ above floor. C 601800 — S. Pull plate, center located 44¾″ above floor. Both available in US10 and US26D finish. Push bars also available.

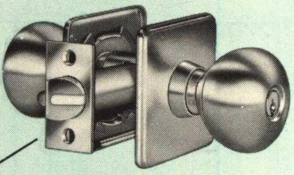
C 607000—S. Threshold — extruded aluminum ⅜″ high, 2″ wide, with ¼″ nigh adapters when specified for special conditions such as rugs, linoleum, etc.



Drop Seal . . . located in bottom of door for light and sound seal.

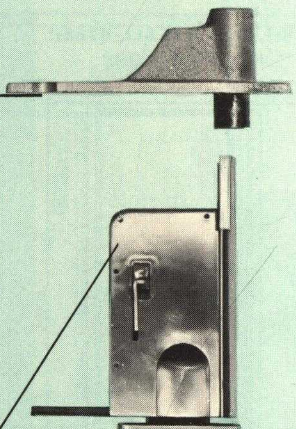


C 604300—S, C 604700—S. Concealed door closer—case completely concealed within door, painted to match door. Hold open arm 110° opening; regular arm 180° opening.



690000—Cylindrical locks and latchsets. Complete reversibility without disassembly. May be master keyed. Minimum projection from 1¾″ door face is 2⅝″. Available in US10 and US32D finish.

C 607600 — S. Kick plates — specify one or both sides. No. 14 ga., 8″ high bronze, or C 607700 — S No. 16 ga. stainless steel, brushed finish.



C 603700—S. Double acting hinges . . . pivot permits doors to swing both ways. It is ball bearing with tension adjustment. Includes floor plate and top pivot. Mounts on surface of floor — no hole in floor required. Available in US10 and US26D finish.

In addition to the above special conditions the new Signature wall can be accommodated to many special requirements. Many other accessories are available. Lining of masonry walls, details for application to door openings, elevator trim, etc.

SPECIFICATIONS — SIGNATURE

1. SCOPE OF WORK:

The E. F. Hauserman Company Signature 20 (2¼" thick, flush type), erected complete, shall be the basis for all bids. For comparison purposes, certain products of other manufacturers may be quoted on bid forms as alternates, stating manufacturer, type, deviations, and amount to be added or deducted for each substitution.

2. QUALITY OF INSTALLATION:

Entire installation shall have flat panel surfaces and tight straight line joints. Components shall not shrink, swell, warp, crack or open up, and shall assemble into a rigid structure which will retain its original appearance indefinitely. All units shall be readily removable without disturbing adjacent units. Doors and panels of like size shall be readily interchangeable. Layout changes shall be possible easily, quickly, economically, without dirt or debris and with 100% salvagability of materials. Unit design must permit expansion in two, three and four way conditions, without removing existing units. After installation, partitions shall be free of exposed bolts, nuts, rivets, or screws, and all finished surfaces shall be free of tool marks.

3. ERECTION:

All partition runs shall be installed on top of finished flooring. Partition shall be scribed and neatly fitted to existing building conditions, erected in a rigid and substantial manner, straight and plumb, with horizontal lines level. Units shall interlock and align at the panel and door unit joints. Floor fastenings shall be concealed and adjustable to floor level. Partition contractor shall provide reinforcements or through posts to ceiling wherever required to assure lateral stability of all partition runs.

4. MATERIALS:

All exposed steel shall be full-pickled, cold-rolled, furniture stock steel, free of defects, pits, scales, buckles or seams. Gauges specified are U. S. Standard.

5. PARTITION PANEL UNITS (SOLID OR GLAZED):

Panel units shall be flush, 2¼" thick, rockwool insulated, factory assembled into a complete unit. Partition unit verticals shall be No. 14 ga. rolled steel securely connected to panels, and completely concealed on all steel panels. Panel plates shall be No. 20 ga. roller-leveled steel with horizontal reinforcements 12" apart, welded to back face of panel with a double row of spotwelds 3" on center to assure uniform thickness and flatness. Lower panels for glass units shall have the top edge formed to provide the glazing groove.

Where glazed partitions are shown on the plans, bottom and top glazing rails shall be No. 16 ga. steel shapes. The one-piece unit top rail shall provide a center recess to receive and retain a snap-in, 22 ga. rolled steel glass stop, applied as part of glazing assembly. Mullion width between glass shall not exceed 2¼".

6. POST AND POST CAPS:

The panel unit verticals shall have key stops to position 10 ga. steel post keys spaced not more than 18" o. c. on each side of the partition post, to prevent slipping and resultant misalignment of panel and door units. Post keys shall space and hold the panel unit verticals in a positive position, without connections or engagements in the post cap. Edges of the panel vertical and the 20 ga. rolled post cap shall be shaped to provide a continuous engagement for the full height of the partition, providing a positive sound seal and permitting installation and removal without distortion. Post caps are to be installed individually from each side of the partition, flush with the panel. Panel verticals shall also be provided with a saddle at the bottom to allow adequate space for wiring. Each post shall be leveled with floor shims to compensate for floor variations, and maintain a permanent level.

7. BASE RECESSED:

(See paragraph 10 for matching ceiling trim.)

Base shall be No. 18 ga. steel shape 3¾" high, with ¼" recess behind panel face, continuous without plinths, and adjustable to floor variations. Base shall install individually from each side of partition to allow continuous wiring. Base shall be attached continuously at the top by a 20 ga. steel member securely fastened to bottom panel edge, and by a No. 18 ga. steel shape floor channel at the bottom, continuous except at doors and openings, securely fastened to floor to prevent lateral movement. Floor channel shall be designed to provide for a continuous light and sound seal at the floor contact.

8. BASE OVERLAPPING:

(See paragraph 11 for matching ceiling trim.)

Same as recessed base except base shall be No. 18 ga. steel shape, 4" high, with 3/32" projection, continuous without plinths.

9. CORNICE:

(Used when panels do not extend to ceiling)

Cornice shall be No. 14 ga. rolled steel shape, 2¼" high (to match width of post cap) 3 5/16" wide, to provide lateral stability. Cornice shall provide space for concealed wiring. Corners shall be mitred, welded and disced absolutely smooth.

Top flanges of cornice shall be reinforced with spot welded tie bars spaced not more than 24" o. c.

Each cornice field joint shall have a double No. 10 ga. steel, concealed expanding pull-up splice at least 20" long to maintain structural rigidity equal to the cornice itself, and to provide perfect vertical and horizontal alignment.

Cornice shall have punchings every 4" to locate panel connections and to permit wiring or concealed reinforcement at any post. The concealed cornice pull-up splice shall have similar punchings.

10. CEILING TRIM RECESSED:

(In place of Cornice)

Ceiling trim shall be No. 18 ga. steel shape with ¼" recess behind face of panel, continuous. Ceiling trim shall be adjustable to variations in ceiling level. Trim shall be installed individually from each side of the partition to allow continuous wiring facilities. Trim shall be attached continuously at the bottom, securely connected to the top edge of the panel and by a ceiling channel at the top. Ceiling channel shall be No. 18 ga. steel shape securely fastened to the suspended ceiling. Ceiling channel shall be designed to provide for an inorganic seal at the ceiling.

Each one-way post shall be braced at the ceiling with a post extension No. 16 ga. steel to provide a rigid connection of panel post to ceiling channel. Post extension shall be functionally designed to permit continuous wiring.

11. CEILING TRIM OVERLAPPING:

(Omit for Cornice High)

Same as recessed except ceiling trim shall be No. 18 ga. steel shape, continuous.

12. END FILLERS:

Partition end fillers to fixed walls or columns shall be double steel No. 20 ga. sheets, rockwool packed. End filler panels shall fasten securely to adjacent panel unit verticals, creating a single line joint, and fitting neatly into a channel securely fastened to the building wall. Any irregularities behind wall channel must be sealed against light and sound by a compression seal which can be removed without damaging the wall.

13. TOP FILLERS:

(Omit if no top filler is required.)

Double plaster board top filler shall extend from the cornice to the ceiling and shall be sheets ⅜″ thick, neatly scribed at ceilings, walls, beam drops, pipes, etc. Joints shall be reinforced, pointed, smooth finished, and top fillers painted by partition contractor.

No. 20 ga. steel clips shall be spaced approximately 12″ o. c. in the top groove of the cornice to position the double plaster board.

Where ceilings are suspended and level, particularly where acoustical ceiling materials are used, specify: steel ceiling channels shall be able to receive double plaster board top filler, and have a continuous compression seal to prevent light and sound leaks resulting from ceiling irregularities.

14. DOUBLE STEEL TOP FILLER:

Double steel top filler for partitions shall extend from cornice to ceiling, with a 20 ga. continuous steel member installed in cornice groove to support and position double steel top filler sheets. Flush line joints shall be uniformly spaced and readily removable. If sound control is required, specify top filler is to be packed with rockwool. Finish shall be factory applied to match partitions.

15. DOORS AND FRAMES:

All flush and one-lite doors shall be 1¾″ thick with 3/32″ clearance at jambs, 1/16″ clearance at head. Doors shall be manufacturer's standard, with glass in upper panel or flush steel solid type, as specified. Doors shall be No. 20 ga. steel with edge lock joints, rockwool insulated. Doors shall be reinforced at top to mount either concealed or surface type closer, and doors shall be glazed in a manner similar to panel units without use of screws, or loose glazing stops. All doors shall be furnished with a floor type door stop.

Door frames shall be cold rolled, one-piece welded No. 18 ga. steel, with a slip-fit adjustment at the head to compensate for floor irregularities, and with a continuous vertical closure strip and continuous head stop. Frames shall be mortised and reinforced for specified hardware and to permit interchange of locks for any hardware operation.

16. HARDWARE:

Hardware shall be designed and constructed to fit the U. S. Federal Specification No. 161. Locksets of different operations shall be interchangeable. Doors shall be hung on one pair non-friction, oil-free bearing hinges.

NOTE: Check partition contractor for information on other applicable hardware.

17. ELECTRICAL PROVISION:

(Omit if no electrical fittings are required.)

Partition contractor shall provide cutouts (post caps factory punched before painting) 50″ above floor for electrical switches and 14½″ above floor for outlets. Partition contractor to furnish switches, duplex plug receptacles, flush plates (stainless steel) for all locations shown on plans. All conduits, electrical wiring and connections by others.

18. FACTORY FINISH:

All exposed surfaces shall be prime coated, with no surface painted before it is clean and dry. A finish coat of uniform color and texture shall be applied to all exposed surfaces. In addition, back sides of panel plates shall be either prime coated or shall have a protective coating.

Each coat shall be oven-baked at proper temperature to polymerize the finish. Material shall be lightly sanded between coats to reduce high spots. Finish coat shall have eggshell texture. Manufacturer to furnish independent laboratory test data on finish performance.

19. GLASS AND GLAZING:

Glass of specified design, quality and thickness shall be furnished by the partition contractor.

Glass shall be bedded in aluminum glazing channel to provide firm retention and seal, without exposed screws, and shall permit easy installation and removal without damage.

20. CLEAN-UP:

All cartons and rubbish shall be removed, and work left broom clean. Minor blemishes and defects shall be touched up. Cleaning of glass and erection dust is considered maintenance work.

PAINT FINISH

Performance Tests: Commercial Cleaner Resistance—spot tests with 3% solutions of three commercial cleaners for 24 hours under watch glass with no softening and no appreciable change in color or general appearance. Kreelon 4 D, APCO 4316, Floor San. Stain Resistance — shall withstand the following when exposed under glass at room temperature for times indicated, with no more than trace of stain allowable: Mercurochrome—4 hours; tincture of merthiolate — 4 hours; hair oil, creme type (Wildroot) — 4 hours; solution type (Vitalis)—4 hours; black ink (Skrip Washable)—4 hours; synthetic-perspiration (Winchester-Arms formula)—1 hour. Hardness—shall withstand 500 gm load of a Hoffman hardness tester. Impact — shall withstand a direct impact of a minimum of 20 inch-lbs. (using ½″ diameter steel ball) with no cracking. Appearance Uniformity—Resistance to Dry Rub: run 250 cycles on Gardner Model 105 Washability and Abrasion Machine, using cheese cloth over felt pad. There shall be no increase in gloss as measured by Gardner 60-degree Glossmeter. Heat Test: there shall be no appreciable appearance change or loss in film properties after 200 hours at 150 degrees F. Ultra-violet Resistance: there shall be no appreciable color change after 200 hours in the Atlas Fadeometer. Light and and Darkness Color Uniformity: a panel approximately 4″ x 12″ is half covered with heavy aluminum foil and placed in diffused daylight for one week. No apparent color change between the covered and uncovered areas is allowed. Accelerated Weathering — 400 hours exposure in a National Carbon Co. X-1-A Weathering Machine, with no fading or rusting (slight dulling and chalking of surface permitted). Humidity Resistance—400 hours in atmosphere with 100% humidity and temperature 100 degrees F. with no appreciable deterioration. Washability — 400,000 brush strokes while immersed in a 5% solution of trisodium phosphate in a Gardner Straight Line Washability Machine (Model 105) without any softening or more than slight abrading of the paint film. Chemical Resistance — Alkali: no etching, blistering, cracking, or changing color. (Slight loss of gloss permissible.) 50% sodium hydroxide—1 hour, 28% ammonium hydroxide — 4 hours. Acid: same performance characteristics as in alkali test. 50% sulphuric acid — 4 hours, 10% phosphoric acid—4 hours, 5% hydrochloric acid — 4 hours, 5% acetic acid — 4 hours, 5% nitric acid—1 hour.

SPECIFICATIONS—GLASS

⅛″ thick — max. glass size 20 sq. ft. total area
3/16″ thick — max. glass size 30 sq. ft. total area
7/32″ thick — max. glass size 30 sq. ft. total area
¼″ thick — max. glass size 35 sq. ft. total area
over ¼″ thick — max. glass size 50 sq. ft. total area

Continued on page 30

These limits apply to all types of glass. Thicknesses are for nominal standard sizes. Length and width limitations are governed by the Manufacturers standards, but the sq. ft. area should not exceed above. Glass ¼″ thick (clear or obscure) is recommended for full lite doors, glazed railing or when glass is sand-blasted or chipped in pattern. Use 39 oz. crystal for reasons of safety. Double-glazed partitions are glazed with two pieces of glass hermetically sealed — clear or obscure ½″ apart. Maximum size stocked is 44⅝″ x 40″. Allow 10 weeks for procurement of larger sizes or different type of glass for the two lites. 39 oz. crystal not stocked for lites over 50″ high. Patterned glass with ribs running vertically not stocked for lites over 48″; with ribs running horizontally, the height may run to 60″. All glass types used in Signature walls are furnished by the leading glass manufacturers in the field.

SPECIFICATIONS—TEXTURED VINYL WALL SURFACE

Partition panel units where specified shall have a decorative vinyl laminate applied to the 20 ga. steel panel plate.

The vinyl laminate shall be .008″-.010″ minimum thickness of colored and/or textured vinyl which has a transparent protective vinyl overlay of .002″ thickness. The vinyl shall be bonded permanently to the 20 ga. steel panel plate.

All vinyl surfaces shall be free from bubbles, blisters or unbonded areas. Color, pattern, and texture of the decorative surface shall be as selected.

Vinyl-metal surfaces shall have good abrasion resistance and durability against scuffing and wear. They shall be completely washable by approved soaps and cleaning agents, and shall maintain permanence of color and texture.

The steel panel plate shall have horizontal reinforcements 12″ apart glued to back face of panel with a thermoplastic type adhesive.

A .001″ thickness of vinyl shall be applied to the back face of the steel panel plate.

SPECIFICATIONS—WOOD VENEER PANEL SURFACE

Partition panel units where specified shall have a real wood veneer laminate applied to the face of the 20 ga. steel panel plate.

The wood veneer shall be 1/85″ thickness bonded permanently to the steel panel plate. The steel panel plates shall have horizontal reinforcements 12″ apart welded to back face of panel with a double row of spotwelds 3″ on center.

Panel plates with reinforcements shall be finished with a prime coat on all front and back surfaces and a cover coat of alkyd-urea finish on the front surface before lamination of the wood veneer.

Species and cut of wood veneer shall be as selected. Wood veneer shall be finished with a sealer coat and two coats of Satinlac.

SPECIFICATIONS—WOOD PANELS

Wood panels, when specified, shall be constructed as follows:

Cores shall be solid wood, formed of Basswood or poplar strips, not to exceed three inches in width. When specified, wood cores shall be given a non-combustible (complete impregnation) treatment. As an alternate to the treated wood core, a non-combustible mineral core may be used.

Crossbands shall be not less than 1/16″ thick plywood crossbanding or hardwood veneer of random width. The edge banding shall be profiled to provide a connection of the wood panel to the partition structure.

The finished, natural veneered, wood surface shall not be more than 1/28″ thick and shall be of species and cut as specified.

Face veneer will be finished with lacquer or oil-rubbed to following specifications:

LACQUER FINISH

1. Coat of lacquer sealer.
2. Sand.
3. Coat of clear lacquer.
4. Sand.
5. Coat of clear lacquer.

OIL-RUBBED FINISH

1. Burnish sand.
2. Coat denatured alcohol, wipe before alcohol evaporates.
3. Coat boiled linseed oil.
4. Wipe with rayon cloth.
5. Coat boiled linseed oil.
6. Wipe with rayon cloth.

Face veneer shall be full length, matched for color and grain to produce balance and continuity of character.

SPECIFICATIONS—WOOD DOORS

Wood doors shall be flush or one lite, solid core, 1/28″ face veneer, 1/16″ cross band, matching vertical edges, untreated wood core. Doors shall be 1¾″ thick, reinforced and mortised for specified hardware (butts, #161 locksets, concealed or surface closers, etc.)

Door finishes shall be lacquered or oil-rubbed to following specifications:

LACQUER FINISH

1. Coat of lacquer sealer.
2. Sand.
3. Coat of clear lacquer.
4. Sand.
5. Coat of clear lacquer.

OIL-RUBBED FINISH

1. Burnish sand.
2. Coat denatured alcohol, wipe before alcohol evaporates.
3. Coat boiled linseed oil.
4. Wipe with rayon cloth.
5. Coat boiled linseed oil.
6. Wipe with rayon cloth.

All doors are to be random or book matched with adjacent panels as specified. If required, fire proofed cores are available.

SPECIFICATIONS—MAXIMUM SOUND CONTROL

Extreme care has been taken in the design of the partition perimeter fit and seal to the building structure (floors, walls, and ceilings) also the design and fit of all trim members (base, ceiling trim, post caps) to assure a uniform efficiency in sound transmission reduction as a standard for the product. There are occasions, however, when the very maximum is required. The following is to be added, when required, to the regular partition specifications:

(a) The partition posts shall be solidly insulated with rockwool during erection of partitions.

(b) Space within cornice and/or ceiling trim shall be solidly insulated with rockwool during erection.

(c) The partition base shall be solidly insulated with rockwool during erection.

(d) Top Filler (if any) shall be solidly insulated with rockwool for its full heights.

(e) Metal threshold shall be furnished at each door. Thresholds shall raise the floor level below the door to the point at which rubber wiper attached to the bottom of the door shall make continuous sliding contact for the width of the door.

A continuous wiper shall be installed in the bottom of each door in such a manner as to make contact with threshold as mentioned above.

(f) Baffles shall be installed by ceiling contractor above suspended ceiling over each partition run.

(g) Glazed partition runs (if any) shall be glazed with hermetically sealed double glass panels. All four edges of the glass shall be well sealed to prevent sound leakage around glass.

Results of Sound Performance Tests are available on request.

DELINEATOR

As a companion system to Signature, The E. F. Hauserman Company introduces the new Delineator, which provides the greatest possible degree of variety within the disciplines of prefabrication.

CUSTOM

The E. F. Hauserman Company solicits your inquiries about Custom wall systems, designed to answer your particular requirements on any project.

Contact your nearby Hauserman representative for further information concerning DELINEATOR or your CUSTOM requirements or write:

Movawall

A NEW CONCEPT IN SPACE DIVISION

MOVA-WALL partitions insure privacy and beauty as well as divide space where efficiency and economy are of the utmost importance. As shown on the following pages, many unusual and attractive panel combinations are available. Mova-Wall partitions are so versatile that even during installation, changes can be made without added cost or delay.

For complete information, call the MOVA-WALL representative in your area to explain how these partitions can help you effectively allocate space in any area at a very moderate cost.

ADVANTAGES:

LOW COST –Simplicity of design and fewer parts make Mova-Wall partitions cost less than most methods of dividing space. In some cases the cost is even lower than plaster or dry wall.

IMMEDIATE AVAILABILITY –Your local distributor maintains a complete inventory of parts to meet most job requirements. This is of particular advantage should changes or additions become necessary during installation or at a later date.

EASILY MOVED AND REUSED –Can be easily moved and rearranged without mess, disturbance, or waste.

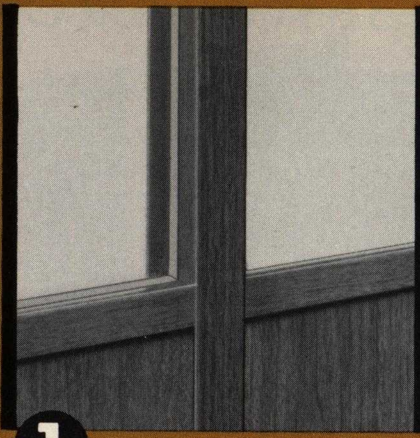
ATTRACTIVE APPEARANCE –Available in numerous panel designs as illustrated on the following pages. Any color or finish is available; or partitions may be painted after installation to harmonize with existing color schemes.

VERSATILITY –Standard size panels may be cut and shaped on the job to meet any space requirement, thus saving time and permitting changes in design as required.

EARLIER OCCUPANCY –Fast, easy installation permits valuable office or factory space to be occupied at a much earlier date than other types of wall construction.

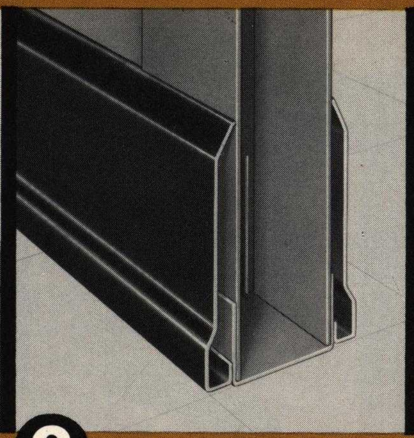
IMPROVED EFFICIENCY –Clearly defined office areas and traffic lanes step up efficiency. Better employee morale results in greater production in office or factory.

© HENGES CO., INC. 1959



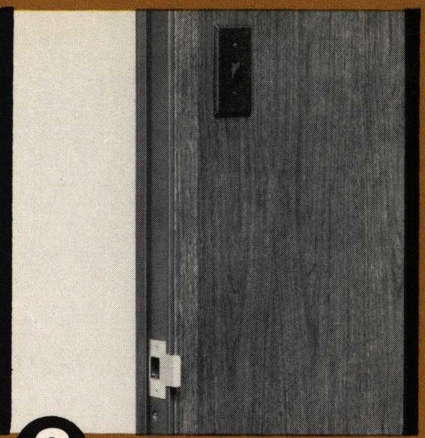
①

WINDOWS: Glass is cushioned in dust-proof plastic gaskets and is easily replaced. Trim is completely flush on both sides with no exposed screws or fastenings.



②

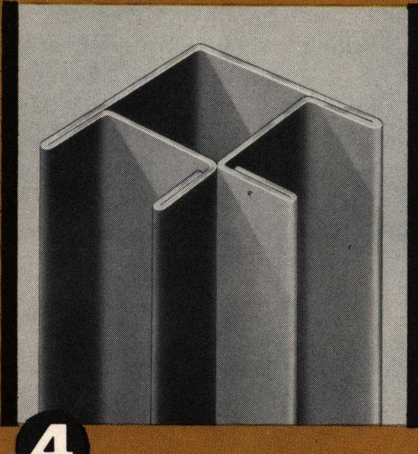
BASE: Steel with baked-on black enamel finish. Snap-on feature makes it easy to install or remove for quick access to concealed wiring channel, and provides for necessary electrical outlets.



③

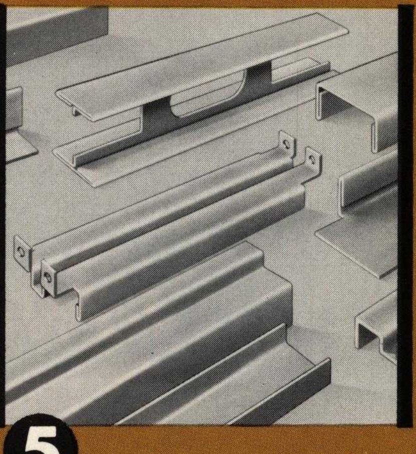
DOOR FRAME: 16 gauge steel door frames for 1⅜ inch wood or metal doors. Fits flush with partition trim. Designed for cylindrical lock sets. Electrical switches mounted in panel as shown, or in wiring studs. 1¾ inch doors and frames also available.

EFFICIENCY IN EVERY DETAIL



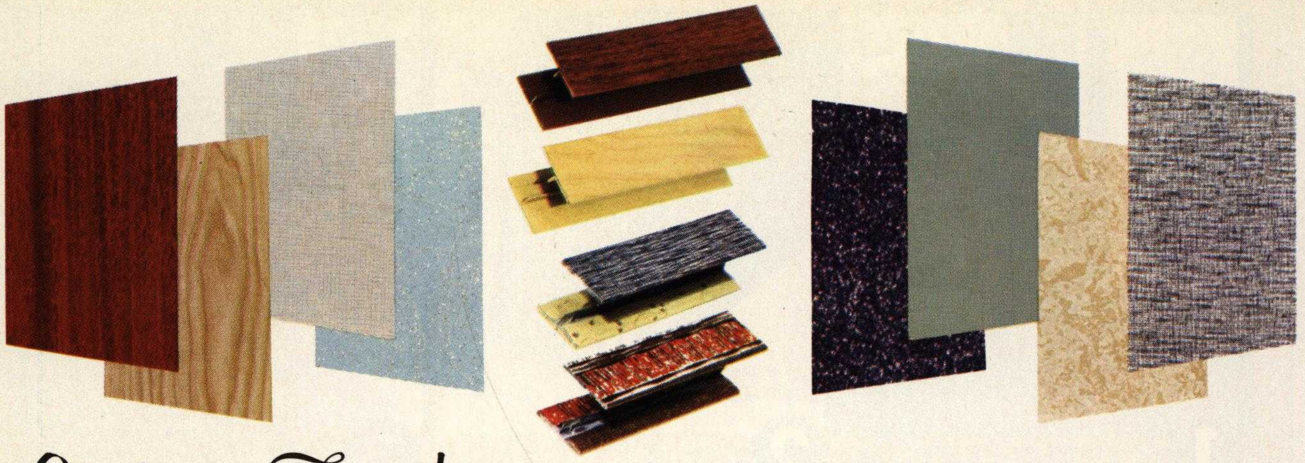
④

CORNER POSTS: Single piece roll-formed steel. Structurally stronger, more attractive, and easier to assemble. Hollow construction permits easy wiring.



⑤

METAL PARTS: A minimum number of metal parts required. All parts are roll-formed with hemmed edges to eliminate sharp surfaces. Electrolytic zinc coating for rust prevention and paint adherence.



Custom Finishes . . . . IN STOCK

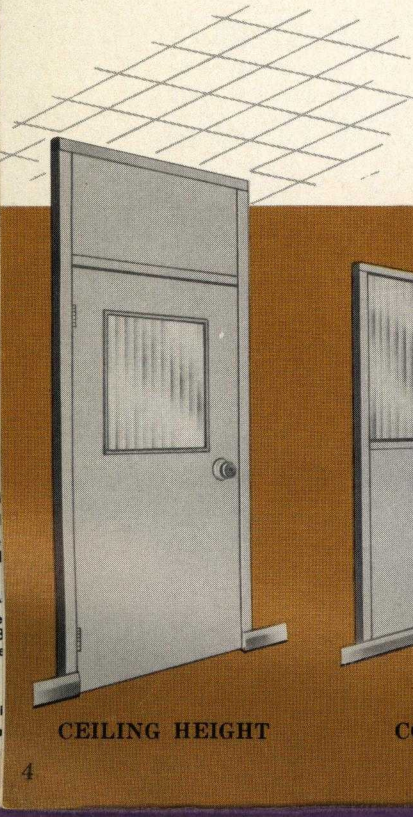
A wide selection of colors and textures permits a choice of any finish that suits your particular needs and tastes. You'll find it easy to match or harmonize with existing decor.

A variety of melamine-faced wood-grain panels with matching metal trim is available to create rich, harmonious wood-grained interiors. Textured vinyls in many solids or patterns can be used to add beauty and distinction to any Mova-Wall installation.

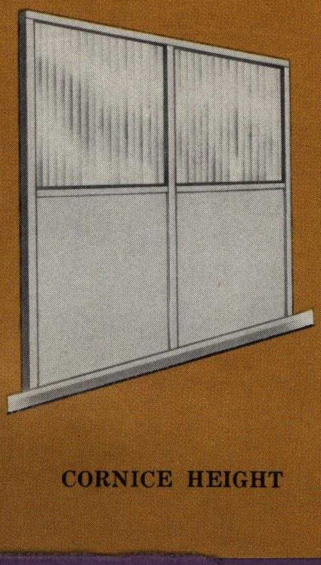
High-temperature, baked-on enamel is used for factory finished surfaces. Mova-Wall can also be furnished and installed unpainted for finishing by your own contractor.

A Movawall TYPE FOR EVERY NEED

The overall versatility of Mova-Wall gives you freedom to tailor partitions to meet your exact requirements. Clear glass panels for vision or obscure glass for privacy while utilizing borrowed light. Consult your local distributor for any special design to meet your specific need.



CEILING HEIGHT



CORNICE HEIGHT

MOVA-WALL

PANEL CONSTRUCTION

Mova-Wall paneling has been engineered to provide quality construction and long life. Mova-Wall panels, 1⁹⁄₁₆ inches thick, achieve good sound transmission loss ratings and, at the same time, save valuable space. Panel modules can conform to any job requirement and may be 10 or 12 feet high without use of filler panel . . . depending on panel material used. Panels may be of steel, wood, vinyl, gypsum board, hardboard, cement, asbestos board, and many others to suit specific need.

A GYPSUM BOARD PANEL . . . Lowest in cost. Excellent sound transmission loss of 34.7 decibels.* Constructed of ½ inch thick gypsum board with gypsum board spacers as core.

B HONEYCOMB CORE PANEL . . . Its low cost and light weight make it one of the most popular panel cores to which facings can be laminated. Most often used facings are pre-enameled hardboard or steel. It is ideally suited for cornice and railing applications.

C SOUND ABSORBING PANEL . . . Where both sides are perforated, ⅜ inch thick gypsum board is used as a sound baffle and acoustical batts are used to absorb sound. Usually furnished with baked enamel finish.

D MARLITE WITH GYPSUM BOARD CORE . . . ⁵⁄₃₂ inch Marlite laminated to two layers of ⅝ inch thick gypsum board produces a sound transmission loss of 39.3 decibels.* Excellent for full privacy and sound control.

*Based on actual tests by Geiger-Hamme Laboratories of complete partition — not just panels. Complete test findings available on request.

CEILING HEIGHT: For maximum privacy and sound control. Fastens securely to almost any ceiling including suspended acoustical.

CORNICE HEIGHT: A slightly lesser degree of privacy, but more economical. Sometimes necessary because of existing heating or air-conditioning systems. Usually 7 or 8 feet high.

GLAZED RAIL: Provides semi-private work areas and eliminates visual distractions to seated employees while allowing for supervisory control. Special stiffening device assures permanent rigidity. Usually 54 to 66 inches high with 12 to 24 inches of clear or obscure glass.

PLAIN RAIL: The simplest and most economical area divider — 42 inches high or less. Permits full supervisory control from seated position.

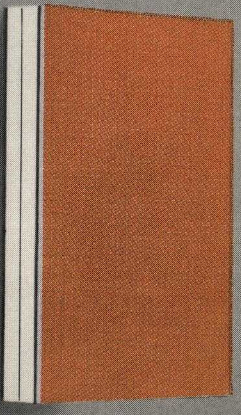
D



SPECIFICATIONS

GENERAL: Furnish and install Mova-wall partitions and/or railings as manufactured by the Henges Company, Inc., St. Louis, Missouri. Partitions shall be of the flush panel type and panels shall be 1$\frac{9}{16}$" thick. Partition trim shall not protrude more than ⅛" from finished panel surface.

MATERIALS: All partition metal parts shall be minimum 20 gauge electrolytic zinc-coated steel. Studs, corner posts, and other framing members, shall be one piece roll-formed 18 gauge zinc-coated steel. Cove, flat, or louvered base shall be black baked enamel snap-on type with no exposed screws. Wiring studs shall be supplied where required.

DOORS AND FRAMES: Frames for 1⅜" thick doors shall be 16 gauge zinc-coated steel, flush with partition trim, and have 1 pair 3½ x 3½ butts. Frames for 1¾" thick doors shall be zinc-coated steel, and have 1½ pair 4½ x 4½ butts. All frames shall be machined to receive hollow steel or wood doors as specified, and cylindrical hardware.

PANELS: Panels shall be (gypsum board, cement asbestos board, pre-finished hardboard, sound absorbing, etc.) and shall be in 4′ modules where practical. Independent laboratory tests shall be furnished to show sound transmission loss through partition under actual field conditions. Acoustical panels shall have skin of perforated hardboard having $\frac{3}{32}$" diameter holes on ¼" staggered centers. Core shall have gypsum board baffle and glass fibre pads giving an NRC of 60 or better.

GLAZING: Partitions and railing shall be glazed with ________ (type) glass cushioned with vinyl gasket. Glazing shall be of flush type, with no exposed screws. Mullions shall not be more than 1¾" wide.

FINISHING: Partitions shall (have factory applied high temperature baked enamel finish) or (be field painted with two coats paint as specified) or (have wood-grained finish on panels and metal trim).

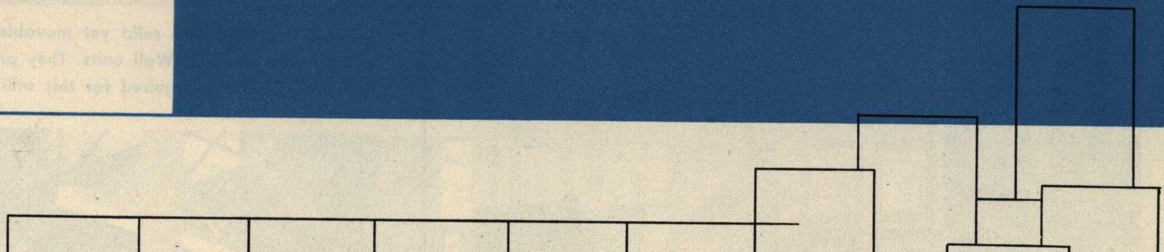
Johns-Manville

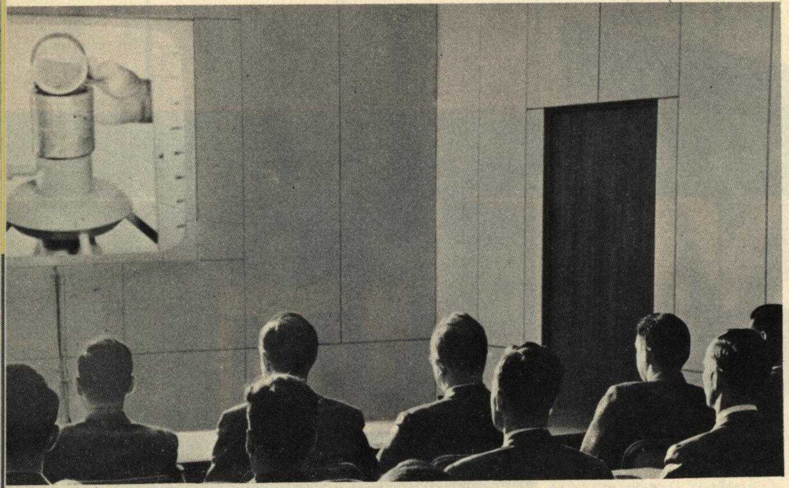
ASBESTOS *movable walls*



A.I.A. File No. 35-H-6

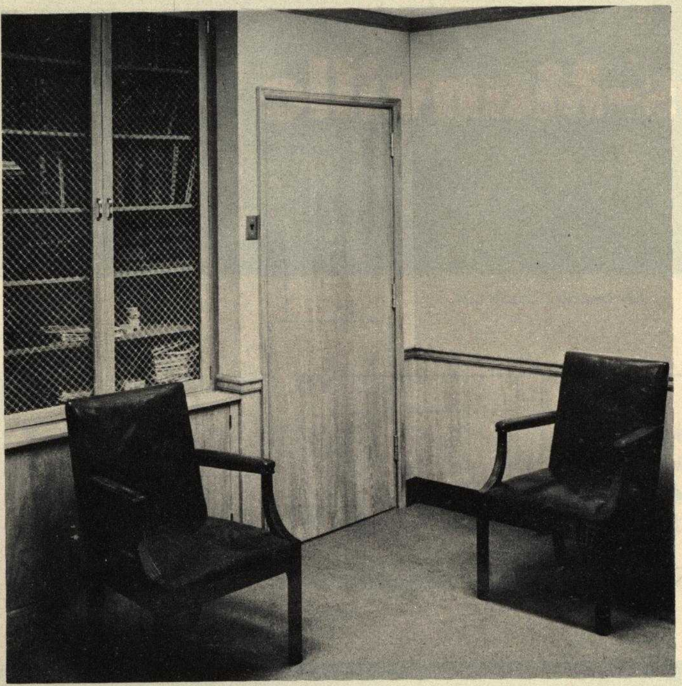
1960

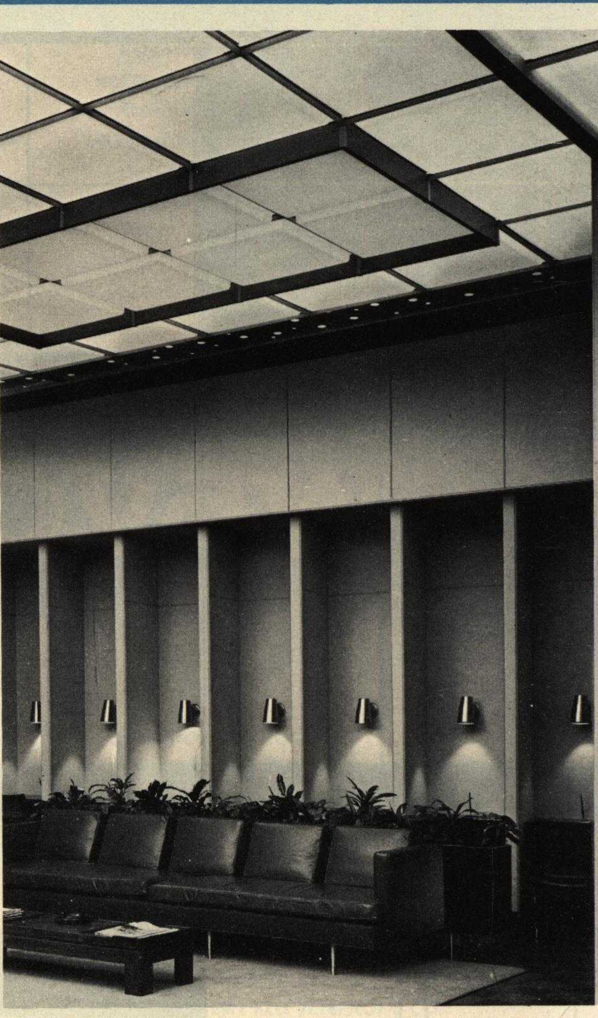
a JOHNS-MANVILLE JM PRODUCTS movable wall . . . .



Above—The picture screen is within the Imperial Movable Walls of this modern meeting room. Such installations can be accomplished economically using only standard elements.

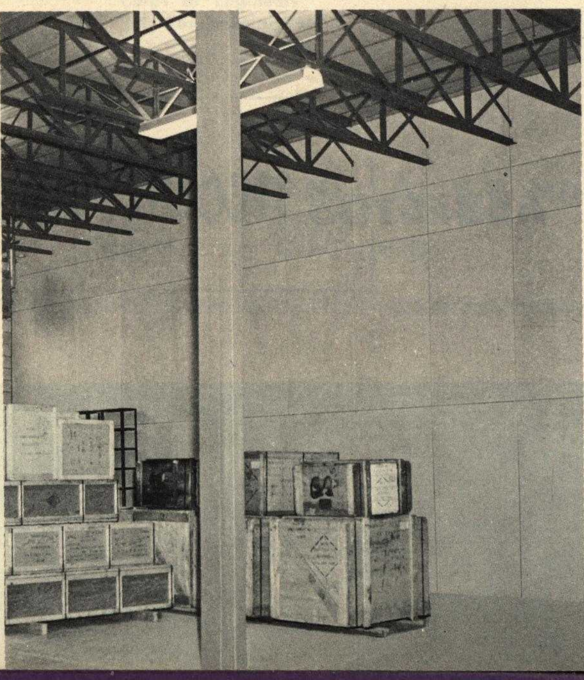
Below—Covering the panels with fabric and building in a handsome break-front type bookcase, gives the Johns-Manville movable walls of this executive office a traditional look.



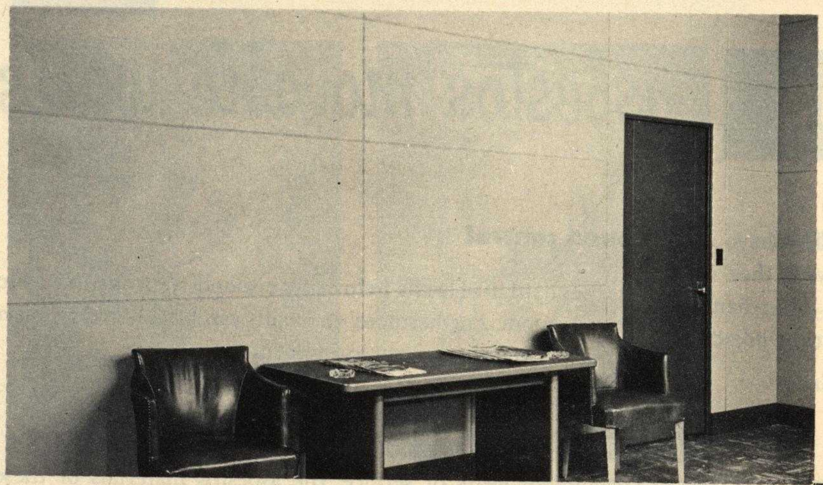


Above—Slender alcoves, glass areas to the floor and an exceptionally high ceiling are some of the features of this dignified and spacious interior built in rapid time with Imperial Movable Walls.

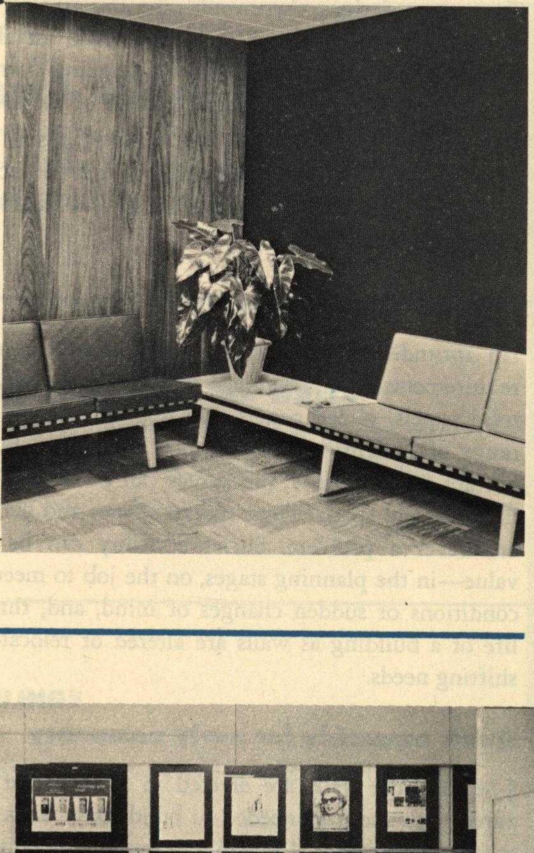
Below—This rigid and solid yet movable warehouse partition is built with Imperial Wall units. They provide the fire protection and durability required for this utilitarian installation.



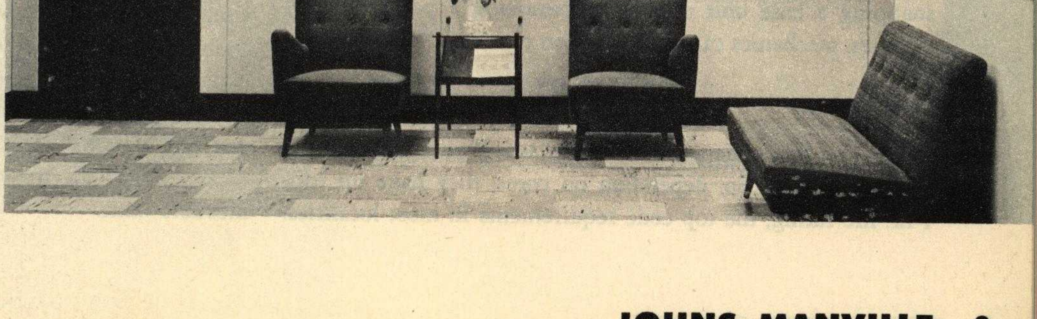
. . for any building requirement



Left—By the simple device of placing the panels horizontally, the architect gave this side of the Imperial partition a different appearance from the other side of the partition where the panels are used vertically. This is one inexpensive way of gaining variation among adjoining rooms. Below—Another possible way for varying room decoration is to use paint or veneers both of which were employed in this room partitioned with Class A Movable Walls. The right side was painted a deep but vivid hue. The intersecting side was given a thin veneer of exotic wood.



Left—In laboratories, industrial or scholastic, asbestos panels assure essential safety and resistance. The entire Imperial Wall assembly can be quickly altered to suit new piping, new equipment or new space arrangements.



Right—The long, floor-to-ceiling Imperial Wall in this lobby for an advertising agency serves as a display space where current work is placed between channels fastened to the wall. (Since this is a flush wall there is no interference for such attachments.) Also, at the right edge of the picture can be seen a section of Imperial Glazed Railing.

Johns-Manville asbestos movable walls

These J-M movable walls are flush surfaced. They have the permanence of fixed walls yet they can be moved; they can be used and re-used without loss. All parts are interchangeable. Any section can be altered without affecting adjacent sections.

Color and pattern unlimited

For custom designs, these walls offer the greatest scope. They can be veneered with wood, leather, cork, metal or plastics. They can be covered with fabrics ranging from burlap to damask. They can be painted any color in the spectrum.

For standard designs, the stock color is a soft green. It is factory applied in a stippled finish that is as decorative as it is durable. And, on order, this finish is available in a wide range of other colors.

Plan and layout versatility

An aptitude for out-of-the-ordinary as well as conventional requirements is an advantage of asbestos movable walls. The solid panels, glazed panels, and door panels are offered in a range of dimensions that fit most situations. But, most important for versatility, the panels can be worked with wood-like ease and speed. Thus, special shapes and odd dimensions are never a problem. Such versatility can be of constant value—in the planning stages, on the job to meet unexpected conditions or sudden changes of mind, and, throughout the life of a building as walls are altered or relocated to satisfy shifting needs.

Quick assembly for early occupancy

J-M Movable walls are erected in a matter of hours compared with the days needed to build fixed walls. This ability to finish fast makes it possible to move in tenants sooner and starts an earlier return on the owner's investment.

Utility accessibility

Wiring and similar lines are easily reached by simply unsnapping a base unit or quickly removing a panel. Within minutes, mechanics can start work on repairs or additions.

Fire safety

All of the Johns-Manville walls are faced with fireproof asbestos materials. So, depending on cores, they have up to a 1-hr. fire rating, the top code requirements in most localities.

Sound control

The standard J-M walls help reduce sound transmission from room to room. Furthermore, the walls can be tailored to meet practically any acoustical requirement.

Prolonged service assured

Throughout years of service, the asbestos materials of these J-M walls stay durable, hard and mar-resistant. Washing and cleaning does not rust them or start other deterioration. The walls can be moved again and again without damage and with 100% re-use value.

Movability minus confusion

Because movable walls are "dry" in construction no dampness or debris are involved. Normal routines can continue as walls are altered or moved. Also, many changes can be completed over night or during a weekend.

Handling and storage

The elements which make up these walls are compact so they can be moved into and out of cramped storage space easily. They can be handled in passenger elevators when a shift means moving from floor to floor. And, when in storage, the few parts involved take up minimum area.

Maintenance made easy

The finish furnished on J-M walls is a tough, hard film many times thicker than the usual partition finish. It is scratch resistant, rejects soil and, if damaged, can be touched up inexpensively to look like new. Maintenance is reduced to a new low.

Responsible installation

J-M asbestos movable walls are sold and installed only by Johns-Manville or J-M Approved Contractors thoroughly trained in proved methods of installation. The services of an experienced J-M engineering staff are available to help with specific problems. Whether the job is large or small, each wall installation receives the benefits of Johns-Manville's long experience in the manufacture, installation and servicing of movable walls.

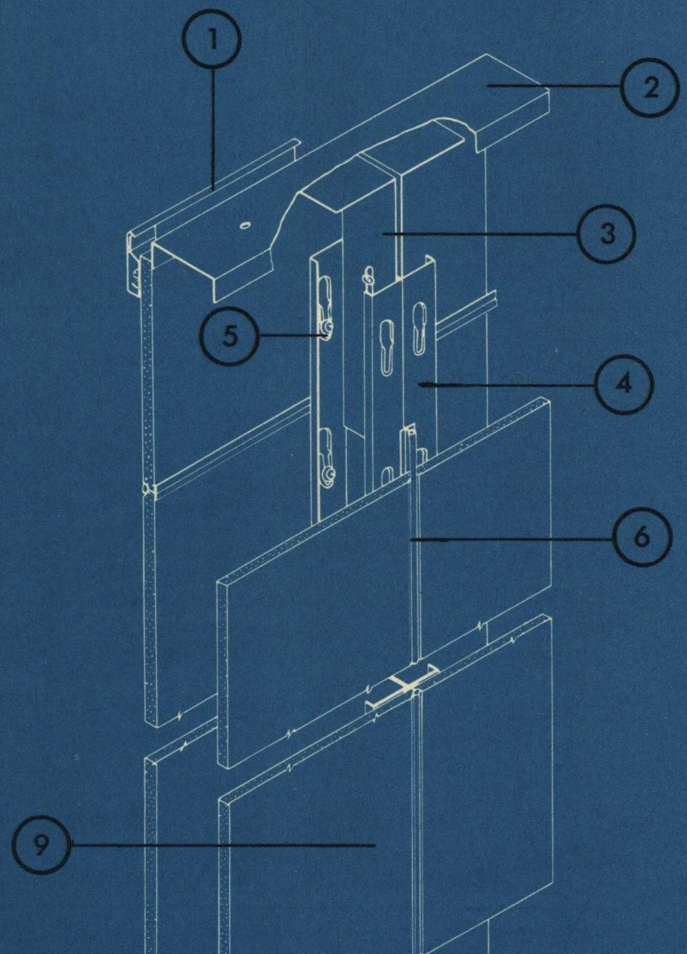
Johns-Manville

Imperial

The basic elements of Imperial Movable Walls are: asbestos panels in 2 types; steel studs with slots; and, a few simple auxiliary pieces. When combined, these elements produce interior walls and partitions that are flush-surfaced and can be finished to have ballroom elegance or can be strictly utilitarian. Imperial walls suit all standard interior plans or they can be adapted easily for one-of-a-kind designs. In all cases they are simple to assemble and can be dis-assembled and relocated within a few hours.

This office could be re-arranged tomorrow in surprisingly few hours, with little confusion and with complete re-use of materials.

IMPERIAL WALL ASSEMBLY



FEATURES

1—**Snap-on moulding**—Furnished in lengths of 10″, this is the standard top member although practically any type of moulding can be used.

2—**Ceiling channel**—Into these the studs are fitted. The channels are furnished in lengths of 10′ and are mechanically fastened to the ceiling.

3—**Stud extensions**—These are short steel units which are inserted in the end of studs to take up any variation in ceiling height.

4—**Studs**—Steel studs have "slots" to receive the "buttons" on the back of the asbestos panels. Stud lengths are in multiples of 6″; the web is 3″; the flanges measure 2½″ with a ⅜″ return.

5—**Buttons**—These patented spring fasteners on the back of the asbestos panels are spaced 18″ on center. The buttons drop into the slots in the studs. As the panel is forced downward, the buttons tighten on the slot edges and the spring holds the panel firmly against the stud. The buttons will take a direct pull of more than 200 lbs.

6—**Joint beads**—These metal beads are fitted between the panels as installation progresses. The flanges of the bead slip between the stud and the edges of the panels. The standard bead is flush with panel surfaces and of a matching color. Beads can be of a contrasting color or of a special design.

7—**Floor channel**—The bottom of the studs fit into these channels which are mechanically fastened to the floor. Channels come in 10′ lengths.

8—**Finish base**—The standard base is 6″ high. Clips along the back of the base panels fasten them securely to the studs. The base is easily removed for access to wiring or other service lines.

9—**Panels**—Johns-Manville offers two types. Both are 7/16″ thick. The panels are beveled on all four face edges unless otherwise specified. They can be supplied in any size up to 4′ wide by 10′ long. However, the 2′ or 4′ widths and the 8′ length are the most generally used.

Marinite panels—Made of asbestos fiber, diatomaceous silica and an inorganic binder, these panels are light in weight yet structurally strong and fireproof. The stock color is light green in a stippled finish. Other colors in the same finish available on order. Unfinished Marinite panels are available for special decoration such as wood veneers, enamel finishes, fabric coverings or wall papering.

Transite panels—Made of asbestos and cement, these fireproof panels are strong, rugged and especially suited for heavy duty installation. The natural color is a light stone gray. No preservative treatment is required although the panels may be painted or otherwise decorated.

Window panels—For borrowed light or visual control, many plans call for glazed units. So, light frames made of hollow steel are stocked by Johns-Manville. The standard height is 42″; standard widths are 20″, 32″ and 44″ for use with 2′, 3′ and 4′ panels. But, the designer is not limited to those sizes since Imperial Walls can be detailed for small window panes or large floor to ceiling glass areas.

Panel erection can be varied—They can be installed either horizontally or vertically. Panels on one side of the wall can be different from the panels on the other side both as to finish and scheme of erection.

Ends, tees, ells and furring—For these locations "channel studs" are used. Lengths are in multiples of 6″; the web is 3″; flanges are 1¼″ with ⅜″ return at the edges. Also, "angle studs" are available. Lengths are in multiples of 6″; both flanges measure 1¼″ but only one flange is slotted. These are used with flat steel plates to make up special shapes to meet unusual job conditions.

Wall heights—Imperial Walls can be built to heights of 20′, 30′, 40′ and even higher if necessary.

Wall thickness and weight—The overall thickness of an Imperial partition is 3⅞″ and the weight is approximately 7 lbs per sq ft.

Doors and hardware—see pages 28-29.

Railings—see pages 26-27.

Bookcases, closets and other special requirements—Bookcases, closets, alcoves, wickets and similar requirements can be built using regular Imperial Wall elements and any fixtures can be screwed into the asbestos panels. Details are drawn up the same as they would be for any builder material.

Suggestions on assembly—Studs are usually spaced on 24″ centers and panels in the 4′ width have "buttons" down the center of the panels. For free standing partitions, when the run exceeds 16′ to 20′ a floor to ceiling brace is required.

Wiring—Utility lines such as wiring can be run anywhere throughout the length and breadth of a wall or partition. Cuts for electrical outlets and other fittings are made on the job since the asbestos panels can be cut as easily as wood. Thus, there is complete freedom of location.

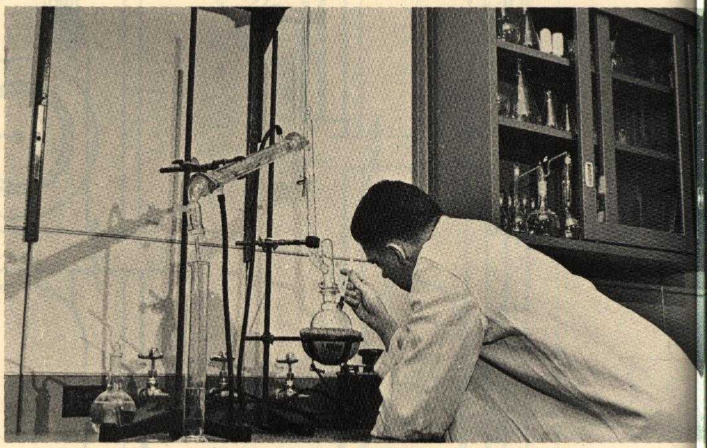
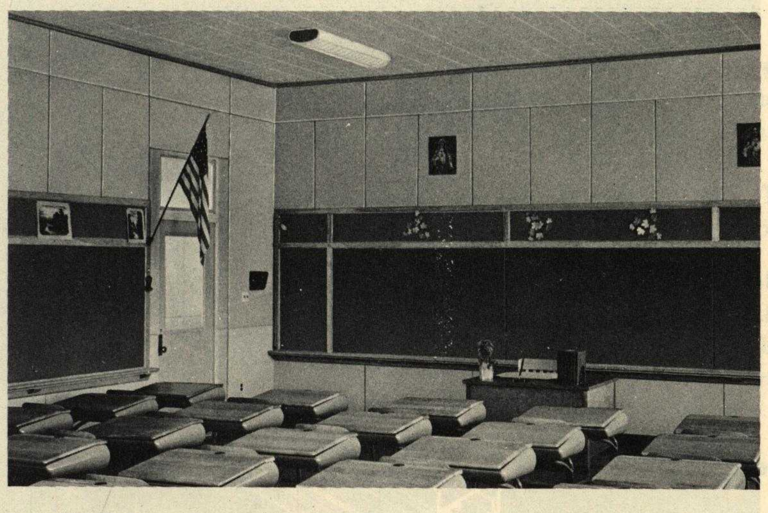
SCHOOL INSTALLATIONS

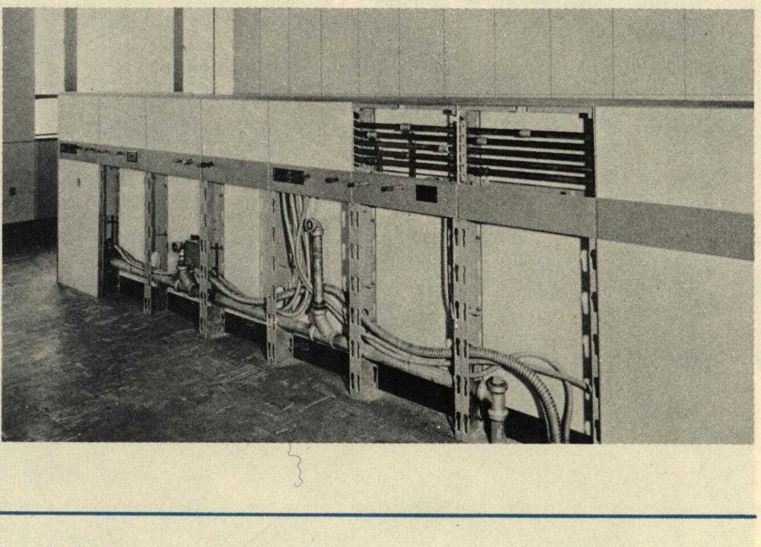
Above and Right—These three photographs indicate how school architects are utilizing the adaptability of Imperial Movable Walls. Not only can the entire wall be relocated with ease but the component panels of the wall can be changed with equal ease. Thus, chalk boards can be replaced by bulletin boards or vice versa and either can be replaced by solid panels, if desired. Also, as shown by the picture directly above, closets and similar requirements can be built into the movable partition.

LABORATORY INSTALLATIONS

Below—The first of these two illustrations shows a laboratory in use. Notice how neatly the hangers for cabinets and working equipment are incorporated into the wall and these can be changed without difficulty when new projects necessitate new devices. The second illustration shows lower panels removed and gives a good view of service lines running within the wall. The quick accessibility of these lines is a decided advantage for repairs or altering these facilities.







SPECIFICATIONS

General: Johns-Manville IMPERIAL ASBESTOS MOVABLE WALLS shall be supplied and erected as shown on drawings. All necessary items such as grounds, framing members, panels, base, doors, hardware and trim shall be included. Details and erection methods shall conform to manufacturer's standards. Units of same dimension shall be interchangeable. The most economical panel arrangement shall be used.

Shop Drawings showing layout, typical elevations and any special conditions shall be submitted in duplicate for approval before proceeding with the work.

Door Hardware shall be manufacturer's standard. (State lock function—i.e., cylinder, latch, etc.) Finish of locksets shall be natural bronze or anodized aluminum. Each door shall have 1½ pair 4½" x 4" flat button tip butts (state finish) and one standard doorstop.

Top Fillers shall be flush panel construction, the same as lower portion of the wall. (Alternate: Shall be ⅜" mineral board on both sides of steel studs and shall extend from the 7'-6" line to the finished ceiling. State if tops are to be spackled, taped and painted by the partition contractor or by others.)

Glass and Glazing: (State if by partition contractor or by others.) Glass shall be (state design, quality, thickness) bedded in putty and back puttied. Color compound to match trim.

Finish: (Imperial Marinite Walls) Shall be applied at the factory. On panels it shall be a textured stipple; on base, black; on doors, bucks and mouldings, it shall be a harmonizing solid color. Colors shall be J-M partition standards as selected by architect. (Alternate: Walls shall be field painted in accordance with partition manufacturer's specifications. State if painting of partition and top filler is to be done by partition contractor or by others.) Colors shall be selected by the architect.

Finish: (Imperial Transite Walls) Walls shall be field painted as outlined in partition manufacturer's painting specifications. Colors shall be selected by architect.

Workmanship: Walls shall be straight and plumb, with horizontal lines level. Hardware shall be carefully adjusted. The finished walls shall be strong, rigid, neat in appearance and free from defects.

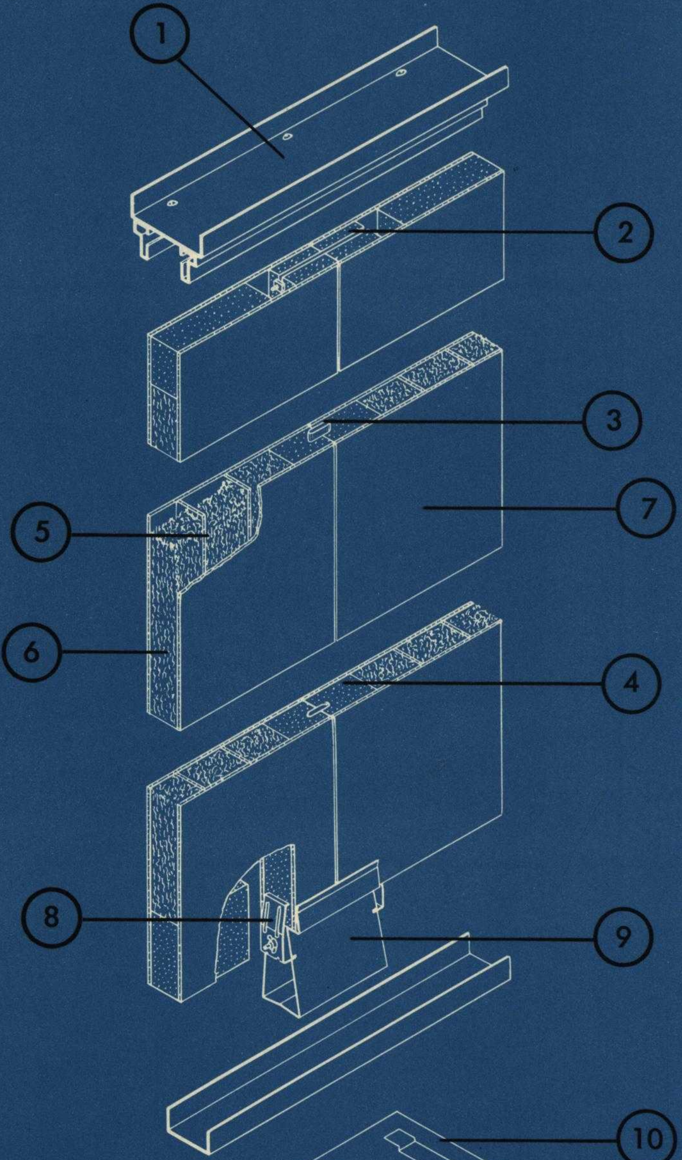
Johns-Manville

Class A

These are moderately priced walls. They are made up of factory-fabricated panels which are erected independently and are completely interchangeable with panels of the same dimension. All of the materials that go into the panels are non-combustible. The overall panel thickness is 1¾″ and the weight is approximately 5 lbs per sq ft.

In this building, Class A Movable Wall panels are combined with filler panels of glass to create a spacious but permanent interior.

CLASS A WALL ASSEMBLY



FEATURES

1—Top stiffening rail—This cornice assembly slips down over each side of the panel providing a trim finish for a free standing partition. However, if desired, the open space from cornice to ceiling can be filled with a section of Class "A" panel, with an asbestos board filler or with glass.

2—Top locking of panels—The panel tops are locked together by carriage bolts. These slip into slots in the top corners of the panels.

3—Splines—The panels are aligned and held together by metal splines 5/16" thick by ¾" wide. These fit into grooves rabbeted into the stiles on each side of a panel.

4—Rails and stiles—These are made of Marinite, a structurally strong but light weight asbestos material developed by Johns-Manville. This fireproof framework is 1½" thick by 2" wide.

5—Reinforcing strips—These are of Asbestos Flexboard, a fireproof asbestos-cement material. The strips are ⅛" thick and run parallel to the long dimension of the panels. The strips are spaced approximately 4" on center.

6—Insulating core—The areas between reinforcing strips are packed solidly with Spintex Insulation, a dense mineral wool material.

7—Facings—On both sides are sheets of Asbestos Flexboard, ⅛" thick. The sheets are beveled along the edges to provide a neat but inconspicuous "V" joint between panels.

Bonding together of elements—Stiles, rails, reinforcing strips, insulating core and asbestos facings are all bonded together under pressure by a moisture resistant adhesive. This results in panels which are strong and rigid yet light in weight.

8—Bottom locking of panels—Through slots at the bottom corners, similar to those at the top, the panels are locked together by clamps and carriage bolts.

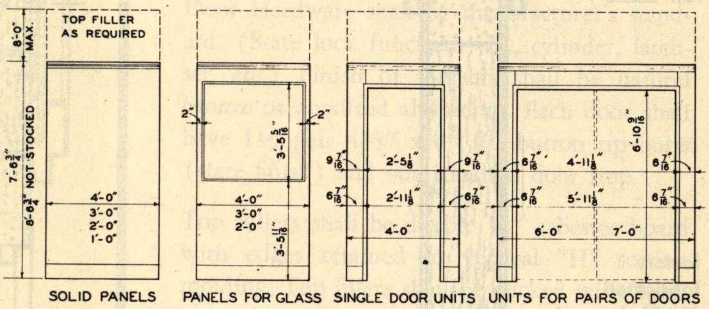
9—Floor supports—A metal support holds the panels 4" off the floor and the spring action of the support secures the panels firmly. The supports fit into a metal channel which is mechanically fastened to the floor.

10—Finish base—An asbestos-cement "clip-on" base 6" high covers the floor channel, metal support and panel bottom.

Factory-applied finish—This is a stippled paint finish that provides a durable film many times thicker than the usual partition finish. It is scratch resistant, rejects stain and soil, can be washed or scrubbed and, if damaged, can be touched up to look like new. The stock color is a soft green. However, a wide range of other colors are available on order.

Field-applied finishes—Class "A" panels also are available in the natural light gray of asbestos-cement materials. These panels can be painted or veneered in any number of ways to meet any architectural requirement.

Panel types and sizes—(others available on order)



Ends, tees and ells—At wall ends and at tees, the panels fit into vertical metal channels. At ells, the panels forming the corner are covered by snap-on metal moldings.

Thru posts—For long wall runs, a floor to ceiling thru post or stiffener should be used every 16′ to 20′.

Top fillers—The space between the top stiffening rail and the ceiling can be filled with glass, with a section of Class "A" panel (pre-fabricated or cut on the job) or with asbestos-cement board.

Wiring—Electrical lines and similar utilities can be strung horizontally behind the removable base. Vertical wireways are provided in the door panels adjacent to each jamb.

Cutting and working on the job—Class "A" panels can be sawed, drilled or shaped in much the same way as wood. Thus, it is a simple matter to produce special sizes right on the job. This workability also makes it easy to build such things as bookcases and closets.

Doors and hardware—see pages 28-29.

Railings—see pages 26-27.

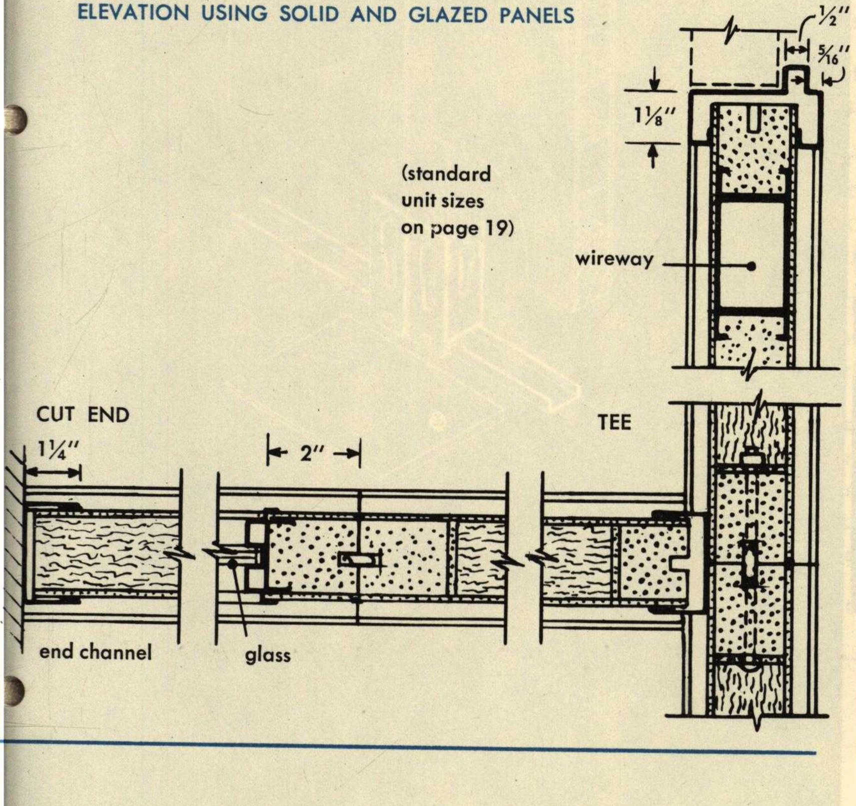
ELEVATION USING SOLID AND GLAZED PANELS



(standard unit sizes on page 19)

SPECIFICATIONS

General: Johns-Manville CLASS A ASBESTOS MOVABLE WALLS shall be supplied and erected complete as shown on drawings. All necessary items such as grounds, panels, base, doors, hardware and trim shall be included. Details and erection methods shall conform to manufacturer's standards. Units of same dimension shall be interchangeable. The most economical panel arrangement shall be used.

Shop Drawings showing layout, typical elevations and any special conditions shall be submitted in duplicate for approval before proceeding with the work.

Door Hardware shall be manufacturer's standard. (State lock function—i.e., cylinder, latchset, etc.) Finish of locksets shall be natural bronze or anodized aluminum. Each door shall have 1½ pair 4½″ x 4″ flat button tip butts (state finish) and one standard door stop.

Top Fillers shall be double ⅛″ asbestos board with edges retained in vertical "H" section molding. Top fillers shall be packed with Spintex mineral wool. (Alternate: Shall be ¼″ mineral board on both sides of 1¼″ x 1¾″ wood studs 2′-0 on centers, secured to partition stiffening rail and to continuous ceiling runner. State if tops are to be spackled, taped and painted by partition contractor or by others.)

Glass and Glazing: (State if by partition contractor or by others.) Glass shall be (state design, quality and thickness) bedded in putty and back puttied. Compound shall be colored to match trim.

Finish shall be applied at the factory. On panels and base it shall be a textured stipple and on bucks, doors, light frames and stiffening rail a harmonizing solid color. Colors shall be J-M partition standards selected by architect. (Alternate: Walls shall be field painted in accordance with partition manufacturer's standard specifications. State if painting of partition and top fillers to be done by partition contractor or by others. Colors shall be as selected by architect.)

Workmanship: Walls shall be straight and plumb, with horizontal lines level. Hardware shall be carefully adjusted. The finished walls shall be strong, rigid, neat in appearance and free from defects.

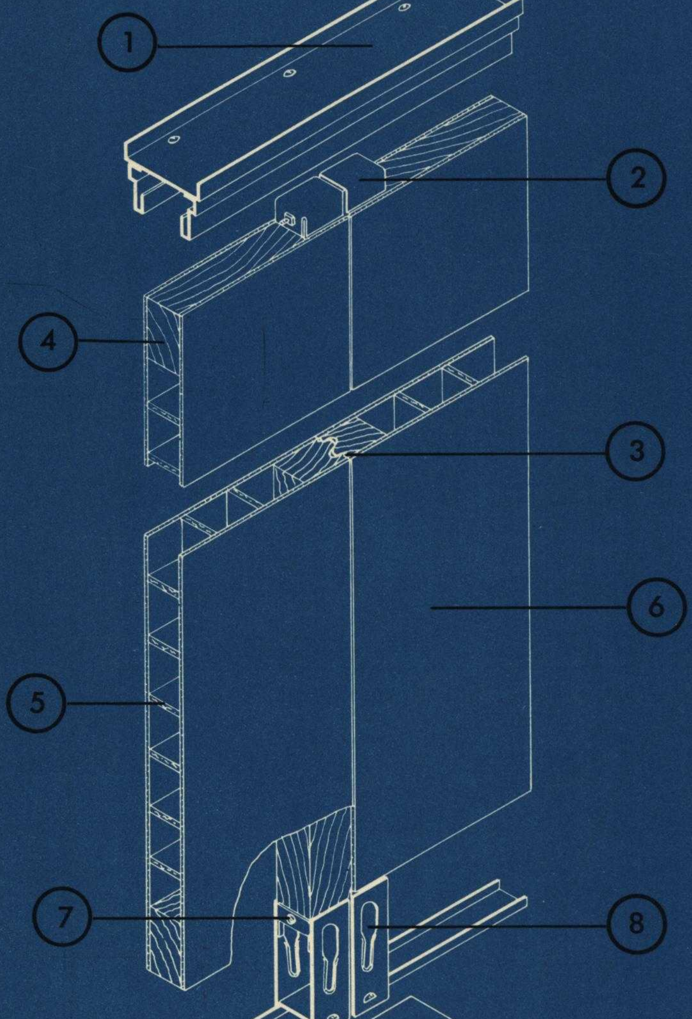
Johns-Manville

Universal

These economically priced walls are of simplified construction. They are one of the easiest of movable partitions to erect or relocate. The panels are erected independently and are interchangeable with panels of the same dimension. The asbestos facings make them highly fire resistant. The overall panel thickness is 1¾″ thick and the weight is approximately 4 lbs per sq ft.

The relatively thin but extremely sturdy Universal Movable Wall panels are ideal for a partition that is carried to a window wall.

UNIVERSAL WALL ASSEMBLY



FEATURES

1—Top stiffening rail—This cornice assembly slips down over each side of the panel providing a trim finish for a free standing partition. However, if desired, the open space from cornice to ceiling can be filled with a section of Universal panel, with an asbestos board filler or with glass.

2—Top locking of panels—Panel tops are locked together by carriage bolts inserted through the top of the stiles which extend 1″ above the top rails.

3—"S" joints—Universal panels are aligned and held together by an "S" milled into the stiles.

4—Rails and stiles—These framing members are made of hardwood 1½″ thick by 2″ wide. Also, there is a cross rail of wood, 1½″ by 2½″, at the center of the panel.

5—Reinforcing strips—The spaces between stiles and rails are filled with interlocking horizontal and vertical strips. These are closely spaced and the strips are of ½″ Johns-Manville Insulating Board, a wood fiber material.

6—Facings—Both sides are faced with sheets of Asbestos Flexboard, ⅛″ thick. These fireproof sheets are beveled along the edges to provide a "V" joint between panels.

Bonding together of elements—Stiles, rails, core and asbestos facings are bonded together under pressure by a moisture resistant adhesive.

7—Bottom locking of panels—Panel bottoms are locked together by carriage bolts inserted through the bottom of the stiles which extend 1″ below the bottom rails and rest in the floor supports.

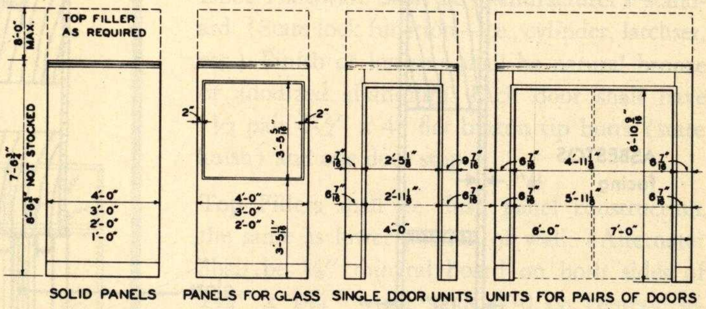
8—Floor supports—A metal support holds the panels 4″ off the floor. They fit over a channel fastened to the floor.

9—Finish base—An asbestos-cement "clip-on" base 6″ high covers the floor channel, metal floor support and panel bottom.

Factory-applied finish—The stock color is a soft green. This is a stippled paint finish that provides a tough, hard, durable film many times thicker than the usual partition finish. It is mar and scratch resistant, rejects stain and soil, can be washed or scrubbed and, if damaged, can be touched up inexpensively to look like new. In addition to the light green, a wide range of other stippled colors are available on order.

Field-applied finishes—Universal panels are available in the natural light gray of asbestos-cement for use without further treatment or, to meet architectural requirements, they can be decorated by painting or veneering in any number of ways.

Panel types and sizes— (others available on order)



Ends, tees and ells—At wall ends and at tees, the panels fit into vertical metal channels. At ells, the panels forming the corners fit into a hardwood post having an "S" milled into two sides.

Thru posts—For long wall runs, a floor to ceiling thru post or stiffener should be used every 16′ to 20′.

Top fillers—The space between the top stiffening rail and the ceiling can be filled with glass, with a section of Universal panel, with a section of Class "A" panel (pre-fabricated or cut on the job) or with asbestos-cement board.

Wiring—Electrical lines and similar utilities can be strung horizontally behind the removable base. Vertical wireways are provided in the door panels adjacent to each jamb.

Cutting and working on the job—Universal panels can be sawed, drilled or shaped in much the same way as wood. Thus, it is a simple matter to produce special sizes right on the job. This workability also makes it easy to build such things as bookcases and closets.

Doors and hardware—see pages 28-29.

Railings—see pages 26-27.

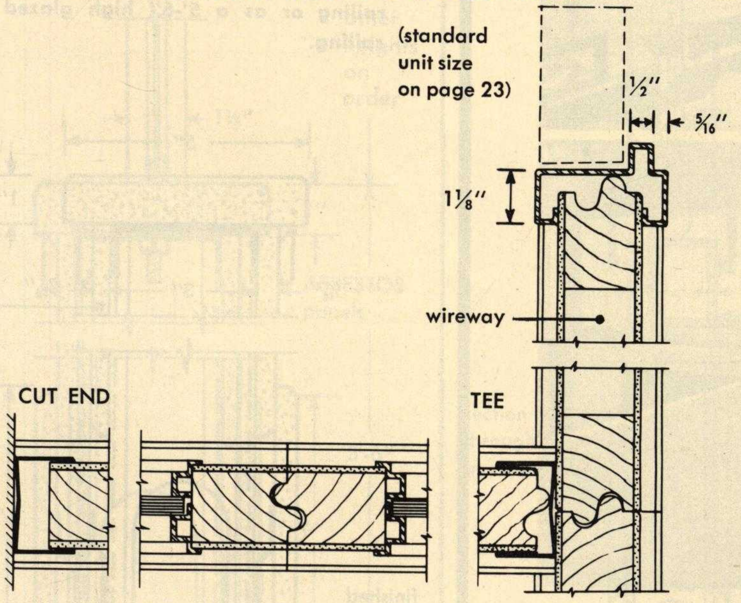
ELEVATION USING SOLID AND GLAZED PANELS



SPECIFICATIONS

General: Johns-Manville UNIVERSAL ASBESTOS MOVABLE WALLS shall be supplied and erected complete as shown on drawings. All necessary items such as grounds, panels, base, doors, hardware and trim shall be included. Details and erection methods shall conform to manufacturer's standards. Units of same dimension shall be interchangeable. The most economical panel arrangement shall be used.

Shop Drawings showing layout, typical elevations and any special conditions shall be submitted in duplicate for approval before proceeding with the work.

Door Hardware shall be manufacturer's standard. (State lock function—i.e., cylinder, latchset, etc.) Finish of locksets shall be natural bronze or anodized aluminum. Each door shall have 1½ pair 4½″ x 4″ flat button tip butts (state finish) and one door stop.

Top Fillers shall be flush panel construction, the same as lower portion of wall. (Alternate: Shall be ¼″ mineral board on both sides of 1¼″ x 1¾″ wood studs 2′-0 on centers, secured to partition stiffening rail and to continuous ceiling runner. State if tops are to be spackled, taped and painted by partition contractor or by others.)

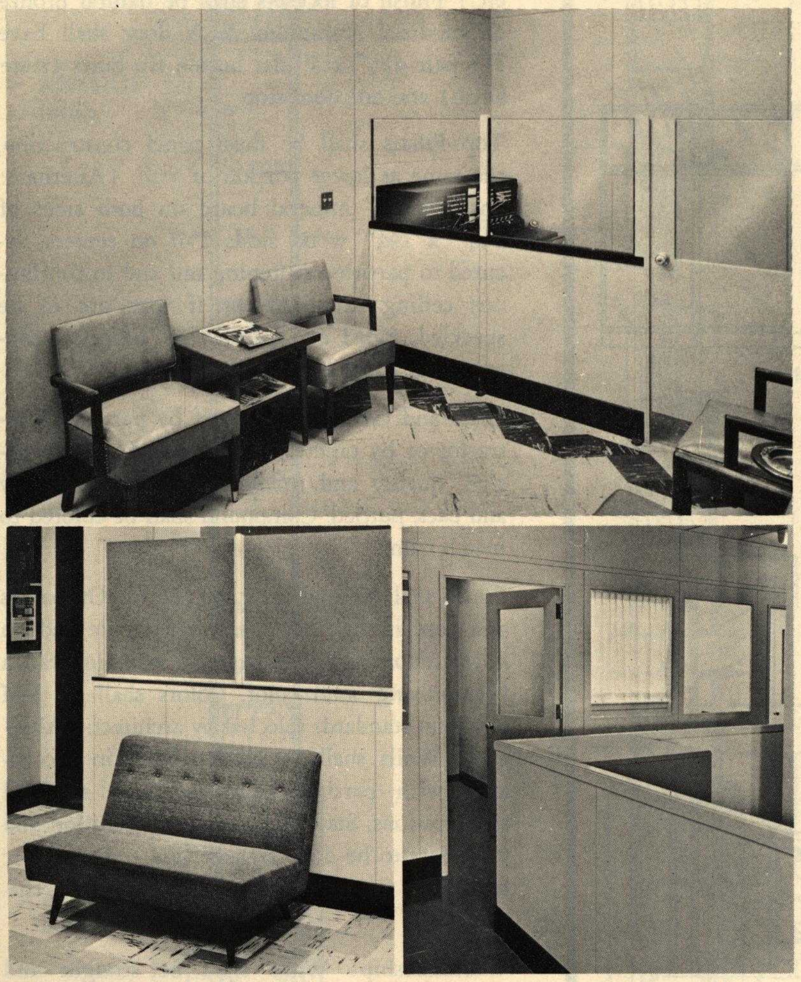
Glass and Glazing: (State if by partition contractor or by others.) Glass shall be (state design, quality and thickness) bedded in putty and back puttied. Compound shall be colored to match trim.

Finish shall be applied at the factory. On panels and base it shall be a textured stipple and on bucks, doors, light frames and stiffening rail a harmonizing solid color. Colors shall be J-M partition standards selected by architect. (Alternate: Walls shall be field painted in accordance with partition manufacturer's standard specifications. State if painting of partition and top fillers to be done by partition contractor or by others. Colors shall be as selected by architect.)

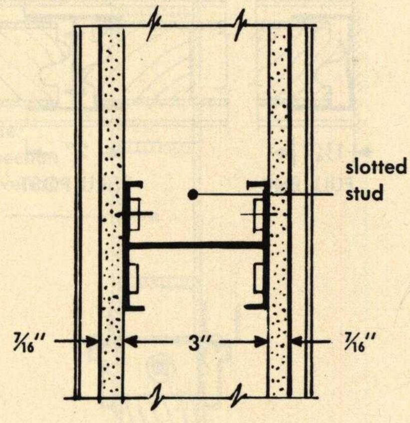
Workmanship: Walls shall be straight and plumb, with horizontal lines level. Hardware shall be carefully adjusted. The finished walls shall be strong, rigid, neat in appearance and free from defects.

Johns-Manville Railings

Johns-Manville Movable Railings, like the movable walls, are made up of interchangeable parts which can be erected, dismantled and re-located with the complete salvage of materials. Two types of railings are available—the Imperial and the Universal. Either type can be employed with any of the J-M Movable Walls.



Glazed railings with clear glass, glazed railings with frosted glass for greater privacy and a railing for simple separation are illustrated by the three pictures above. These can be utilized in many ways and in combination with many types of walls and partitions to satisfy the need for sub-dividing working areas.



SOLID SECTION AT JOINT

IMPERIAL RAILINGS: These are assembled using a 3" slotted stud, the same as for Imperial Walls and the finishes offered are also the same. They are available as a 3'-6" high railing or as a 5'-6" high glazed railing.

UNIVERSAL RAILINGS: These are 1¾″ thick, the same as Universal Walls and Class A walls. The finishes offered also are the same as for the walls. They are available as a 3′-6″ high railing or as a 5′-6″ high glazed railing.

Johns-Manville

Doors and Hardware

Both full flush doors and V-type flush doors are used with either Imperial, Class A or Universal Movable Walls. They can be solid or glazed; with or without louvers. They are furnished with a baked enamel finish or with a prime finish for decorating on the job. Also, J-M Movable Walls are so adaptable that any other type of door can be installed successfully.

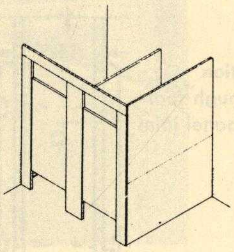
Johns-Manville

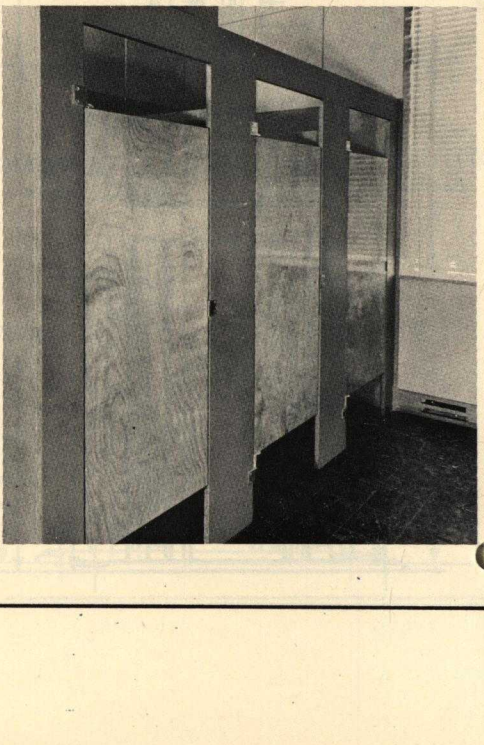
Toilet Compartments

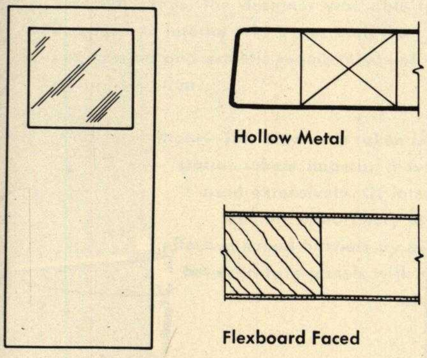
Johns-Manville Toilet Compartments are built of solid, 1" thick, asbestos-cement panels. They are strong, sanitary and easy to maintain. They will not burn, rot or rust. The standard finish is a natural gray for field painting or the panels can be factory waxed. Modifications of standard designs are easily made to meet special needs.

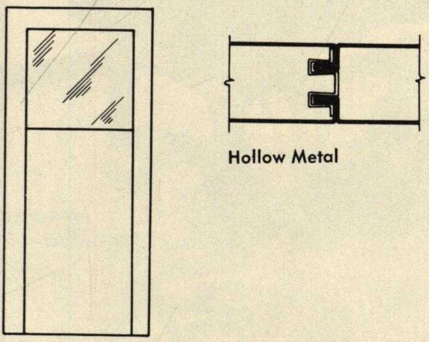
HEAD RAIL

Head rail type compartments are exceptionally stable to withstand severe abuse.



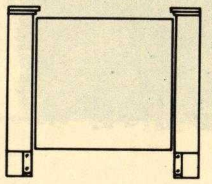


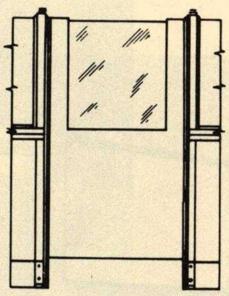




GATES FOR RAILINGS

For both the Imperial Railings and Universal Railings, Johns-Manville furnishes low gates and high gates (for glazed railings) as indicated above. The nominal width is 3'-0". The gates are of wood with either a painted or stained finish. Also, hollow metal gates are available.





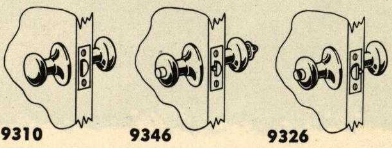
STANDARD HARDWARE
Locksets

9310 Latch Set operates by knob either side. No locking device.

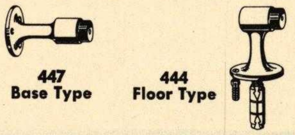
9346 Cylinder Lock operates by knob from inside and key from outside at all times. Push button on inside deadlocks outside knob. Turning inside knob releases push button. Deadlocking latch.

9326 Single Communicating operates by knob either side. Turn button locks or unlocks outside knob. Deadlocking latch.

9328 Double Communicating same as above except turn button in each knob locks or unlocks opposite knob.



Door Stops Cast bronze



Door closers

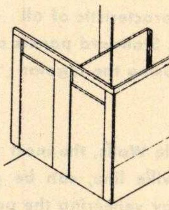
B-1 and C-1 Series—with or without hold-open feature. Closers are surface applied to door and frame. Can be used with all stock doors and stock frames.

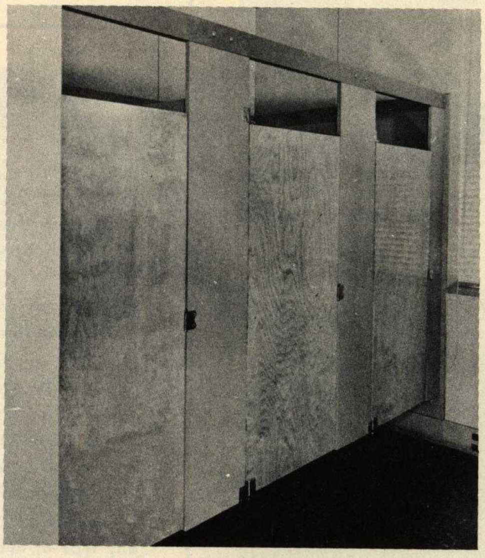
3000 Series—with or without hold-open feature. Closer is concealed in the door. The arm is surface applied to the frame. Closer can be used with all stock door frames but requires non-stock doors.

Other types of door closers require non-stock door frames as well as non-stock doors.

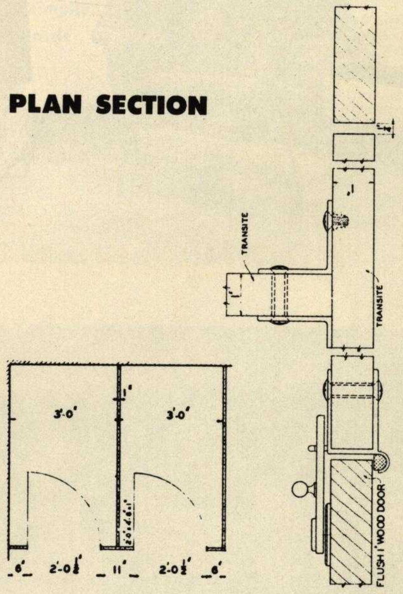
SUSPENDED

Suspended type compartments provide an open floor area for easier cleaning.





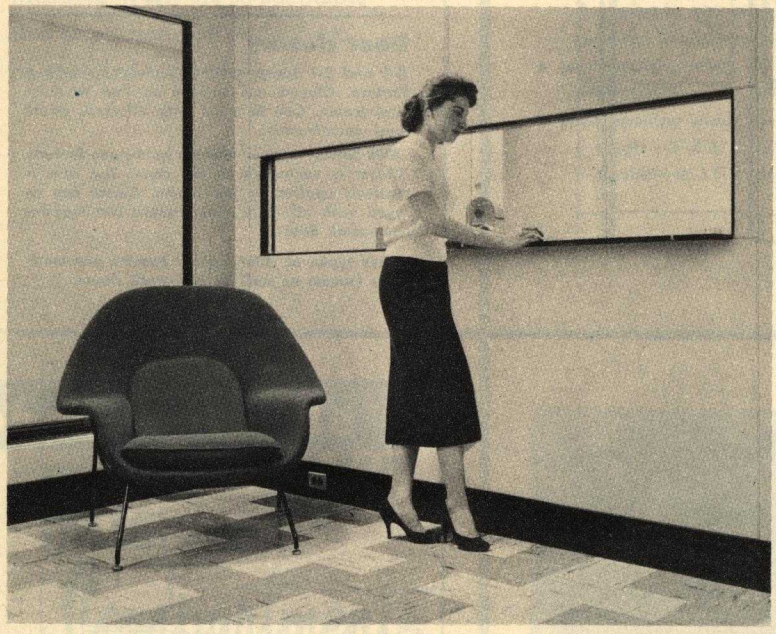
PLAN SECTION

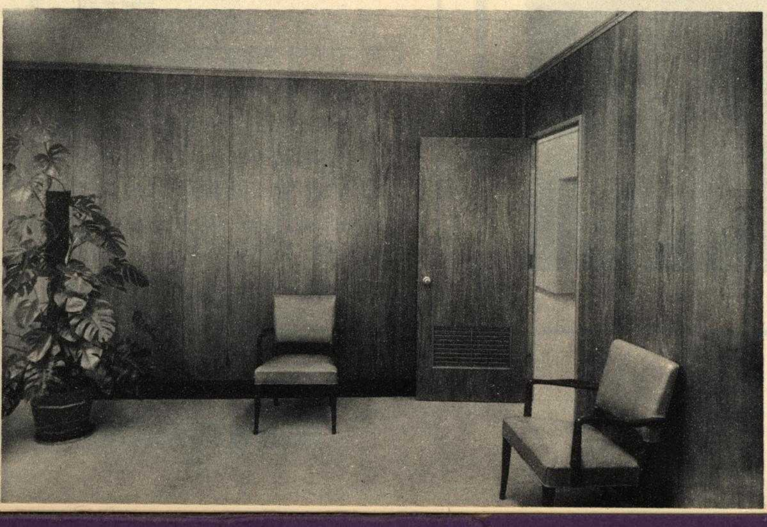


JOHNS-MANVILLE
JM
PRODUCTS

other interiors

These pictures further illustrate the versatility of Imperial, Class A and Universal Movable Walls. They are at home in most any type of building; fit the unusual lay-out as well as the straight wall plan; can be simple in appearance or decorated luxuriantly; and, can be counted on to give years of service.



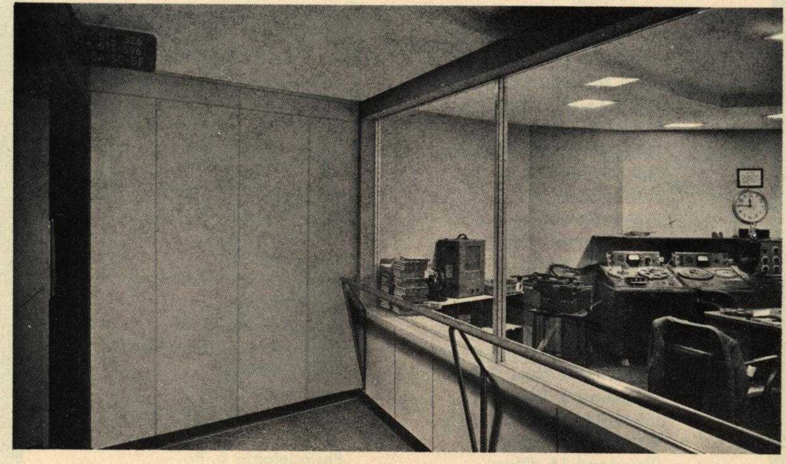


Top Left—The pass-through opening shown here was fashioned right on the job by the mechanics who erected the Class A Movable Walls in this office. Easy workability of this sort is a characteristic of all Johns-Manville Movable Walls. Standard panels can be quickly and accurately cut using the regular tools of the trade.

Bottom Left—Universal Movable Walls, the most economical of the Johns-Manville line, can be given a highly expensive appearance by veneering the panels with wood as was done for this interior. Such individualized treatment is a unique advantage of asbestos walls. They are amenable to almost any type of decoration.

Left—The splayed walls of this recording studio were built with Imperial Movable Walls because the components allow latitude of assembly. Thus, the designer was able to compose an interior which met both the engineering and esthetic requirements of this special situation.

Right—This view was taken in a broadcasting station where Imperial Movable Walls were used extensively. Of interest in this case, was the opportunity to make the walls effective sound barriers by packing the space between face panels with sound absorbing mineral wool pads.



Left—This office is typical of thousands of business interiors where Class A Movable Walls can be used to provide sturdy, non-combustible, moderately priced partitioning that can be shifted with minimum bother when new arrangements are needed.

Below—As seen in this picture, Johns-Manville movable walls are "healthy" walls for hospitals and for the suites of doctors, dentists or therapeutists. The flush surface of the walls simplifies maintenance of high sanitation standards.

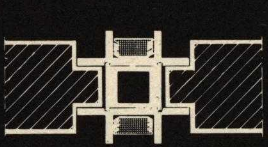
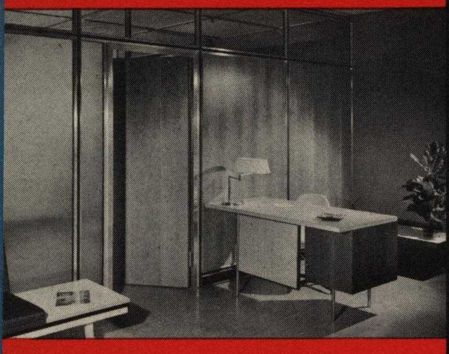
RESEARCH and DEVELOPMENT

Since its organization in 1921, The Mills Company has continually researched and developed new and better methods of interior space control to meet the changing needs of modern business and progressive architectural concepts. While developing new partitions, Mills is always able to supply additions or replacements for former installations. Results of finish performance tests and sound transmission tests are listed on Page 4.



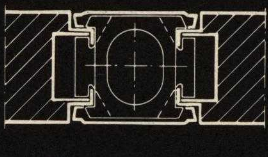


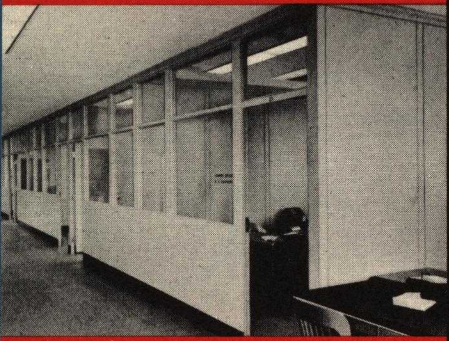
b

PAGES
5-7

ALUMINUM FRAME PARTITIONS

A new concept that offers a handsome method of space division, yet is completely interchangeable to facilitate layout changes. Satin finish aluminum frames, and striking vinyl trim offset a wide choice of insert panels with simplicity and fine taste. Unique $2\frac{1}{2}''$ wide universal posts (Pat. pending) receive $\frac{15}{16}''$ or $2\frac{1}{8}''$ thick panels, and allow for future extensions without post replacement.



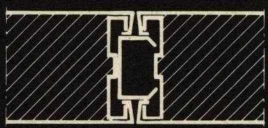


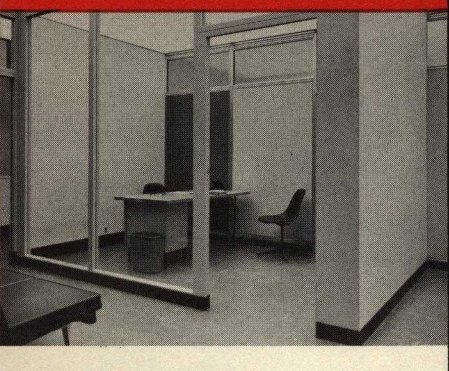
c

PAGES
8-11

FLUSH PILASTER PARTITIONS

Widely used in office buildings, industrial offices, hospitals, universities and laboratories as ceiling high or cornice high partition units, wall linings and railings. Excellent sound retardant qualities (See Page 4). Panels, 3″ thick, comprised of two sheets of steel welded to a steel frame. Panels packed with fiberglas. Post caps flush with panels. Continuous base without plinth blocks. Universal post. Built-in utility spaces.





d

PAGES
12-14

SINGLINE PARTITIONS

A new development of partition research offering great value and economy for any partition use. Combination leveling device and double-cam interlock assures tight, straight joints. Versatile spline assures sturdy installation, ease of erection, simplicity in relocation. Flush panels 3″ thick of two steel sheets packed with Fiberglas. Post for glazed units $2\frac{1}{2}''$ wide. Built-in utility areas. All parts reusable.

Catalog 60-OP

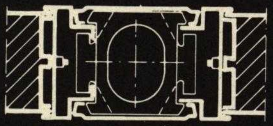
the mills company

TO FLEXIBLE SPACE CONTROL

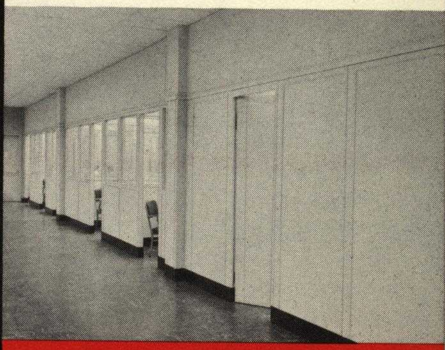
EXECUTIVE PARTITIONS

Used in general office and public buildings, schools, laboratories and factories. They adequately retard sound transmission. Furnished as cornice high with or without top filler to ceiling. Panels 2¾″ thick comprised of two sheets of steel with insulating honeycomb core, whole incased in a steel frame. Universal posts 3″ thick. Continuous base without plinth blocks. Built-in utility spaces. Panels may be cut in field.



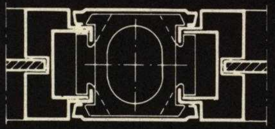
PAGES
15-17

e



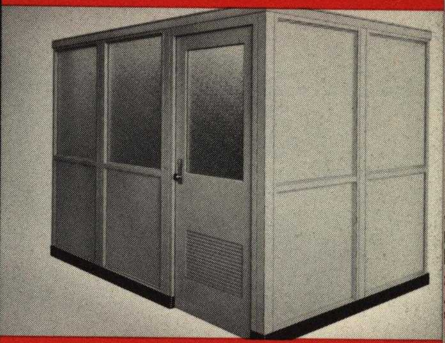
UNIVERSAL PARTITIONS

An economical partition for general and private offices, interviewing and examining rooms, industrial offices and work areas. Incorporates many details found only in top-line partitions. Panels ⅜″ thick comprised of two steel sheets, insulated with inorganic filler, mounted in steel frame. Universal posts 3″ thick. Continuous base without obstruction of plinths. Built-in utility spaces. Field cut down possible.



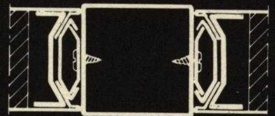
PAGES
18, 19

f



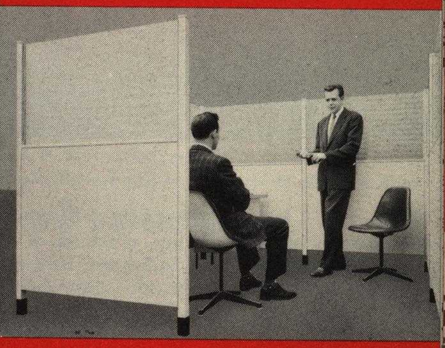
MAINLINER PARTITIONS

New free-standing partitions for economical space division. Easy to install and move. Made in four heights and ten panel widths. Metal bottom panels at 42″ height with 6″ open space at floor; glass or glass and steel above to nominal height. Panels are 1½″ thick comprised of two steel sheets with insulating honeycomb core. Universal posts, 1¾″ square, have buttons which engage spring locking device. Micro-adjustable floor leveler.



PAGES
20, 21

g



COMMERCIAL PARTITIONS

Used to define departments, for offices for production personnel, to create stock rooms and tool cribs. Glass lites approximately 20″ wide, 3″ square universal posts. Single steel and steel and glass panels. Cornice optional where partitions extend to ceiling. Combinations of steel, glass and wire mesh panels can be made to produce walls 30 feet or more in height. Built-in utility spaces.

a RESEARCH & DEVELOPMENT PERFORMANCE SPECIFICATIONS

research and development

Within the past year Mills Research has completed development of four new partition systems to keep pace with advancement in architectural design requirements. Mills Research has developed, during the past 37 years, complete prefabricated building interiors, which eliminate the need for time-consuming plaster or other interior finishes. Complementing Mills partitions, Mills wall linings, window embrasures and convector enclosures provide space for ducts, pipes, heating units, conduits, etc., affording quick access to all utilities. Mills experience covers every phase of space control in all types of buildings, including special partitions and cubicles for schools, laboratories and hospitals, also fire resistant partitions which exceed 60 minutes under A.S.T.M. conditions. All Mills partitions provide adequate wiring facilities, and proper fittings are supplied as specified. Mills partitions have four times the thermal insulating qualities of a clay tile wall, plastered both sides.

accessories and special products

A partial list of accessories and products to meet special conditions encountered in completion of many building interiors:

finish performance tests

To insure uniform high quality, Mills finishes are subjected to the following tests:

ADHESION—Shall adhere tightly to the substrate over which it is applied, whether bare steel, primer or when recoating. When applied to 20-gauge steel, it shall withstand 20-inch pounds impact and shall show no loss of adhesion bent over a ½″ mandrel. When scratched with a knife, it shall show fine bevelled edges.

ACID TEST—Immersion in the following acids for the time stated, without etching, blistering, cracking or loss of color. (Slight loss of gloss permissible.) 50% sulphuric acid—4 hours, 2% oxalic acid—8 hours, 5% hydrochrolic acid—4 hours, 5% nitric acid—1 hour.

ALKALI TEST—Shall withstand immersion in the following alkalies: There shall be no loss of color, etching, cracking, blistering; (slight loss of gloss permissible). 50% sodium hydroxide—1 hour, 28% household ammonia—16 hours, 5% trisodium phosphate—16 hours.

NON-POLISHING—Shall withstand 250 cycles on a Gardiner Abrasion and Washability Machine, using abrasion boat and cheesecloth over a felt pad. There shall be no increase in gloss as measured with a Gardiner 60 Glossmeter.

HARDNESS—Shall withstand 500 gm. load of a Hoffman hardness tester.

HUMIDITY TEST—Shall withstand 500 hours exposure in atmosphere with 100% humidity and temperature of 100°F., with no breakdown in film.

WATER SOAK TEST—Shall withstand 500 hours immersion in distilled water at 95°F., with no breakdown in film.

DRY ABRASION—Shall withstand 600 cycles per mil of finish on a Gardiner Abrasion and Washability Machine using abrasion boat and No. 220 sandpaper over a felt pad.

sound control

SOUNDPROOFING—Standard Mills Flush Pilaster partitions are sound resistant to control ordinary noise problems. Where conditions require added sound control, areas are enclosed with specially soundproofed partitions. Mills Flush Pilaster Partitions have a sound reduction of 30 db to 36 db, which is more than a tile and plaster wall twice as thick. For best soundproofing results they should have a minimum number of doors and glazed units. Glazed units should have hermetically sealed double lites. Standard door frames are rubber lined and should have automatic felt drops or continuous wipers with thresholds. Follow specifications on Page 11 for maximum soundproofing.

SOUND TRANSMISSION LOSS— Below is shown sound transmission loss of Mills Flush Pilaster Partitions determined by Riverbank Acoustical Laboratory, Armour Research Foundation.

Type Partition	Transmission Loss
All steel to ceiling, no doors, completely packed	42db
All steel to ceiling, no doors, no packing	36db
All steel to ceiling, with doors and felt drops	32db
All steel to ceiling, with doors no felt drops	30db

(Glazed partitions have slightly less transmission loss.)

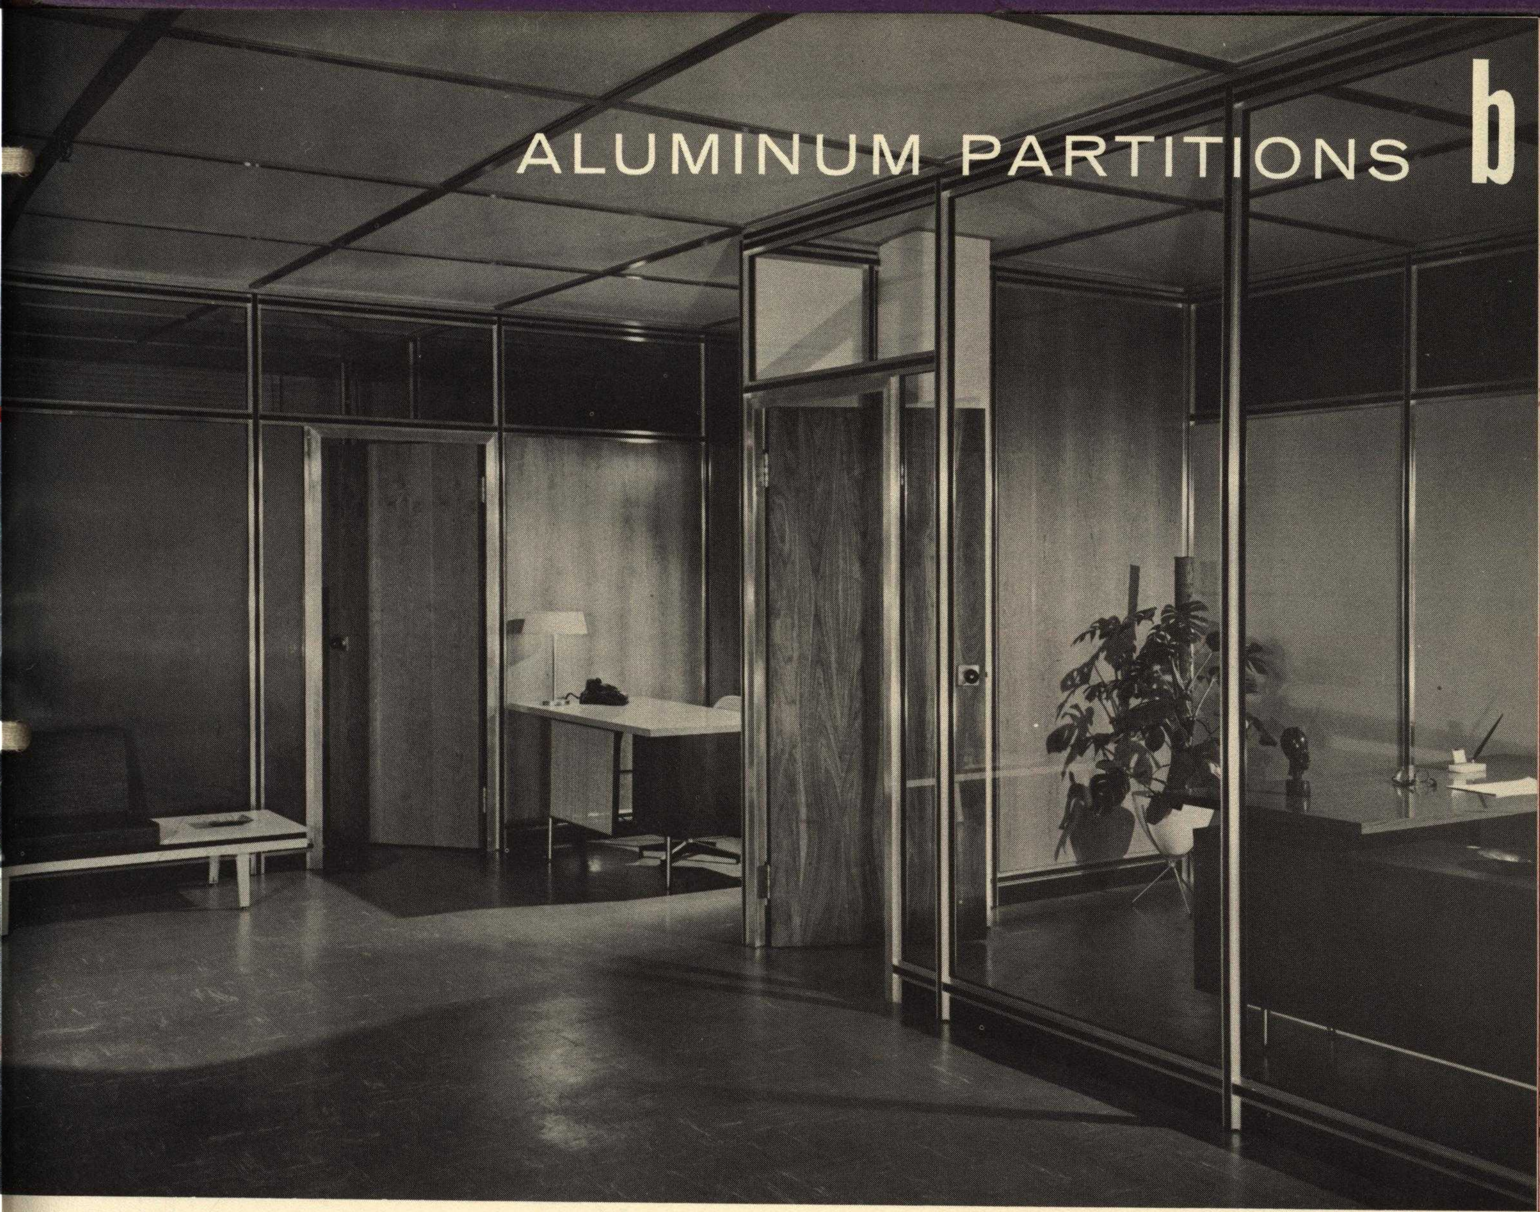
The average of four actual tests for Mills Flush Pilaster all steel partitions to ceiling with fillers, posts, base and cornice packed with Fiberglas are:

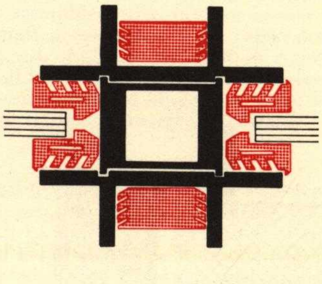
Frequency Cycles	128	256	512	1024	2048	4096	Average Rating
Test Average	25	34	38	49	56	51	42.1db

SOUND ABSORPTION—Mills Acoustic Partitions are for sound control rooms where a high degree of sound absorption is necessary. These partitions are desirable only where the treated wall area is equal or more than the ceiling area. They are made of perforated panel units, whose interiors are packed with sound absorbing material. One or both sides of the panel units may be perforated.

SOUND TRAVEL—Normally, suspended ceilings are ineffective as a sound barrier. Consequently, when a series of soundproofed offices are planned under such a ceiling, the chances of sound travel over the partitions should be considered. Baffles should be installed tightly above each run of partition, from the suspended ceiling to the bottom of the slab to eliminate cracks through which sound can easily pass. Lighting fixtures, heating outlets, etc., should also be baffled. Louvers cannot be fully soundproofed.

ALUMINUM PARTITIONS b





the new shape of space

Working with leading architectural consultants and the Aluminum Company of America, The Mills Company has recently completed three years of design and research toward the development of a new idea in modern partition systems.

Designed by architects to meet the needs of architects these handsome Mills satin-finished aluminum partitions create an expression of delicate linear definition, classic simplicity, fine taste and a feeling of spaciousness, resulting from exclusive Mills design and construction features.

Unique universal aluminum posts (patents pending) are completely interchangeable to facilitate layout changes. Panels and framing members are available in modules up to six feet in width and in heights to a maximum of ten feet. Verticals and horizontals may be accented with colorful vinyl inserts. Horizontal members may be placed at any desired height and fit snugly into the universal posts. Panel-to-post tolerance problems are virtually eliminated by this exclusive, interlocking design. Posts are recessed to receive the tongued insert-panels.

Within this thoroughly interchangeable system of partitions an unlimited selection of panels and panel finishes may be employed, offering the designer complete flexibility in the development of custom installations. For a detailed brochure explaining the full advantages of this new system, write The Mills Company, 965 Wayside Road, Cleveland 10, Ohio.

specifications

TYPE—Furnish and erect complete The Mills Company Standard Aluminum Partitions.

SHOP DRAWINGS—Detailed shop drawings shall be submitted to the architect in triplicate. Fabrication shall begin after architect's final approval of shop drawings, which shall include: partition plans, typical elevations, door and hardware schedule, color and/or finish of panel inserts, aluminum extrusions and hardware; and details of special conditions not otherwise indicated in plans.

TYPE OF PARTITION—Shall be of skeletal type: aluminum structural frame with applied insert panels. All panels shall interchange with other panels or door units of similar size, design and construction without disturbing adjacent runs of partition.

PARTITION FRAME

Aluminum—All partition frame sections shall be No. 6063-T5 Aluminum alloy extruded sections. Aluminum extrusions shall have a caustic etch and 20-minute standard clear anodizing treatment. Colored anodizing available to architect's specifications, when desired, at additional cost. All aluminum shall be properly alloyed, tempered and free from harmful defects.

Module—Standard modular unit widths of partition shall be 48″ center line to center line of posts; but building module shall govern unit widths for each job. (Post-to-post spans in excess of 72″ not recommended). Heights of vertical panel subdivisions shall be at discretion of designer.

Posts—Shall be of three-piece construction (design and mechanical patents pending), consisting of hollow rectangular central post and two applied identical pi-shaped sections, assembled with countersunk self-tapping screws, screws to be concealed by inlaid vinyl trim. Outer post sections to be removable from either side for glazing and installing panels. Final post assembly shall be symmetrical, with recesses allowing for 2-, 3- or 4-way extension of panels or glazing units without disturbing adjacent panels or substituting, rearranging or disfiguring material in place.

Horizontal Rails—Shall be of same general design and assembly as vertical posts. Horizontal rails shall occur at base line, at top of door frame and at ceiling or at other points as selected.

Ceiling Channel—Shall be black anodized aluminum extrusion, allowing for adjustment to compensate for ceilings out of level. Ceiling channel shall be securely fastened to suspended ceiling.

Wall Channel—Shall be clear anodized hat-shaped aluminum extrusion, allowing for adjustment to compensate for fixed walls out of plumb. Wall channel shall fit tightly against fixed wall or column with inorganic seal.

Door Frame—Shall be hollow aluminum extrusion, mitered at top corners of door and securely assembled with interior corner brace at top corners. Frame recess shall accomodate 1¾″ thick door. Continuous strike at head and jamb shall be rabbeted to receive black vinyl gasket. Door jambs shall have hinge mortise and strike mortise milled out at factory, and factory installed hinge and strike reinforcements, all properly drilled and tapped to receive hardware.

PANELS

Steel Panels—Steel panels shall be 15/16″ or 2⅛″ thick (specify which). 15/16″ panels shall be flush with interior faces of post recess. 2⅛″ panels shall have 15/16″ tongues at all panel ends to fit into post recess. All panels of like unit widths and heights shall be interchangeable.

Steel panels shall be constructed of two 20 gauge steel sheets secured on perimeter to steel interlocking channel member by means of toggles to make rigid fastening. Sheets to be reinforced with 20 gauge horizontal "hat-shaped" stiffeners spot welded on 3″ centers. Stiffeners shall be mounted on 12″ centers in the vertical height of the sheet. Spaces between sheets shall be packed solid with inorganic filler for sound attenuation and to give backing to sheets.

When specified, steel panel sheets shall be perforated on one or both sides for added sound absorption.

Steel Finish—Steel panels shall be thoroughly cleaned in a phosphate solution, rinsed with a rust inhibitor and properly dried before paint is applied. Panels shall be permanently finished with an enamel prime and finish coat of alkyd-melamine base, properly baked to ensure durable quality, meeting finish performance specifications on page four. The finish coat shall be of a uniform "eggshell" texture; color shall be Mills' Color No. . . . or color to be as selected. Grained finishes for steel panels shall match approved samples. Finish shall consist of a prime coat and a finish coat of alkyd-melamine base, baked on and sanded smooth, after which graining ink shall be applied and baked. A baked-on varnish coat of "eggshell" gloss shall then be applied to preserve grained finish.

Wood Panels—Wood veneer panels are to be 15/16″ or 2⅛″ thick, as specified. 15/16″ panels shall have solid core of pressed, glued wood chip construction, with exposed face of veneer as selected. 2⅛″ thick panels shall have cellular hollow core faced on both sides with 7/16″ 3-ply panels. Face panels shall have ⅜″ pressed wood core with veneer of wood selected. 2⅛″ thick panels shall have solid lumber frame, and all panel ends shall be constructed with a 15/16″ thick tongue to be received into vertical and horizontal aluminum members. Samples of panel wood veneers shall be submitted for approval. Architect or designer to designate if veneer is to be book matched, slip matched or random selected.

Wood Panel Finish—Wood veneer panels shall be clean, dry and sanded to smoothness when finish is applied. They shall be prefinished before shipment with sealer coat and one sprayed coat of clear, hot lacquer, all sanded to satin smoothness. Paint manufacturer's specifications shall govern time allowed between coats.

Glazed Panels & Glazing— Glass and plastic panels shall be furnished by partition contractor of design and quality as specified or called for on drawings. Standard glazing mold shall be black vinyl to accomodate any 7/32″ or ¼″ glass panel, or other panel material of similar thickness. Black vinyl mold shall be of width and thickness to fit universally into recesses on all sides of posts or horizontal rails.

End Filler Panels—End fillers shall be used at the termination of partition runs at fixed walls or columns. Steel end fillers shall be similar in design and construction to 15/16″ steel partition panels and shall be finished in a similar manner. Wood end fillers shall be similar to 15/16″wood partition panels. End fillers shall fit neatly and snugly into extruded clear anodized wall channel.

Door Sidelight Panels—In instances where the established panel module from center to center of post is 48″ or wider, a door sidelight panel may be used. This panel may be of any type as hereinbefore specified.

DOORS

Steel Doors—Shall be 1¾″ thick with 3/32″ clearance at jambs and heads. They shall be of flush steel design or with glass lights as specified. Stiles shall be flush, 5″ wide, fabricated of 18 gauge steel, with No. 20 gauge panels, which shall be sound-deadened. All doors shall be properly mortised and reinforced for hinges, locks and Mills 904 concealed door check. (Hinge reinforcement: 14 gauge pressed steel channel; lock reinforcement: 16 gauge; check reinforcement: 14 gauge). Door shall be approximately 2′-10″ x 6′-10″. Glass shall be secured without the use of screws.

Wood Doors—Shall be flush, 1¾″ thick with solid lumber core, finished in veneer of type selected. Standard wood door shall be aproximately 2′-10″ x 6′-10″. Edges shall be beveled and all mortises cut at factory for hardware. Finish specifications for wood doors shall be same as that for wood panels.

HARDWARE—Doors shall be provided with Mills' standard LW 5400 series tubular latch and locksets in Alumilite finish with black anodized knobs. Doors shall be hung with one pair of Mills standard BB179 ballbearing butt hinges in U.S. 26D finish. Other hardware shall be Mills standard.

ELECTRICAL PROVISIONS—Switches, where required, shall be mounted on posts. Duplex outlets, when specified, will be mounted in factory-punched cutouts in the electrical base. Hollow central post extrusion shall have provisions for vertical fish wiring.

All switches, switch plates, duplex convenience outlets and flush plates shall be provided for by partition contractor at locations indicated on plans. All wiring, conduit and connections shall be by others.

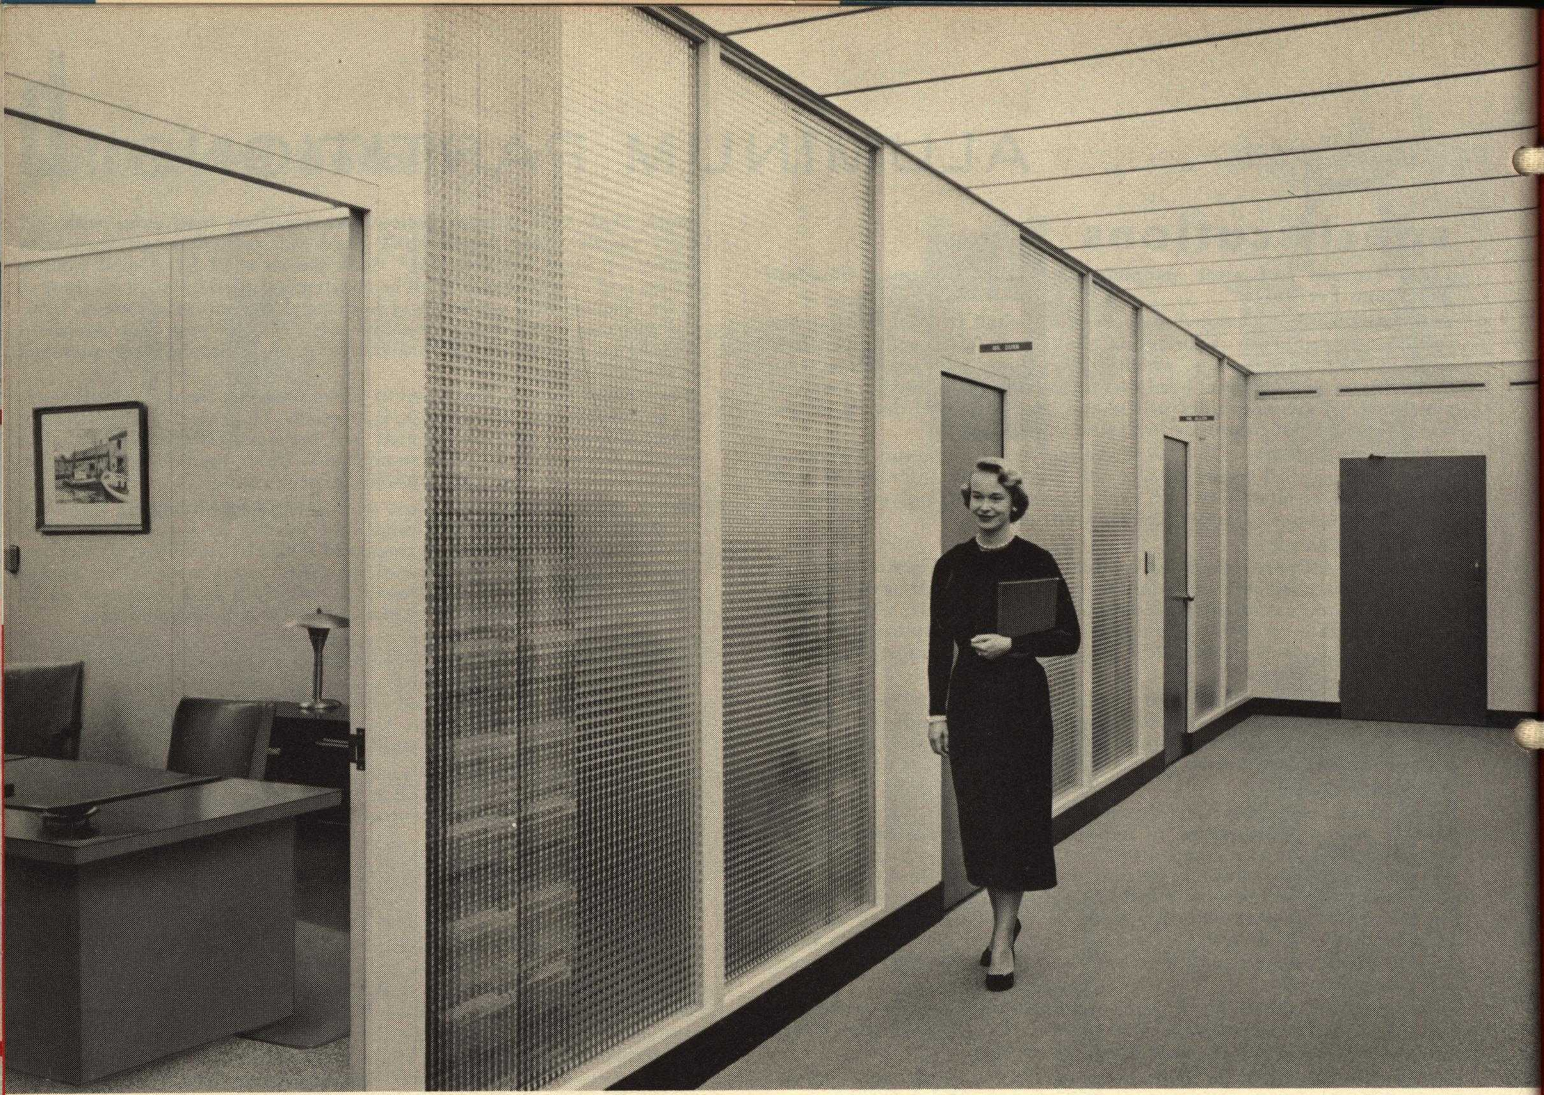
FLOOR AND CEILING CONNECTIONS—The post shall be anchored to the floor with telescopic anodized aluminum fitting, mounted with non-corrosive inserts and screws, permitting positive adjustment by means of "post contoured" floor shims. Inner post section shall interlock with continuous aluminum channel at ceiling by means of post extension.

BASE

Standard—Shall be removable, approximately 3¼″ high, formed of black rubber, reinforced with concealed steel channel. It shall fill space between bottom rail and floor, held in contact with floor by concealed springs. Base shall provide adjustment for variations in floor level. **Electrical**—(Optional at extra cost). Shall be approximately 3⅞″ high, formed of 18 gauge steel held in alignment by inner floor channel. Finished base section shall be 1¾″ thick. It shall fit below bottom rail and run continuous between door frames, or sectionally between posts. Base shall be adjustable for floor height variations and shall be removable from both sides for ready access to utility space.

ERECTION—Partitions shall be assembled and erected in a workmanlike manner, mounted over finished flooring. Joints between framing units shall be perfectly membered and close fitting, with vertical lines plumb and horizontal lines level. Hardware shall be thoroughly adjusted and in proper working condition.

CLEANING—All rubbish and cartons shall be removed and the job left broom clean. All minor defects and blemishes in panel finish shall be touched up neatly and fingermarks removed. Cleaning of glass, erection dust and washing are considered maintenance work to be done by others.



State Mutual Life Assurance Company of America, Worcester, Mass. Hoyle, Doran & Berry, Architects.

MILLS *Flush Pilaster* PARTITIONS

Widely chosen for use in complete building interiors, including partitions, railings and wainscot. Furnished either in all steel or steel and glass panels, three inches thick.

Numbers indicated below refer to corresponding details on facing page.

ALL WELDED FLUSH PANELS

All units fabricated in widths of six inch increments, not exceeding 48″ in all steel panels and 60″ in steel and glass panels.

1. Panel units are all welded, the sturdiest construction possible for a movable wall.
2. 3″ thick batts of fiberglass will not settle.
3. Stiffeners, located 12″ on center, spot-welded 3″ on center.
4. Vertical channel, spot-welded 8″ on center.
5. Formed channel shoe.
6. Furniture stock panel sheet, thoroughly cleaned, filled and sanded.

PATENTED FLOOR LEVELING DEVICE

7. Plated micro-adjustable floor levelaer securely attached to floor under each post; makes adjustments to compensate for floor irregularities easy.

BOX GIRDER POST CLIPS

8. Plated tension and compression clips assure solid, strong connections and accurate spacing of panels. May be placed at any convenient height.

STURDY CEILING CONNECTIONS

9. Ceiling high partitions telescope into one-piece ceiling channel. (Cornice-high partitions are also available.)

SELF-SEATING GLASS MOULD

10. Intergral, self-seating glass mold ensures positive stop on glass at all times. Glass panels have mortise and tenon joints at transom rails and top rails.

UNIVERSAL POST

$2\frac{3}{8}$″ space between panels, covered by post cap removable from either side. Designed to make possible future extensions of either two, three or four-way intersections without removing adjoining units.

ADJUSTABLE DOOR FRAMES

Made as a complete unit, factory welded and finished. Frames are adjustable at each jamb to compensate for normal floor irregularities and still provide architectural lines that are truly horizontal and vertical. Since there is no cutting in the field, frames may be taken down and moved to a new location with all parts reusable. Frames have a continuous rubber lining at jambs and head.

specifications

TYPE—Furnish and erect complete The Mills Company Standard Flush Pilaster Movable Steel Partition.

SHOP DRAWINGS—Detail shop drawings indicating plan, elevation, hardware, finish, special conditions and construction shall be submitted to the architect for approval before actual fabrication is started.

UNITS—The partitions are to be 3″ thick, built in a standard cornice height of either 7′4″, 8′4″, 9′2″ or 10′0½″ to the top of the cornice trim as indicated. All units are to be shipped from the factory in one assembly from floor to cornice in widths of 6″ increments not to exceed 48″ in all steel and 60″ in steel and glass. All are to be interchangeable. All 42″ wide panels will interchange with 42″ door sections. Units shall be so assembled that future extensions of either 2–, 3–, or 4-way may be joined together without removing the adjacent units or material above the cornice line.

STEEL—All exposed steel shall be cold rolled, commercial quality furniture stock, properly annealed, process-leveled for smooth, clean surfaces. Gauges specified are United States Standard.

PANELS—Shall be flush with the face of post caps and shall be made of two sheets of No. 20 gauge furniture stock, spot-welded around entire perimeter to a steel frame. The sheets proper shall be reinforced with horizontal stiffeners spot-welded on 3″ centers and these stiffeners shall appear approximately every 12″ in the height of a sheet.

The space between the panel sheets shall be packed solid with an inorganic filler for further sound attenuation and backing to the sheets.

Glass openings to be provided in the upper portions of panels for either single glass or hermetically sealed double glass units as indicated in elevation. Top rails and transom rails of steel and glass panels shall be tenoned into mortises in side molds and spot-welded in place, forming a direct interlocking rigid joint.

DOORS AND FRAMES—Doors shall be 1¾″ thick with $\frac{3}{32}$″ clearance at jambs and heads. They shall be made of flush design with 5″ wide stiles flush with door panels, which shall be sound deadened. All doors to be reinforced for hinges, locks and door checks. (Hinge reinforcement 14 gauge pressed steel channel, lock reinforcement 16 gauge, check reinforcement 14 gauge.) The standard swing door with frame shall fit a 42″ wide section and the door shall be approximately 3′ by 7′. Glass mouldings to be secured without the use of screws. Frames shall be full adjustable type to compensate for varying floor levels and different floor coverings. Proper frame height shall be attained by telescoping head, with jambs being leveled independently for uneven floors by means of internal channels anchored securely to floor maintaining horizontal top lines and glass lines throughout the installation. Frames shall have continuous rubber gasket at head and jambs.

HARDWARE—Shall be interchangeable as to operation so called for in hardware schedule.

Doors shall be provided with two 5″ x 4″ loose pin ball bearing butt hinges.

BASE—Shall be No. 20 gauge, 4″ high with ¼″ projection. Shall be flat, sanitary design and run continuous along both sides of the partition without the obstruction of plinth blocks at the pilasters. Base to be vertically adjustable for normal irregularities in floor elevations. Base shall be removable from either side to provide ready access to utility spaces.

CEILING TRIM—(For partitions that extend to the ceiling.) Shall be made to run continuous over the top of all units to provide rigidity for horizontal bracing and provide a utility space.

CORNICE—(For partitions that do not extend to the ceiling.) Shall be made to run continuous over top of all units. Cornice to be No. 18 gauge rolled steel section providing maximum rigidity for horizontal bracing and also providing ample utility space.

WALL FILLERS—Shall be No. 18 gauge and telescopically adjustable. They shall have packed insulation of inorganic filler. There shall be no exposed raw steel edges or wall fastenings.

FLUSH PILASTER CAPS—Shall be No. 18 gauge rolled shape of flat ornamental inlay design. The surface of same to be flush with face of panels. Caps shall be removable for disassembly and wiring.

FLOOR CONNECTIONS—Shall be concealed by the base and fit below each post. They shall be securely fastened to the floor. They shall also be provided with plated vertical threaded studs and leveling wheels to permit fine adjustment to normal floor irregularities.

PANEL CONNECTIONS—The panels and door units proper are to be connected by means of plated No. 11 gauge compression and tension clips that properly align and hold units rigid. The clips are to be provided with a wiring hole to permit vertical wiring and shall also be provided with projections for "snapping on" flush pilaster post cap that is held in place without the use of screws, bolts, nuts, etc. These clips are to be designed to permit their application at any point in the height of the unit.

TOP FILLER—(Omit if no top filler required). Mineral board top fillers for partitions that extend to ceiling shall be applied over studs set 24″ on center. Top filler shall be double sheet mineral board ⅜″ thick. Joints to be buttered, finished smooth and covered with perforated tape to make joints invisible and prevent cracking. It shall be painted to match ceiling by partition contractor.

Steel top filler of No. 20 gauge for partitions that extend to the ceiling shall be double steel with single flush line joints. Top filler shall be removable.

FINISH—All partitions shall be thoroughly cleaned in a phosphate solution, rinsed with a rust-inhibitor and properly dried before paint is applied. Partitions are to be permanently finished with an enamel prime and finish coat of alkyd-melamine base and properly baked to ensure durable quality, meeting performance specifications as published on page 4. The finish coat shall be of a uniform "eggshell" texture; color shall be Mills Color No . . . . . or color to be as selected. *Specify color of base or doors if different from partition color.*

Grained finishes are to match approved samples. Finish shall consist of a prime coat and one finish coat of alkyd-melamine base, baked on and sanded smooth, after which a coat of graining ink shall be applied and baked. This shall be followed by a baked on clear varnish top coat of "eggshell" gloss.

GLASS AND GLAZING—(Omit if no glass required). Glass for metal partitions shall be furnished by partition contractor of design, quality and thickness as specified or called for on drawings. Glass shall be set with aluminum glazing strips. Glazing molds shall be an integral part of glass frame. They shall be self-seating and insure a positive stop on glass at all times. Loose glazing stops and exposed screws shall not be used.

SOUNDPROOFING SPECIFICATIONS—*Standard Flush Pilaster Partition has an average sound transmission loss of 36 db. If maximum soundproofing is required, partition runs should be indicated on plans as "soundproof" (See page 4) and the following specifications added:*

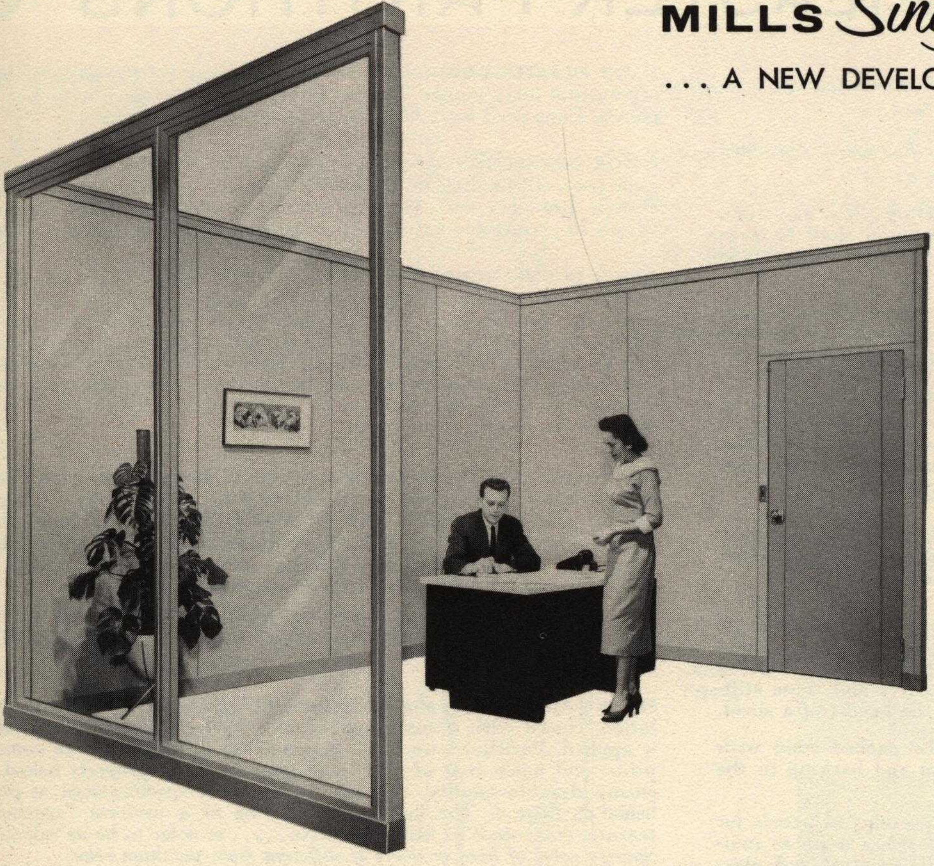
SOUNDPROOFING—Partition post connections, base and cornice and wall fillers shall be solidly packed with glass wool during erection of partitions. Point of contact of partition base with floor shall be sealed with felt which shall make continuous contact with the floor and with the base. Top filler (if any) shall be solidly packed with glass wool for its full height. Glazed partition runs shall be glazed with hermetically sealed double glass panels or separate lite of glass set approximately 2″ apart in felt with removable frame to permit easy cleaning of glass at any time. Hermetically sealed double glass panels shall have all four edges of the double glass lites well sealed with putty to prevent sound leakage around glass. Automatic felt drops shall be furnished at each door and door frames shall be lined with rubber.

ERECTION—Partitions shall be erected in a rigid manner, straight and plumb, with horizontal lines level. Units shall be aligned at all panel and door unit joints. Hardware shall be thoroughly adjusted and left in good working condition. Provide reinforcements to ceiling or bracing on runs exceeding 20′ in length unsupported by cross runs.

CLEANING—All rubbish and cartons shall be removed and the job left broom clean. All minor defects and blemishes shall be touched up neatly and finger marks removed. Cleaning of glass, erection dust and washing are considered maintenance work to be done by others.

MILLS *Singline* PARTITIONS

. . . A NEW DEVELOPMENT OF PARTITION RESEARCH



POINTS FOR COMPARISON

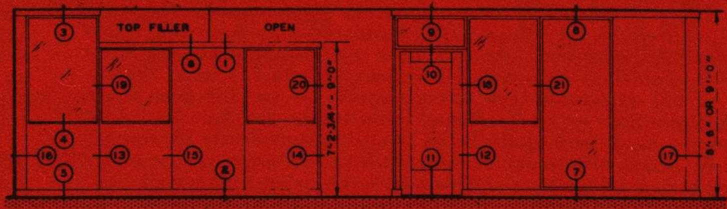
- Low initial cost—multiple savings in use.
- Full three inch thick partitions, flush aligned.
- Fiberglass—packed panels.
- For steel and glass panels—slender 2 ½″ posts, crisply profiled.
- Rugged panel interlock — assuring sturdy installation and allowing jacknife panel interchange without disturbing whole runs of partition.
- Ease of erection—simplicity in relocation—complete salvageability.
- Built-in wiring facilities and provisions for standard-sized electrical components.
- Double-cam interlocking floor shoe, assuring panel alignment and tight joints.
- Permanent, baked enamel finish.

STANDARD HEIGHTS

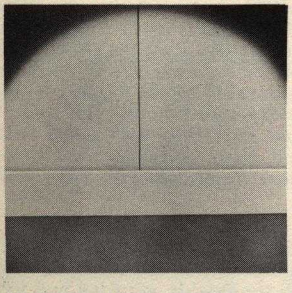
Ceiling High Partitions:	8′6″ & 9′0″
Cornice High Partitions:	7′2¾″ & 9′0″
Top Filler Over Cornice:	(If Required) Varies, Min. 6″

STANDARD WIDTHS

All Steel Panels:	6″ to 48″ on 6″ multiples
Steel & Glass Panels:	12″ to 60″ on 6″ multiples
Door Sections:	42″
Doors:	36″

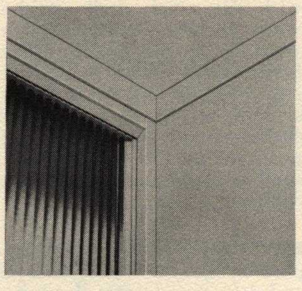


TYPICAL ELEVATIONS – SINGLINE PARTITIONS



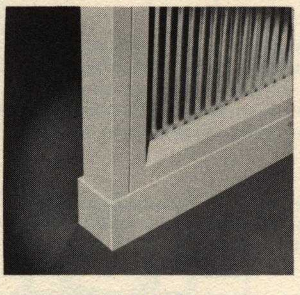
SINGLINE PANEL JOINTS

All panels abut with a single tight joint, from base to cornice, whether panels are all steel, steel-and-glass or full-height glass.



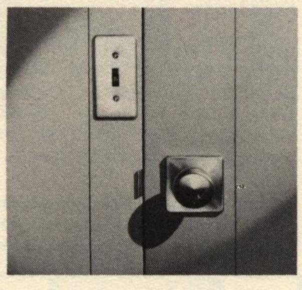
SIMPLE CEILING TRIM

2 ¼″ ceiling trim on floor-to-ceiling partitions allows for tight fit to ceiling. Panel-to-ceiling interlock assures straight partition runs.



STRAIGHT-LINE BASE

Adjustable for uneven floors, base is 4″ high, continuous, and wraps around finished ends. Utility space inside base allows for quick installation of wiring.



ADJUSTABLE DOOR FRAME

Variations in floor or floor covering heights are easily compensated for with adjustable door frame. Frame permits through floor-to-ceiling wiring.

SINGLINE PARTITIONS

specifications

TYPE—Furnish and erect complete The Mills Company standard Singline Movable Steel Partition.

SHOP DRAWINGS—Detailed shop drawings, indicating plans, elevations, hardware finish, special conditions and construction shall be submitted to the architect; fabrication shall begin after approval by the architect.

MOVABILITY—Partitions shall be designed to quickly accomodate any change in layout after original installation with economy and ease and without debris. All partitions and parts shall be 100% reusable.

UNITS—The partitions are to be 3″ thick, built in standard cornice heights of 7′ 2¾″ or 9′ 0″ or ceiling heights of 8′ 6″ or 9′ 0″. All units are to be shipped from the factory in one assembly from floor to cornice in widths of 6″ increments, not to exceed 48″ in all steel and 60″ in steel and glass. All 42″ wide panels will interchange with 42″ door sections and all panels shall interchange with other panels of like size.

STEEL—All exposed steel shall be cold rolled, commercial quality furniture stock, properly annealed, process-leveled for smooth, clean surfaces. Gauges specified are United States Standard.

PANELS—All-steel panels shall be flush, 3″ thick, factory assembled. Space between panel sheets shall be packed with glass wool for sound control and backing to the sheets. Panel sheet vertical ends shall be formed to butt adjacent panels with a single line joint. Inner faces of panel sheets shall have horizontal stiffeners, spot welded on 3″ centers, appearing every 12″ in the height of the sheet.

Glass openings to be provided in the upper portions of panels as indicated in elevation. All-glass partitions shall be glazed full height within a steel panel frame. Vertical glazing posts shall be No. 20 gauge steel with edges formed to butt adjacent panels same as all-steel. Top rails and transom rails of steel-and-glass panels shall be tenoned into mortises in side molds and spot-welded in place, forming a direct interlocking joint.

WALL FILLERS—Wall fillers shall be used for termination of partition runs at a fixed wall or column. They shall be double steel sheets fabricated to give a finished appearance similar to partition panels and shall be telescopically adjustable into sealed wall channel and packed with glass wool.

TOP FILLERS—Top fillers shall be used to close the space between the cornice and the ceiling for cornice high partitions.

Mineral board top filler, when specified, shall be double sheets, ⅜″ thick applied over studs set 24″ on center. Joints to be buttered, finished smooth and covered with perforated tape to make joints invisible and prevent cracking. Fillers shall be painted to match ceiling by partition contractor.

POSTS—Each panel inner vertical channel shall run continuous the full height of the panel and shall wedge tightly with double cam interlock into 11 gauge floor saddle. Floor saddle to be levelled with shims to adjust for normal floor irregularities. Fastenings at top and bottom of panel connections shall assure a tight joint.

An inner spline of 18-gauge steel shall run the full height of the partition at each panel intersection. For ceiling high partitions, an extension of the inner post alignment shall be adjustable to ceiling variances.

DOORS AND FRAMES—Doors shall be 1¾″ thick with 3/32″ clearance at jambs and heads. They shall be made of flush design and shall be packed with glass wool. All doors to be mortised for hardware and reinforced as follows: For hinges: 14 gauge pressed steel channels; for locks: 16 gauge reinforcement; for checks: 14 gauge reinforcement. The standard swing door with frame shall fit a 42″ wide section and the door shall be approximately 3′ x 7′. Glass mouldings to be secured without the use of screws. Frames shall be full adjustable type to compensate for varying floor levels.

HARDWARE—Shall be Mills standard Singline hardware, and shall be interchangeable as to operation. Doors shall be provided with two 5″ x 4″ butt hinges.

BASE—Shall be No. 20 gauge, 4″ high with ¼″ projection, shall be flat, sanitary design and run continuous along both sides of the partition without the obstruction of plinth blocks at panel joints. Base to be vertically adjustable for normal irregularities in floor elevations. Base shall be removable from either side to provide ready access to utility spaces.

CORNICE—(For partitions that do not extend to ceiling). Shall be made to run continuous over top of all units. Cornice to be rolled steel section providing maximum rigidity for horizontal bracing and also providing ample utility space. Cornice shall be securely fastened at each panel vertical.

CEILING TRIM—(For partitions that extend to ceiling). Shall be made to run continuous over the top of all units to provide rigidity for horizontal bracing and provide a utility space.

RECESSED BASE AND CORNICE—(Available when specified at extra cost) Base and cornice shall be recessed ½″ on either side. Base shall be No. 20 gauge, 4″ high of flat, sanitary design. It shall run continuous along both sides of partition without obstruction of plinth blocks at panel joints. Base to be vertically adjustable for normal irregularities in floor elevations and shall be removable from either side to provide ready access to utility spaces. When desired, 2½″ high recessed cornice shall be furnished.

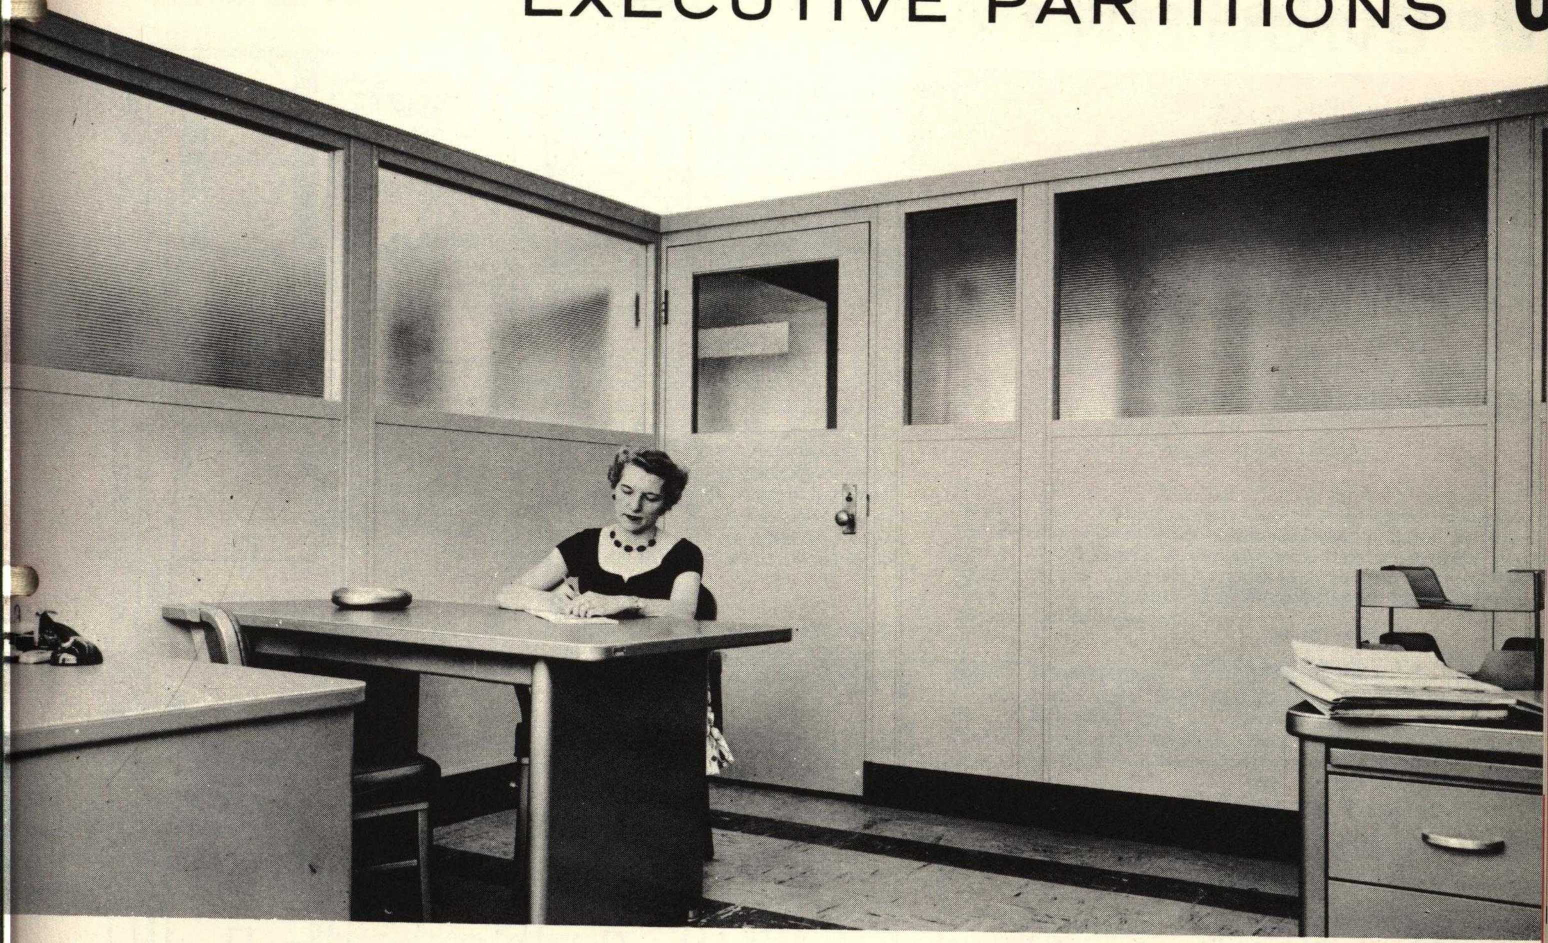
FINISH—All partitions shall be thoroughly cleaned in a phosphate solution, rinsed with a rust-inhibitor and properly dried before paint is applied. A permanent, durable finish shall be applied to all partitions. The finish coat shall be of a uniform "eggshell" texture; color shall be Mills Color No.....or color to be as selected. *Specify color of base or doors if different from partition color.*

If desired, partitions may be furnished in prime coat, final finish to be applied by others after erection of partitions.

GLASS AND GLAZING—(Omit if no glass required). Glass for metal partitions shall be furnished by partition contractor of design, quality and thickness as specified or called for on drawings. Glass shall be set with aluminum glazing strips. Glazing molds shall be an integral part of glass frame. They shall be self-seating and insure a positive stop on glass at all times. Loose glazing stops and exposed screws shall not be used.

ERECTION—Partitions shall be erected in a rigid manner, straight and plumb, with horizontal lines levelled. Units shall be aligned at all panels and door unit joints. Hardware shall be thoroughly adjusted and left in good working condition. Reinforcements or bracing shall be provided floor to ceiling on runs exceeding 20 feet in length, unsupported by cross runs.

CLEANING—All rubbish and cartons shall be removed and the job left broom clean. All minor defects and blemishes shall be touched up neatly and fingermarks removed. Cleaning of glass, erection dust and washing are considered maintenance work to be done by others.



MILLS *Executive* PARTITIONS

Possessing most of the construction advantages of flush pilaster partitions. Executive Partitions have 2 ¾″ thick panels, with steel facing sheets, permanently bonded to an insulating honeycomb core and encased within a steel frame. The 4″ base is continuous, without obstruction of plinth blocks; panels may be cut down, if required, in the field.

In thermal insulation quality, load bearing capacity, finish, and lightproofing and dustproofing characteristics, Mills Executive Partitions are substantially the same as Mills Flush Pilaster Partitions. Executive Partitions, all steel to ceiling without doors or packing in base, cornice and posts have a sound transmission loss of 36 decibels.

In addition to the items outlined in the exploded view at the right, Mills Executive Partitions offer the following advantages:

POINTS FOR COMPARISON:

- Adjustable door frames, with rubber door strikes.
- Wrap-around base at jambs.
- Universal post, allowing complete panel interchangeability without disturbing adjacent units.
- All parts 100% salvageable.
- Complete accessories, details for special building conditions and hardware, as listed on Page 4.
- Provisions for use of standard electrical components.

specifications

TYPE—Furnish and erect complete The Mills Company Standard Executive Movable Steel Partition.

SHOP DRAWINGS—Detailed shop drawings indicating plans, elevations, hardware, finish, special conditions and construction shall be submitted to the architect for approval before actual fabrication is started.

UNITS— The partitions are to be 3″ thick, with panels 2¾″ thick built in a standard cornice height of either 7′ 4″, 8′ 4″, 9′ 2″ or 10′ 0½″ to the top of the cornice as indicated. All units are to be shipped from the factory in one assembly from floor to cornice in widths of 6″ increments not to exceed 48″ in all steel and 60″ in steel and glass. All are to be interchangeable. All 42″ wide panels will interchange with 42″ wide door sections. Units shall be so assembled that future extensions of either 2–, 3–, or 4-way may be joined together without removing the adjacent units or material above the cornice line.

STEEL—All exposed steel shall be cold rolled, commercial quality furniture stock, properly annealed, process leveled for smooth, clean surfaces. Gauges specified are United States Standard.

PANELS—Shall be 2¾″ thick, fabricated of commercial quality steel permanently bonded to a honeycomb core with aircraft adhesives, encased in a 3″ steel framing around entire perimeter. Panels shall be factory assembled by means of studs welded to all horizontal sections, permitting cutting down in the field. Glass openings to be provided in the upper portion of panels as indicated on the elevations. If desired panels can be furnished at no additional cost with Fiberglas and stiffeners same as Flush Pilaster partition. See page 11.

RAILS—Bottom, chair and top rails shall be made from No. 18 gauge, 3″ rolled steel sections with glass grooves permitting complete interchangeability.

POSTS—Shall be 3″ rolled steel section, No. 18 gauge. Post design shall permit future extension of 2-, 3-, or 4-way without removing adjacent units or material above cornice.

PANEL CONNECTIONS—The panels and door units proper are to be connected by means of plated No. 11 gauge compression and tension clips that properly align and hold units rigid. The clips are to be provided with a wiring hole to permit vertical wiring and shall also be provided with projections for "snapping on" flush pilaster post cap that is held in place without the use of screws, bolts, nuts, etc. These clips are to be designed to permit their application at any point in the height of the unit.

DOORS AND FRAMES— Doors shall be 1¾″ thick with 3/32″ clearance at jambs and heads. They shall be made of flush design with 5″ wide stiles flush with door panels, which shall be sound deadened. All doors to be reinforced for hinges, locks and door checks. (Hinge reinforcement 14 gauge pressed steel channels, lock reinforcement 16 gauge, check reinforcement 14 gauge.) The standard swing door with frame shall fit a 42″ wide section and the door shall be approximately 3′ by 7′. Glass mouldings to be secured without the use of screws. Frames of 18 gauge shall be adjustable type to compensate for varying floor levels and different floor coverings. Proper frame height shall be attained by telescoping head, with jambs being leveled independently for uneven floors by means of internal channels anchored securely to floor maintaining horizontal top lines and glass lines throughout the installation. Frames shall have continuous rubber gasket at head and jambs.

HARDWARE—Shall be interchangeable as to operation as called for in hardware schedule. Doors shall be provided with two 5″ x 4″ loose pin, ball bearing butt hinges.

CORNICE—(For partitions that do not extend to the ceiling). Shall be made to run continuous over top of all units. Cornice to be No. 18 gauge rolled steel section providing maximum rigidity for horizontal bracing and also providing ample utility space.

CEILING TRIM— (For partitions that extend to the ceiling). Shall be made to run continuous over the top of all units to provide rigidity for horizontal bracing and provide a utility space.

FLUSH PILASTER CAPS—Shall be No. 18 gauge rolled shape of flat ornamental inlay design. The surface of same to be flush with face of posts. Caps shall be removable for disassembly and wiring.

BASE—Shall be No. 20 gauge, 4″ high with ¼″ projection. Shall be flat, sanitary design and run continuous along entire bottom of both sides of the partition without obstruction of plinth blocks at the pilasters. Base to be vertically adjustable for normal irregularities in floor elevations. Base shall be removable from either side to provide ready access to utility spaces.

FLOOR CONNECTIONS—Shall be concealed by the base and fit below each post. They shall be securely fastened to the floor. They shall also be provided with plated vertical threaded studs and leveling wheels to permit fine adjustment to normal floor irregularities.

WALL FILLERS—Shall be No. 18 gauge and telescopically adjustable. All raw steel edges and wall fastenings shall be concealed.

TOP FILLER—(Omit if no top filler required). Mineral board top fillers for partitions that extend to ceiling shall be applied over studs set 24″ on center. Top filler shall be double sheet mineral board ⅜″ thick. Joints to be buttered with compound used for that purpose and covered with perforated tape to make joints invisible and prevent cracking. It shall be painted to match ceiling by partition contractor. Steel top filler of No. 20 gauge for partitions that extend to ceiling shall be double steel with single flush line joints. Top filler shall be removable.

FINISH—All partitions shall be thoroughly cleaned in a phosphate solution, rinsed with a rust-inhibitor and properly dried before paint is applied. Partitions are to be permanently finished with an enamel prime and finish coat of alkyd-melamine base and properly baked to ensure durable quality, meeting performance specifications as published on page 4. The finish coat shall be of a uniform "eggshell" texture; color shall be Mills Color No. . . . . or color to be selected. Specify color of base or doors if different from partition color.

GLASS AND GLAZING—(Omit if no glass required). Glass for metal partitions shall be furnished by partition contractor of design, quality and thickness as specified or called for on drawings. Glass shall be set with neutral gray or tan vinyl glazing strips. Glazing stops shall be applied without the use of screws or bolts.

ERECTION—Partitions shall be erected in a rigid manner, straight and plumb, with horizontal lines level. Units shall be aligned at all panel and door unit joints. Hardware shall be thoroughly adjusted and left in good working condition. Provide reinforcements to ceiling or bracing on runs exceeding 20′ in length unsupported by cross runs.

CLEANING—All rubbish and cartons shall be removed and the job left broom clean. All minor defects and blemishes shall be touched up neatly and finger marks removed. Cleaning of glass, erection dust and washing are considered maintenance work to be done by others.

MILLS *Universal* PARTITIONS

As the name implies, an economical partition with a wide range of uses. Adaptable to many general and private office areas, especially useful for moderate cost space division.

OINTS FOR COMPARISON:

- **Modern, clean lines without excess moldings.**
- **Universal post allowing complete flexibility in rearrangement. Extension of post in 2, 3 or 4 ways without distrubing adjacent panels.**
- **Provisions for wiring in cornice, post and base, allowing use of standard electrical components.**
- **Tension and compression post clips provide box girder panel support.**
- **Trim 4″ base, removable from both sides for utility access.**

specifications (Cont'd.)

CORNICE—(For partitions that do not extend to the ceiling.) Shall be made to run continuous over top of all units. Cornice to be No. 18 gauge rolled steel section providing maximum rigidity for horizontal bracing and also providing ample utility space.

CEILING TRIM—(For partitions that extend to the ceiling.) Shall be made to run continuous over the top of all units to provide rigidity for horizontal bracing and provide utility space.

BASE—Shall be No. 20 gauge, 4" high with ¼" projection. Shall be flat, sanitary design and run continuous along both sides of the partition without the obstruction of plinth blocks at the pilasters. Base to be vertically adjustable for normal irregularities in floor elevations. Base shall be removable from either side to provide ready access to utility spaces.

TOP FILLER—(Omit if no top filler required). Mineral board top fillers for partitions that extend to ceiling shall be applied over studs set 24" on center. Top filler shall be double sheet mineral board ⅜" thick. Joints to be buttered with compound used for that purpose and covered with perforated tape to make joints invisible and prevent cracking. It shall be painted to match ceiling by partition contractor. Steel top filler of No. 20 gauge for partitions that extend to the ceiling shall be double steel with single flush line joints. Top filler shall be removable.

WALL FILLERS—Shall be No. 18 gauge and telescopically adjustable. All raw steel edges and wall fastenings shall be concealed.

FLOOR CONNECTIONS—Shall be concealed by the base and fit below each post. They shall be securely fastened to the floor. They shall also be provided with plated vertical threaded studs and leveling wheels to permit fine adjustment to normal floor irregularities.

FINISH—All partitions shall be thoroughly cleaned in a phosphate solution, rinsed with a rust-inhibitor and properly dried before paint is applied. Partitions are to be permanently finished with an enamel prime and finish coat of alkyd-melamine base and properly baked to ensure durable quality, meeting performance specifications as published on Page 4. The finish coat shall be of a uniform "eggshell" texture; color shall be Mills Color No. . . . or color to be as selected. *Specify color of base or doors if different from partition color.*

GLASS AND GLAZING—(Omit if no glass required). Glass for metal partitions shall be furnished by partition contractor of design, quality and thickness as specified or called for on drawings. Glass shall be set with aluminum glazing strips. Glazing molds shall be an integral part of glass frame. They shall be self-seating and insure a positive stop on glass at all times. Loose glazing stops and exposed screws shall not be used.

ERECTION—Partitions shall be erected in a rigid manner, straight and plumb, with horizontal lines level. Units shall be aligned at all panel and door unit joints. Hardware shall be thoroughly adjusted and left in good working condition. Provide reinforcements to ceiling or bracing on runs exceeding 20' in length unsupported by cross runs.

CLEANING—All rubbish and cartons shall be removed and the job left broom clean. All minor defects and blemishes shall be touched up neatly and finger marks removed. Cleaning of glass, erection dust and washing are considered maintenance work to be done by others.

A see-over partition, Mainliner 54" gives the feeling of a separate office—makes concentration easier, but allows a view to other areas.

MAINLINER "42"

For departmental divisions or subdivisions, for attractive reception areas and many other uses, Mainliner railing-height partitions are ideal.

MAINLINER PARTITIONS

specifications

TYPE—Furnish complete, with exception of glass and erection, The Mills Company standard Mainliner Movable Steel Partitions.

UNITS—Partitions shall have 1¾″ square posts with steel panels 1½″ thick, designed to be assembled in standard heights of 84″, 68″, 54″ and 42″ from floor to top of partition. They shall be made up of standard steel or steel and glass components (as required) assembled as indicated in plans and elevations. Partitions shall be shipped from the factory in panel widths from 12″ to 66″ in 6″ increments. Future extentions of assembled units that have the same height or a lower height for either 2–, 3–, or 4-way conditions may be made without replacing posts.

STEEL—All exposed steel shall be cold-rolled commercial quality furniture stock, process leveled for smooth, clean surfaces. Gauges Specified are U.S. standard.

STEEL PANELS—Shall be 1½″ thick, fabricated of two steel sheets, permanently bonded to a honeycomb core with aircraft adhesives, framed internally with 20 gauge horizontal and 14 gauge vertical channels. Each panel end shall be provided with two high carbon steel spring locking devices for attachment to post. Snap-in wire raceway channels at bottom of panel shall be allowed for continuous wiring through pass-through in electrical post.

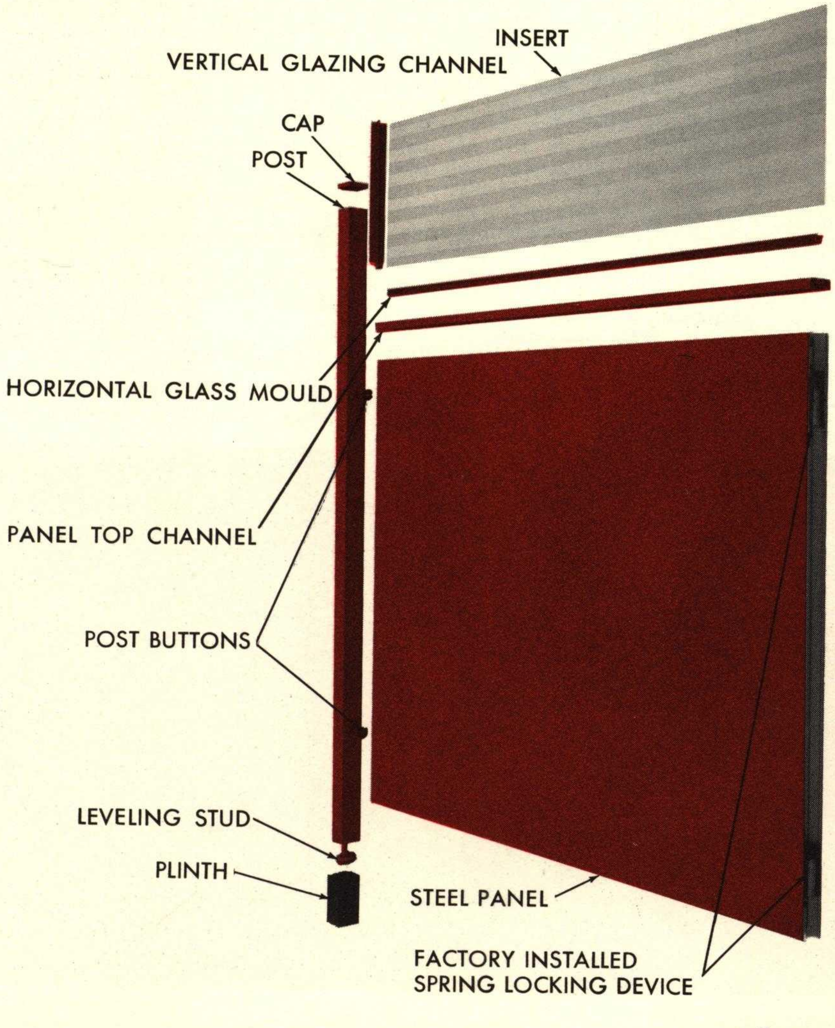
raceway channel at bottom of panel shall allow for continuous wiring through pass-through in electrical post.

PANEL TOP CHANNEL—For all panels except 42″ height shall be rolled steel, designed to receive vinyl glass mold. Top channel for 42″ height similar, but without glazing groove.

VERTICAL GLAZING CHANNEL—Shall be furnished for partitions over 42″ in height. It shall be a rolled steel channel designed to receive all thicknesses of glass to and including ¼″. Two spring steel glazing clips per unit shall be furnished when ⅛″ or 7/32″ glass is used.

HORIZONTAL GLASS MOULD—Shall be neutral gray vinyl, designed to fit snugly into horizontal glazing channel for units to be glazed. It shall receive all thicknesses of glass to and including ¼″.

POSTS—Shall be 16 gauge, 1¾″ square steel tubing, pre-drilled to receive 1–, 2–, 3–, or 4-way connections. Post shall be furnished with ¾″ lanced hole on each side near bottom for wiring pass through. Bottom shall be prepared for adjusting stud. One post to be furnished with each panel—additional post of height required shall be specified for use at end of panel run. **ELECTRICAL POST**— Shall be the same as standard post but with addition of duplex outlets and 7 foot long cord with standard plug for connecting to electrical system.



PANEL CONNECTIONS—Two factory-installed spring locking devices shall be attached to each panel vertical channel to interlock with tapered steel button on post. Post locking buttons to be applied with Parker-Kalon metal screws in pre-drilled holes.

WALL FITTINGS—Standard connection to fixed walls or columns shall be made with two heavy-gauge steel wall "U" or "F" brackets, finished in partition color.

POST CAP—Shall be a pressed steel stamping finished in partition color, or natural finish anodized aluminum, to cover top of post and secure vertical glazing channel.

GATES—42″ high gates shall be 1½″ thick, consisting of two face sheets permanently bonded to honeycomb core, similar in construction to panels. They shall be single acting and shall be mortised and reinforced for hardware application.

54″ and 68″ gates shall be of same construction as 42″ gates, but with provisions for glazing to match adjoining panels.

DOORS—For 84″ height shall be 1½″ thick with 3/32″ clearance at jambs and heads. They shall be of flush design and sound-deadened. All doors to be reinforced for hinges and lock or latchsets. The standard Mainliner swing door with frame shall fit a 36″ wide section, and the door shall be approximately 2′-9″ x6-′2″.

END FILLERS—Shall be same construction as panel units except one end only will have provisions for attaching to post. Wall end to telescope into wall channel fastened to wall. Height of Filler to match adjacent panel, with open or closed base as specified.

HARDWARE—For 42″ Gates: Shall be Mills standard push and pull plates, with Mills standard roller latch. 54″ or 68″ gates and 84″ doors shall be provided with Mills standard Mainliner latch set or cylinder lock set, as specified. Hardware finish shall be U.S. 26-D dull chrome or U.S. 10 dull bronze-

FLOOR CONNECTIONS—⅜″ threaded leveling stud with locked-in vinyl foot shall be secured to bottom of each post to prevent movement on flooring and to provide adjustment for uneveness in floor. Assembly shall be concealed by 4″ high black vinyl or natural finish, anodized aluminum plinth. For continuous runs over 10′-0″ at gate and door openings and at free-standing ends, floor anchors shall be used. Anchors shall be two ⅜″ thick gray iron castings designed to slide up into post and tightened with a set screw inserted between castings. Two wood screws and floor inserts shall be furnished with each anchor member—assembly painted black or aluminum to blend with post plinths.

FINISH—After thorough cleaning and drying, partition units shall be permanently finished with an acrylic enamel, properly baked to ensure durable quality. Color shall be chosen from sixteen designer-selected colors, appearing on Mainliner color charts. Other colors may be matched at additional cost, upon submission of paint sample.

GLASS—Shall be by others. Mainliner is designed to receive any type of glass up to and including ¼″ thickness except ¼″ wire glass. Top edges of exposed glass shall be seamed to remove sharp edges.

MILLS *Commercial* PARTITIONS

Used throughout the nation in factories, warehouses, institutions and other buildings. Recommended for departmental divisions, factory offices, tool cribs and stock rooms.

POINTS FOR COMPARISON:

- **Universal 3″ square posts for extension in 2, 3, or 4 ways without removing standing units.**
- **Unobstructed wiring areas in cornice, base and post, with provisions for standard-sized electrical components.**
- **May be extended to any ceiling height and to fit irregular roof construction.**
- **Sturdy, all-steel construction and continuous post reinforcements.**
- **Durable baked enamel finish.**

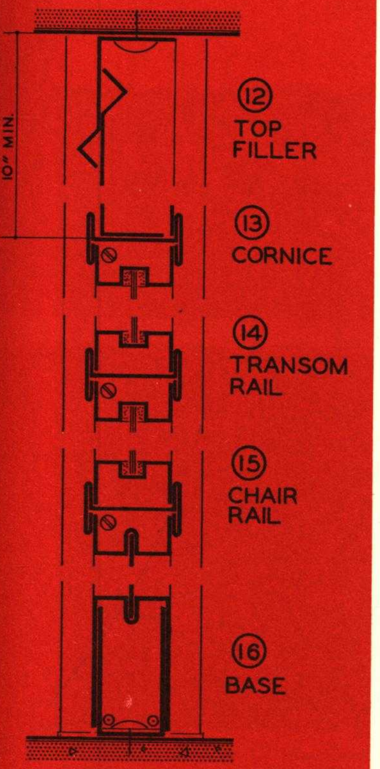
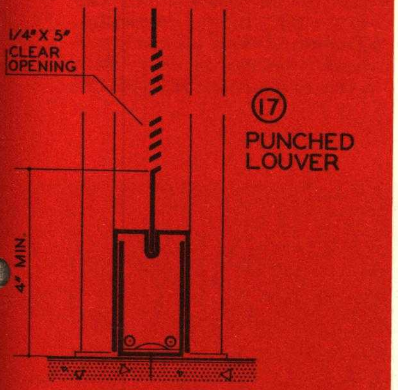
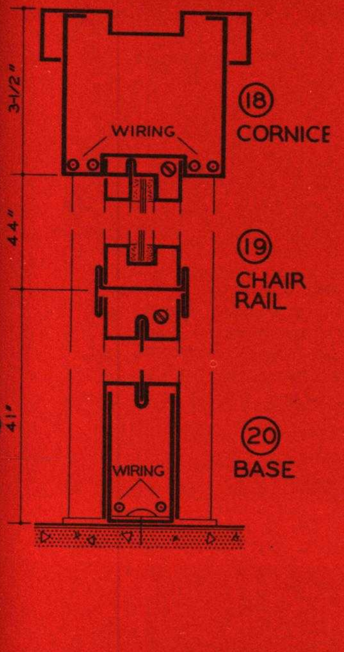
COMMERCIAL PARTITIONS







specifications

TYPE—Furnish and erect complete The Mills Company Standard Commercial Movable Steel Partition.

SHOP DRAWINGS—Detail shop drawings indicating plan, elevation, hardware, finish, special conditions and construction shall be submitted to the architect for approval before actual fabrication is started.

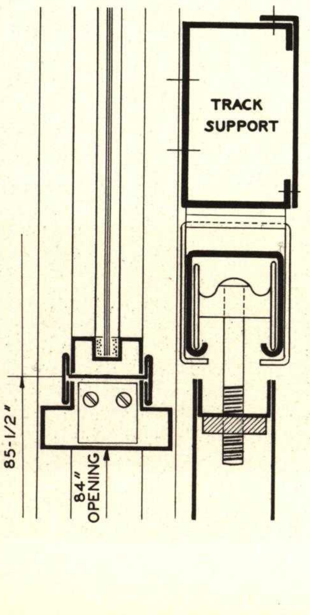
UNITS—All units shall be built in multiple widths of 10″ and constructed so that two 40″s, a 50″ and a 30″ or four 20″s will fit in the same space taken by an 80″ unit. Also, door and frame section will interchange with a standard panel measuring 40″. Units shall be so constructed and assembled that future extension of either 2–, 3– or 4-way may be joined together without removing the adjacent units or using fillers.

STEEL—All exposed steel shall be cold rolled, commercial quality furniture stock, properly annealed, process leveled for smooth, clean surfaces. Gauges specified are United States Standard.

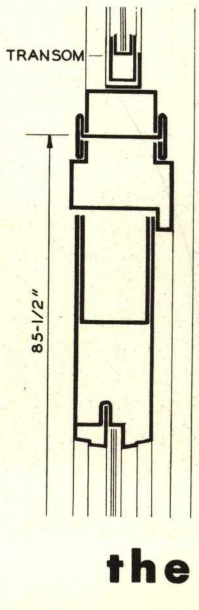
PANELS—Steel panels shall be constructed of standard units of 22 gauge frames and 18 gauge sheets, welded in place to reduce rattle and sag and retain square units. Glass frames shall be constructed of standard units of 22 gauge frames welded in place to retain square units. Lower panels shall be approximately 42″ high with upper panels or glass frames either 44½″ or 22¼″ high. Units shall be assembled in partitions by means of concealed bolts to posts and interlocked vertically by means of a 20 gauge horizontal H-section rail running between posts.

POSTS—Posts shall be No. 18 gauge 3″ square—one side removable to provide space for wiring and attachment of concealed bolts from panels, glass frames and doors. The faces of posts to be recessed to receive panels, glass frames, etc., to conceal raw edges and form a light shield. Bottom of posts to have opening for wiring. Post caps of No. 18 gauge shall be of the same general design as posts and snap-on over blisters provided in the posts to hold securely without the use of screws, bolts or nuts.

㉑ SLIDE DOOR HEAD AND TRACK ASSEMBLY



㉒ STANDARD DOOR HEAD



BASE—Base of No. 20 gauge shall be 3″ high and fit over a floor channel for telescopic adjustment to take care of floor irregularities and provide a utility space.

CORNICE—Cornice, when required, shall be 4½″ wide x 3½″ high of No. 18 gauge two-piece box construction. Cornice shall be hollow to allow for concealed wiring.

WALL FILLERS—Adjustable wall fillers are to be used at the ends of runs. They shall be securely fastened to the building wall.

TOP FILLER—Single steel filler plates of No. 20 gauge ordinarily provided for ceiling height partitions with continuous posts from floors to ceiling.

Mineral board top filler from cornice to ceiling furnished if specified.

DOORS AND FRAMES—Doors shall be 1¾″ thick with 3/32″ clearance at jambs and heads. They shall be made of flush design with 5″ wide stiles flush with panels, which shall be sound deadened. All doors to be reinforced for hinges, locks and door checks. (Hinge reinforcement 14 gauge pressed steel channels, lock reinforcement 16 gauge, check reinforcement 14 gauge.) The standard swing door with frame fits 40″ wide section and be approximately 3′ x 7′. Glass moldings to be secured without the use of screws. Frames of No. 18 guage shall be unit type— factory welded and finished.

HARDWARE—Shall be interchangeable as to operation as called for in hardware schedule.

Doors shall be provided with two 5″ x 4″ loose pin ball bearing butt hinges.

FINISH—All partitions shall be thoroughly cleaned in a phosphate solution, rinsed with a rust-inhibitor and properly dried before paint is applied. Partitions are to be permanently finished with separate baked on enamel prime and finish coat of alkyd-melamine base and properly baked to ensure durable quality, meeting performance specifications as published on Page 4. The finish coat shall be of a uniform "eggshell" texture; color shall be Mills Color No. . . . or color to be as selected. Specify color of doors if different from partition color.

GLASS AND GLAZING—(Omit if no glass required). Glass for metal partitions shall be furnished by partition contractor of design, quality and thickness as specified or called for on drawings. Glass shall be bedded in putty and back puttied. Putty shall be colored to match the finish of adjacent metal work. Glazing stops and muntins shall be applied without the use of screws or bolts.

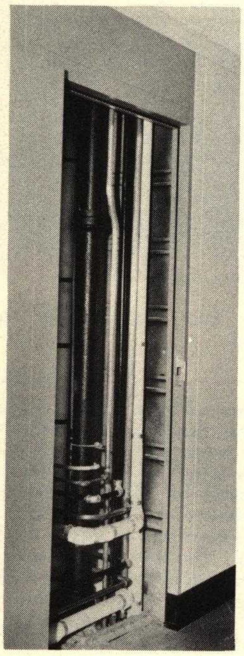
ERECTION—Partitions shall be erected in a rigid manner; straight and plumb, with horizontal lines level. Units shall be aligned at all panel and door unit joints. Hardware shall be thoroughly adjusted and left in good working condition. Provide reinforcements to ceiling or bracing on runs exceeding 20′ in length unsupported by cross runs.

CLEANING—All rubbish and cartons shall be removed and the job left broom clean. All minor defects and blemishes shall be touched up neatly and finger marks removed. Cleaning of glass, erection dust and washing are considered maintenance work to be done by others.

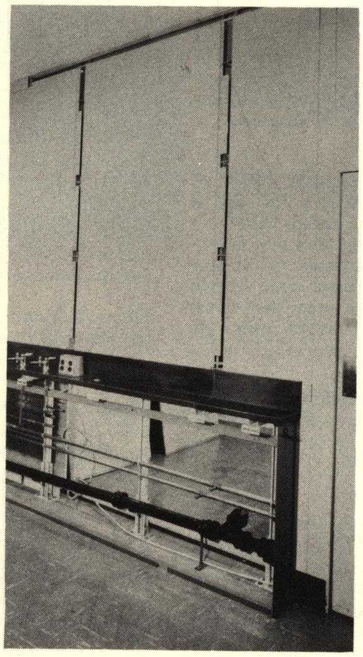
ACCESSORIES

Pictured and detailed in this section are some of the many accessories which make Mills movable walls and partition systems completely versatile and adaptable to individual requirements for convenience and utility.

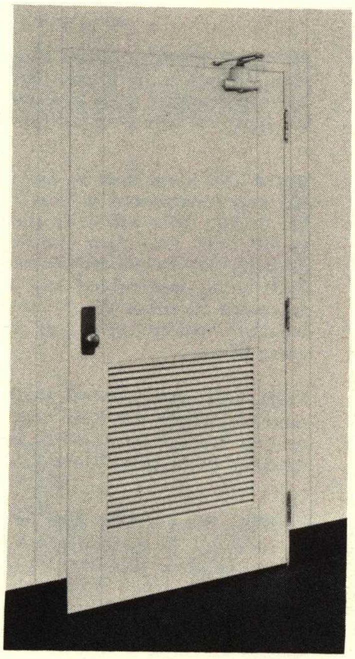
(See Accessories list, page 4)



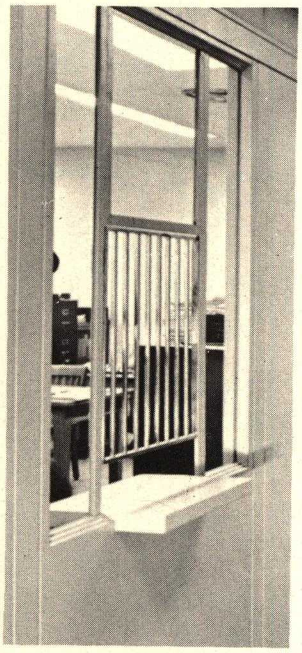
ACCESS SHAFT ENCLOSURE—Encloses vertical service pipes, drains and conduit. Full size (3′ x 7′) door provides complete access for easy maintenance of facilities.



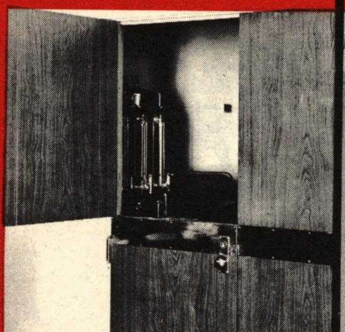
LABORATORY BENCH SERVICE STRIP—Encloses horizontal service pipes, drains and conduit for immediate access to working bench. Completely adaptable to changing service conditions enclosed.



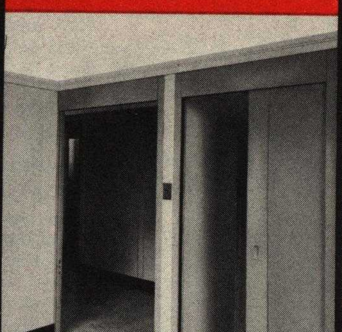
LOUVRES—Air conditioning technique demands adequate facilities for air circulation. Louvred panels and doors are available in standard sizes and are interchangeable with solid doors or standard partition panels.



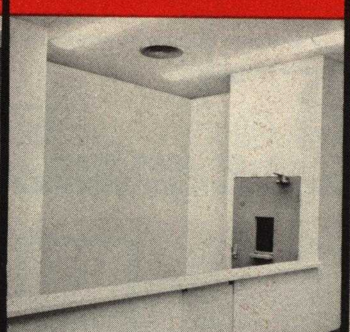
WICKETS—Available in Mills panels and doors. Stock size 18″ x 24″, hinged or sliding. Furnished with painted steel deal plates, covered with glass or linoleum if specified.



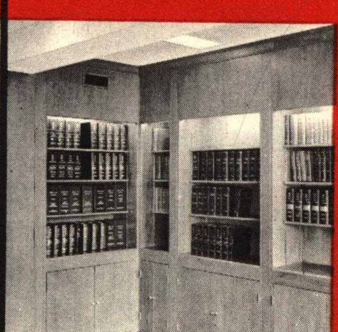
DUTCH DOORS—Used wherever it is desirable to pass materials in and out and at the same time prevent general access. Equipped with deal plates on both sides. Doors may be all-steel, steel and glass, or steel and wire mesh.



SLIDING DOORS—Slide into partition, close by gravity, are equipped with an automatic felt drop. Eliminate arc of door swing, thus saving valuable room space. Ball bearing hangers with fiber rollers insure easy, quiet operation.

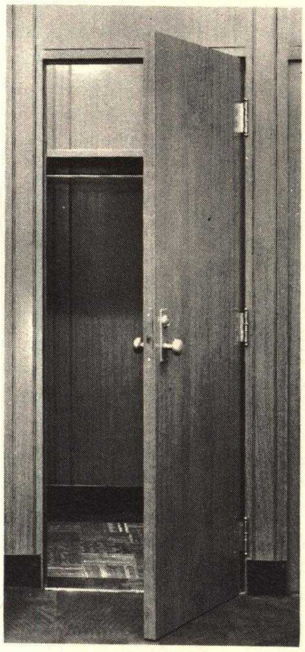


COUNTERS AND CABINETS—Combination counters and cabinets embodying the same structural details and movable features as Mills standard partitions and railings meet individual requirements and permit rearrangement.

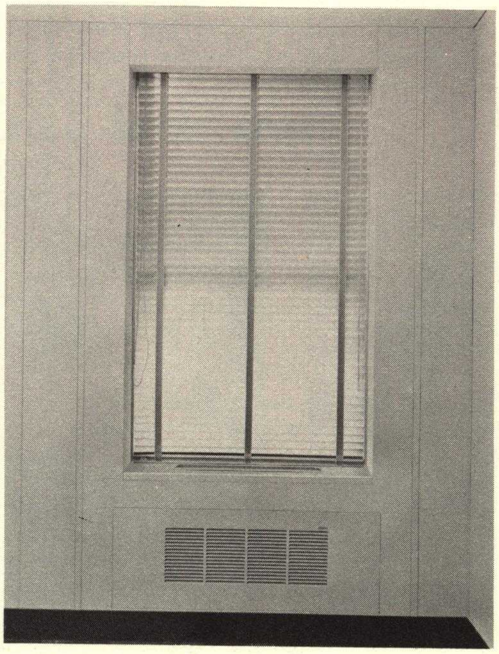


BOOK CASES—Furnished with or without doors in a standard unit of Mills 3″ Flush Pilaster Partition and interchangeable with any standard unit.

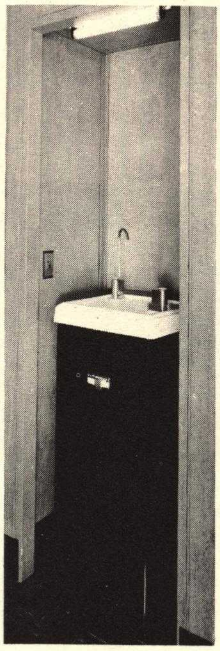
ACCESSORIES



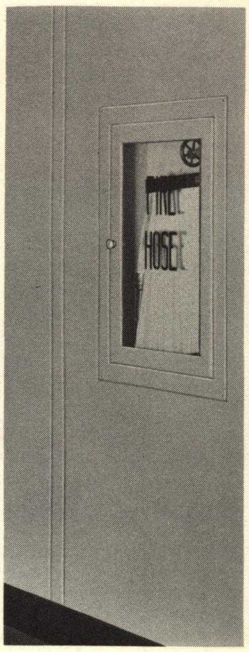
CLOSETS—Made of standard Mills partition sections which match the wall construction exactly, and may contain louvres for forced ventilation. All are equipped with hat shelf and coat rod.



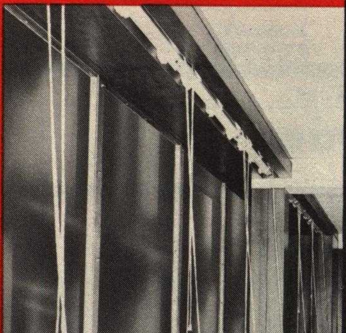
WINDOW EMBRASURES—Attractive window stools and grilled radiator fronts with practical, removable panels conceal unattractive radiators. Designed and finished to match the adjacent walls and partitions, the window embrasures combine ready accessibility with architectural symmetry.



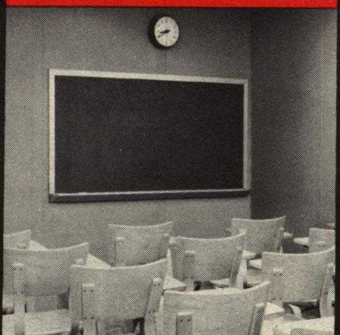
DRINKING FOUNTAIN ALCOVES — Made of standard sections to permit placing the fountain out of the line of hallway traffic.



HOSE CABINETS—Flush door with glass panel which may be easily removed to give access to unit or piping. Concealed hardware with no projections.

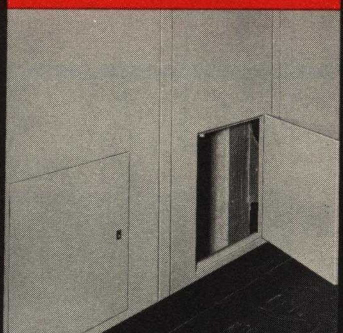


VENETIAN BLIND POCKETS—Are incorporated in the window embrasure. They conceal operating mechanism and blind when it is raised and harmonize perfectly with the design of surrounding partitions and wall linings.

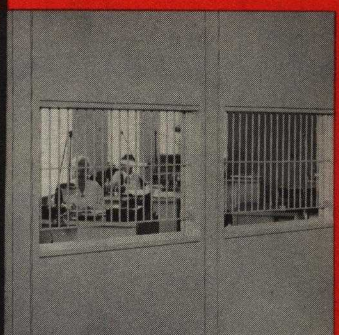


CHALK BOARDS—Modern school design seeks flexibility.

Standard size chalk boards and tack boards with customary accessories are adapted to Mills standard partition to permit rearrangement.



ACCESS DOORS — For access to pipe valves, vent dampers, etc. Size 24″ x 24″ x ¾″ thick, flush type, fully insulated. Concealed Soss hinges, friction catches, and drop ring pulls flush with surface. Vital for maintenance of modern facilities.



GRILLES—Steel, painted to match partition, slideup type to permit passing large packages. Also furnished hinged on either side or fixed in position.

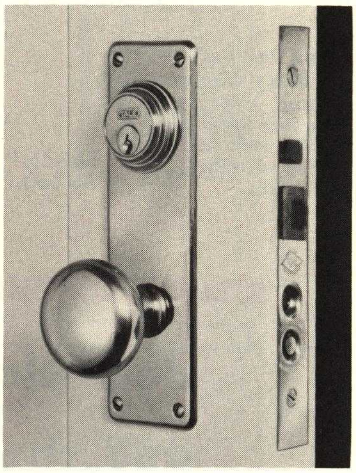
HARDWARE

Mills standard hardware, shown on these pages, is designed for use with all types of Mills interiors. Various types of locksets in tubular or cylinder style are interchangeable in mortises for that style. The hardware shown is carried in stock for immediate delivery. Specifications of non-stock hardware will cause a twelve week delay in scheduling as well as add to the cost of the installation. Mills hardware should be used since it is best installed on doors at the factory. Master key and sub master key systems can be furnished at any future time for use with standard hardware and standard doors.

mortise lock sets

All mortise lock sets are made to template and are interchangeable. Backset 2¾"; lock face 1⅛" x 8"; escutcheon 2$\frac{3}{16}$" x 7⅜". Master keyed cylinders of all standard makes fit Mills locks.

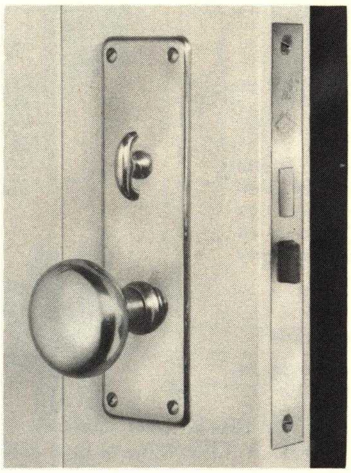


CT 76561 Pick-Proof Cylinder Lock Set

Operates by knob from inside and key from outside at all times. Outside knob is locked by stop in face. Auxiliary latch automatically deadlocks latch bolt so it cannot be forced back when door is closed, but does not prevent operation by key or knobs.

CT 77901 Cylinder Lock Set

Same as above but without auxiliary latch.

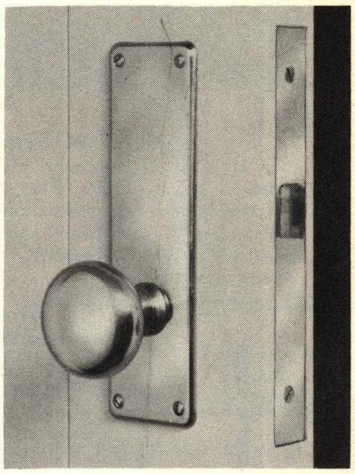


CT 715351 Single Communicating Lock Set

Operates by knob from either side. Thumb turn on inside only operates the dead bolt. Center of knob 40½" above floor.

CT 715251 Double Communicating Lock Set

Same as above but with divided dead bolt. Thumb turns on both sides, each operate one half of dead bolt, making it possible to lock door from both sides independently.



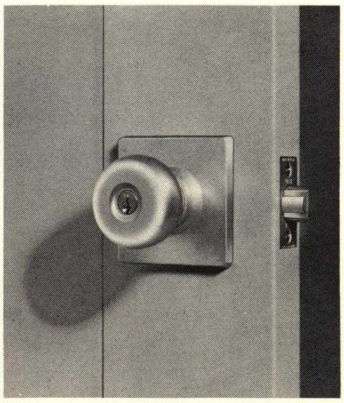
CT 710341 Latch Set

Latch Bolt operates by knob from either side, no locking device. Center of knob 40½" above floor.

Standard Finish—U.S. 10
(Dull Bronze) Also Available:
U.S. 28 Alumilite
U.S. 26-D Dull Chrome

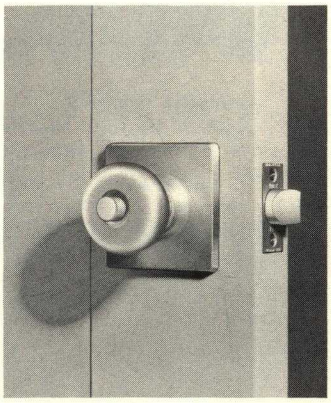
tubular lock sets

Key in knob simplifies detail on face of doors. Backset 2¾". Lock face 1$\frac{1}{16}$" x 2½". Knob diam. 2¼". Rose 3¼" Square. Master keyed with other similar type locks of same manufacturer.



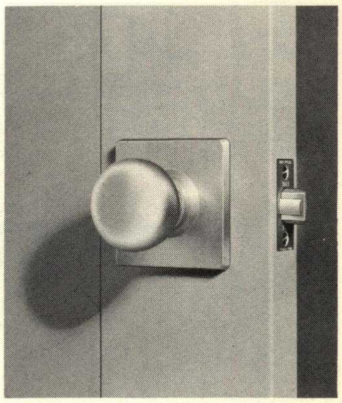
LW 5304 Deadlocking Tubular Lock Set

Operates by knob from inside and key from outside at all times. Outside knob is locked by push button in center of inside knob.



LW 5303 Single Communication Lock Set

Operates by knob from either side. Push button on one side locks knob on opposite side.

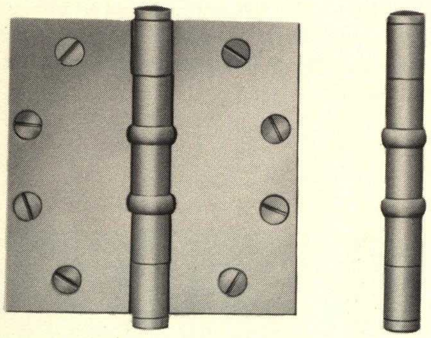


LW 5301 Tubular Latch Set

Plain latch bolt operates by knob from either side. No locking mechanism.

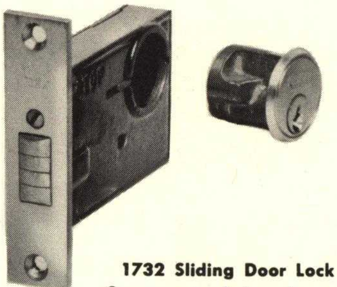
HARDWARE . . . *Continued*

hardware for doors



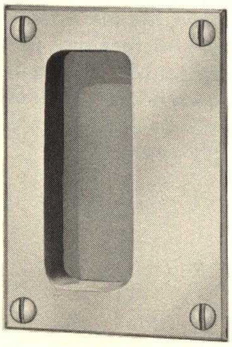
BB 179 Butt Hinges

Size 5″ x 4″ of hardened steel, .134″ thick polished bronze finish. Flat button tip. Ball bearing washers provide noiseless operation and long life. Two butts to each door up to and including 36″. Over 36″ three butts per door are furnished.



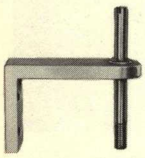
1732 Sliding Door Lock

Operated by key. Hooked latch engages with cast bronze keeper. Backset 2¾″; lock face 1″ x 4″. Used with flush door pull at right.



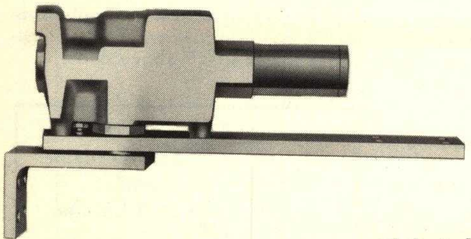
712 Flush Door Pull

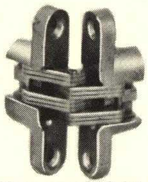
Size 2¾″ x 4″. Bronze finish, furnished for both sides of sliding doors.



1804 checking gate pivot

For glazed railings. Single acting. Top element installed in cutout below glazed panel. Bottom element concealed in bottom of gate.





204 concealed hinge

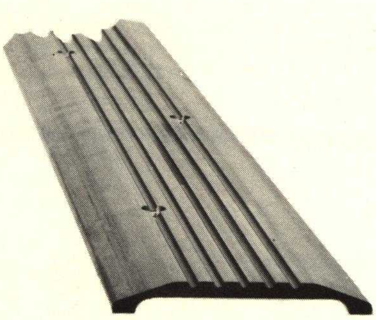
For hinged cabinet doors. Fly leaf hinges invisible when door is closed.

5813 flush ring pull

For flush cabinet and access doors.

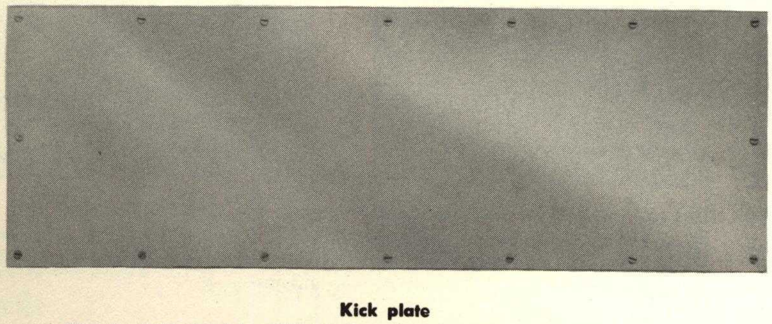
FB 13X door stop

Double floor support for firm anchorage. Height 1″; rubber bumper 1½″ wide.



Corrugated threshold

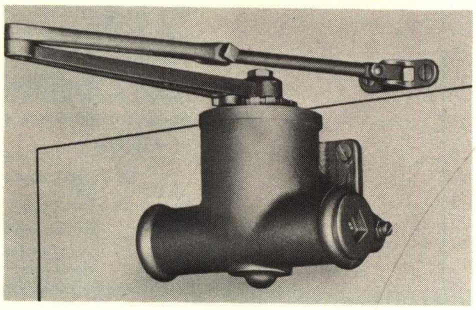
Height ½″; width 4″. Specify whether beveled both sides, or one side square for use with carpeting.



Kick plate

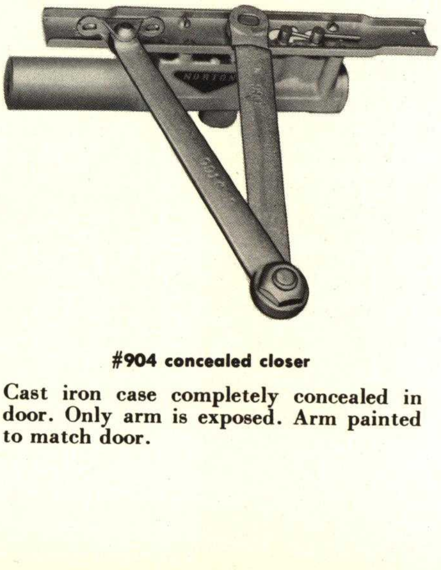
Height 10″. Width, 2″ less than width of door. Specify whether one or both sides.

door closers and checks



Size C, surface closer

Cast iron case painted to match partition. Holder arm, for holding door open, furnished when specified.



#904 concealed closer

Cast iron case completely concealed in door. Only arm is exposed. Arm painted to match door.

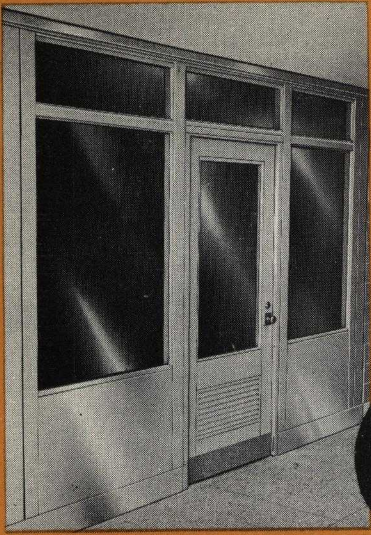
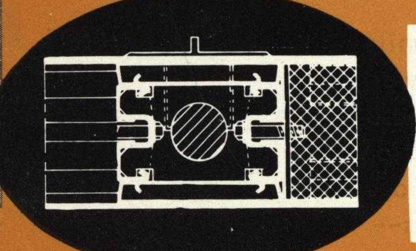
CLEVELAND 10, OHIO

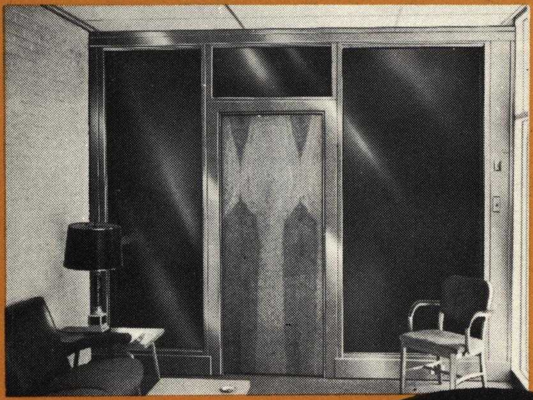
NATIONAL
STEEL
PARTITIONS

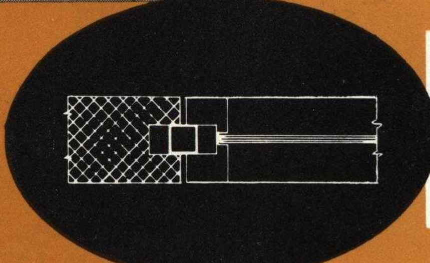




FLUSH TYPE —"F" PARTITIONS

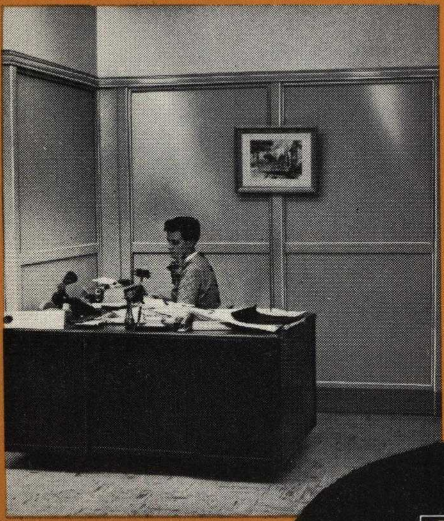
Completely flush wall, 3" thick. Available as all steel, or steel and glass combinations. Quick access to wiring. Ceiling or cornice high. Easily moved and rearranged. Widely used in office buildings, schools, institutions, etc.





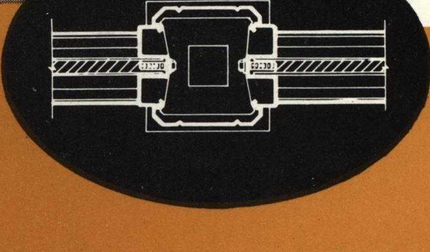
UNIWALL TYPE —"S" PARTITIONS

Flush, 3" thick partitions, with Rockwool filled panels. Panels interlock, making one thin dividing line. All steel or steel and glass combinations. Simple to erect – and to relocate as desired.



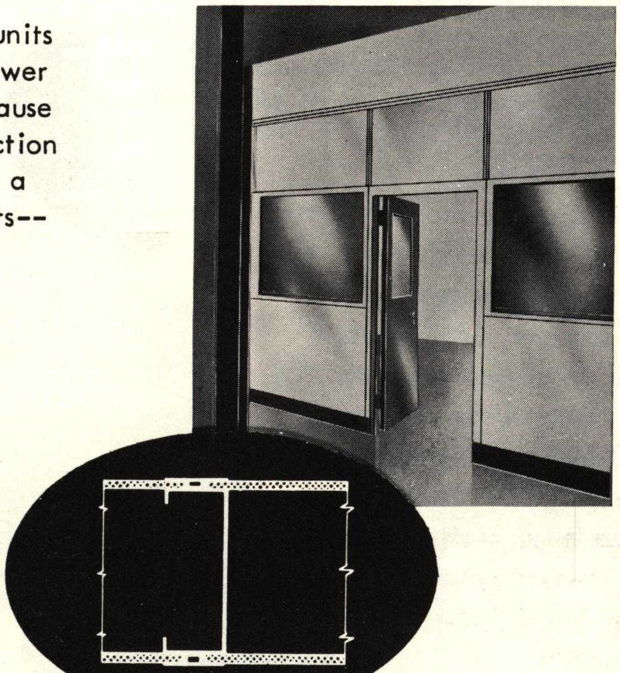
SM—TYPE PARTITIONS

Economy is secured, while maintaining advantages of more expensive types of partitions. Panels are 3/8" thick, with insulating material packed between the steel sheets. 3" thick posts. Easy to relocate or rearrange.



MOVEABLE STEEL PARTITIONS by NATIONAL

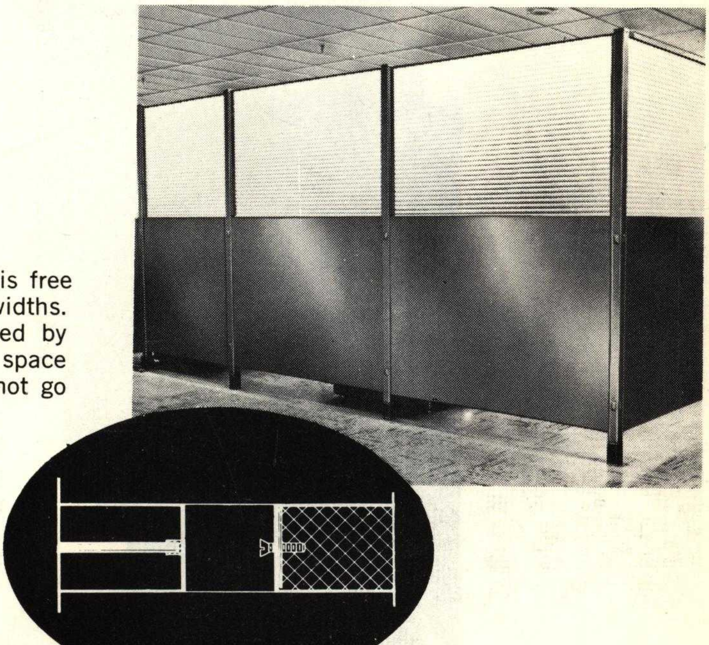
National's moveable walls are in standard units which give complete flexibility of use . . . lower cost of installation--and maintenance. Because of their unique design, and the mass-production techniques in making them, you can secure a wall arrangement to fit specific requirements--at lower cost.



DYNAWALL TYPE –"D" PARTITIONS

A commercial type partition, favored in factories, warehouses, laboratories, institutions, etc. May be built up in combinations of glass, steel mouldings and various non-metallic panels to any ceiling height. Simple to erect and relocate. Full panel interior accessible for wiring and piping.

ALL TYPES for ALL APPLICATIONS



SNAP-JOINT TYPE –"P" PARTITIONS

Complete flexibility may be achieved by this free standing partition. Various heights and widths. Units are interchangeable and easily moved by non-skilled labor. Especially adapted for space divison in those areas where partitions do not go to the ceiling.

Beautiful Colors
THAT RESIST YEARS OF USE ... and even abuse.

FULL RANGE OF COLORS TO FIT ANY DECOR

In order to provide moveable steel partitions in color which resist the harsh effects of fluorescent lights as well as of sunlight... colors which take the abuse of cleaning activities and of human wear and tear —National has developed a special paint process which insures beautiful, permanent color. There is a shade and hue to fit all decor requirements.

maintain their beauty for years — with a minimum of care.

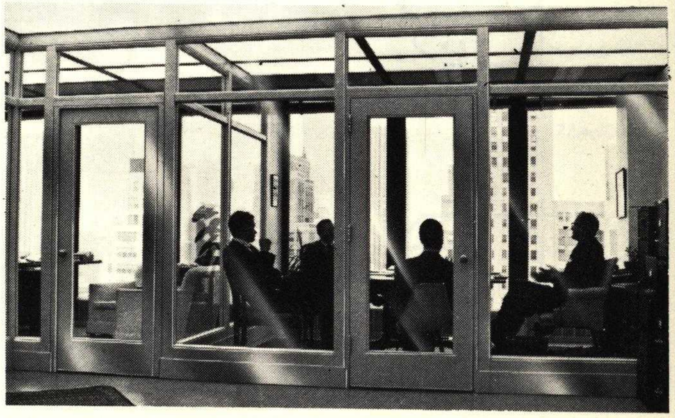
FLUSH TYPE-F PARTITION

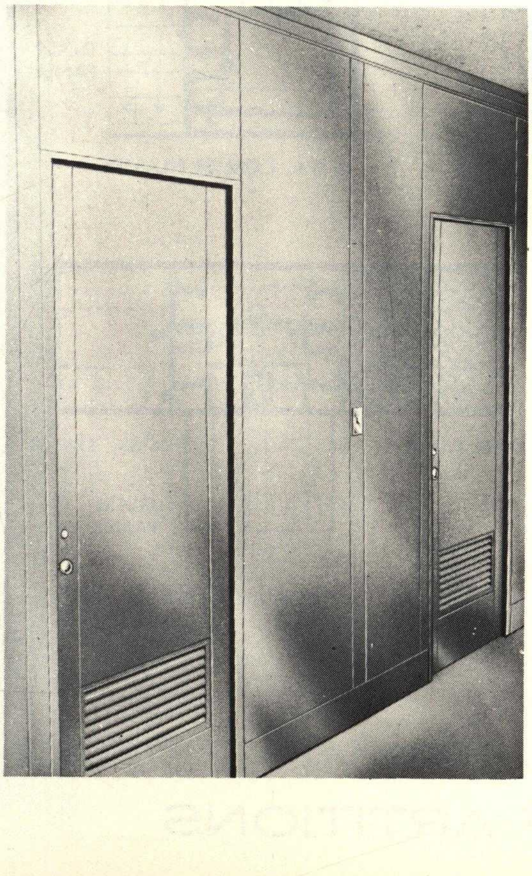
Flush Type "F" Partitions provide a completely flush wall, 3" thick. The factory assembly of panel units by bolting and field joints by patented clips provides the strongest possible construction in a movable wall. Filler is of rockwool, 3" thick.

At left is installation in the main offices of the Daitch Shopwell Super Market, New York, of a combination steel and glass Flush Type "F" Partition, 7'-2¼" high. This is a steel and glass partition with mineral board top filler.

The Flush Type "F" Partition is easily moved and relocated. The 18 ga. vertical channels are bolted to the panels for ease of assembly and replacement of damaged panel faces. The stiffeners are 24 ga., 12" on center, spot-welded 3" on centers.

At the right is a Flush Type "F" Partition, 8' high with open lite ceiling-high partition. This installation is in the Francis H. Cabot Advertising Agency, New York City.





The Flush Type "F" Partition is used widely in office buildings, schools, institutions, etc. because it is easily moved and simply designed, yet sensible in cost. Available in all steel or steel and glass panels. All units are made in 6" increments. Maximum is 48" in steel panels and 54" in steel and glass panels.

NATIONAL ***Moveable*** STEEL PARTITIONS

specifications

GENERAL

Completely furnish and erect National Steel Partition Company's Flush Type F Steel Partitions as specified herein.

SHOP DRAWINGS

Detailed shop drawings of complete plan showing partition, layout typical elevations, hardware schedule, finish and any special conditions and construction shall be submitted for approval to the architect before fabrication and assembly.

ERECTION

Installation of all steel partition runs shall be on top of the finished flooring. All partitions shall be fitted to existing building conditions and shall be erected in a substantial and rigid manner, straight and plumb with horizontal lines level. All units shall be aligned at joints and interlocked. Floor fastenings shall be completely concealed and adjustable to floor level variations.

CHANGEABILITY

Any layout change which is desired shall be easily and economically executed without debris or dirt and with 100% salvage. Partitions and doors shall be completely interchangeable with units of like size. Panel and door units may be dismantled and reinstalled without disturbing adjacent units.

MATERIALS

Exposed steel shall be commercial quality cold-rolled properly annealed and roller leveled with smooth, clean surfaces. All gauges of specified metal are U. S. Standard.

UNITS

For future extensions of either 2-, 3-, or 4-way, units shall be so assembled that extensions may be joined without removal of adjacent units or material above cornice line. The partitions are to be 3" thick, height shall be standard cornice of either 7'-2¼", 8'-2¼", 9'-2¼" or 10'-2¼" to top of cornice trim as indicated. Factory will ship all units in one assembly from floor to cornice in widths of 6" increments not to exceed 48" in all steel and 54" in steel and glass.

PANELS

Shall be made of two sheets of 20 gauge and insulation 3" thick. Panels shall be flush with face of post caps and the sheets proper shall be reinforced with horizontal stiffeners spot-welded on 3" centers and these stiffeners shall be placed approximately every 12" in the height of a sheet.

Rockwool filler shall be packed solid between panel sheets for further sound absorption and backing to the sheets.

An alternate construction shall omit the horizontal stiffeners and substitute honeycomb for rockwool insulation.

As indicated in elevation, glass opening shall be provided in upper sections of panels for either single glass or hermetically sealed double glass units.

DOORS, TRANSOMS AND DOOR FRAMES

Doors shall be made flush with No. 20 gauge 5" wide styles flush with No. 20 gauge pans which shall deaden sound. Standard swing door with frame shall fit a 42" wide section and the door shall be 3' x 6'-10". Doors shall be reinforced for hinges, locks and door checks. Hinge reinforcement shall be 10 gauge, lock reinforcement 10 gauge, check reinforcement 14 gauge. Doors shall be 1¾" thick with 3/32" clearance at heads and jambs. All transoms are to be center pivoted and pole operated. All frames shall be of floating type, of 18 gauge steel, to compensate for various floor coverings at different floor levels. Frame height shall be adjusted by telescoping head. Continuous rubber gasket shall be installed at head and jambs of all frames.

HARDWARE

All hardware shall be interchangeable as called for in schedule of hardware. Two 5" x 4" loose pin ball bearing butt hinges shall be provided for all doors. Mortise latches in U. S. 10 finish shall be standard Cylinder locks of varying functions, finishes and designs also available.

BASE

The base shall be No. 18 gauge, 6" high with ¼" projection, plinths will normally be used at posts to allow the base to more closely conform to the floor. If desired, bases can be furnished in continuous lengths with the plinths omitted. Bases are to be vertically adjustable. In order to allow easy access to utility spaces, base shall be made removable.

CEILING TRIM

(For those partitions that extend to ceiling.)

They shall be constructed to run over all units to ensure rigidity for horizontal bracing. They shall be provided with a lay-in type wire raceway easily accessible from either side of unit. Raceway and internal cornice to be concealed by snap-in ornamental trim of No. 20 gauge.

CORNICE

(Provided for those partitions that do not reach ceiling.)

Cornice shall run in a continuous line over top of units. No. 18 gauge rolled steel section giving maximum rigidity for horizontal bracing. They shall also be provided with a lay-in type wire raceway.

FLUSH POST CAPS

Caps shall be of removable type for easy wiring and disassembly. Surface of caps to be made flush with panel face. They shall be of flat design in No. 18 gauge.

WALL FILLERS

Shall be telescopically adjustable and have no exposed raw steel edges or wall fastenings. They shall be of No. 20 gauge.

TOP FILLER

(Omit if no top filler required.)

For partitions that extend to ceiling, Mineral board top fillers which are double sheet mineral board ⅜" thick, shall be applied over wood studs set 24" on center.

As an alternate, steel top filler of No. 20 gauge can be supplied with single flush line joints and made of double steel and shall be removable.

FLOOR CONNECTIONS

All floor connections are concealed at base and all fittings shall be made below each post. They shall be provided with leveling shims for adjustment to normal floor irregularities. Connections are to be securely fastened to floor.

PANEL CONNECTIONS

All units proper are to be connected by No. 11 gauge compression and tension clip that maintains unit rigidity and properly aligns connecting units. In order to permit vertical wiring, clips are provided with a wiring hole and projections for snapping on flush post cap that are to be held in place without bolts, nuts, etc. Application of clips may be made at any point in height of unit.

FACTORY FINISH

All exposed surfaces of completed partitions shall be thoroughly cleaned in a phosphate solution, rinsed with a rust inhibitor and properly dried prior to paint applications. Partitions are finished permanently with an enamel coat of alkyd-melamine base and baked to ensure quality and durability.

The finish coat shall be of "eggshell" texture, uniform throughout; color shall be National Steel Partition Company's Color No. .... or color to be as selected. If base and door colors are different from partition colors, specify National Steel Partitions Company Color No. ....

GLASS AND GLAZING

Glass for metal partitions shall be supplied by partition contractor and shall be of a quality, thickness and design as specified in drawings. As called for in specifications, glass shall be set in putty tinted to match partition or neoprene glazing strips. Glazing molds shall be self-seating and ensure a positive stop on glass at all times.

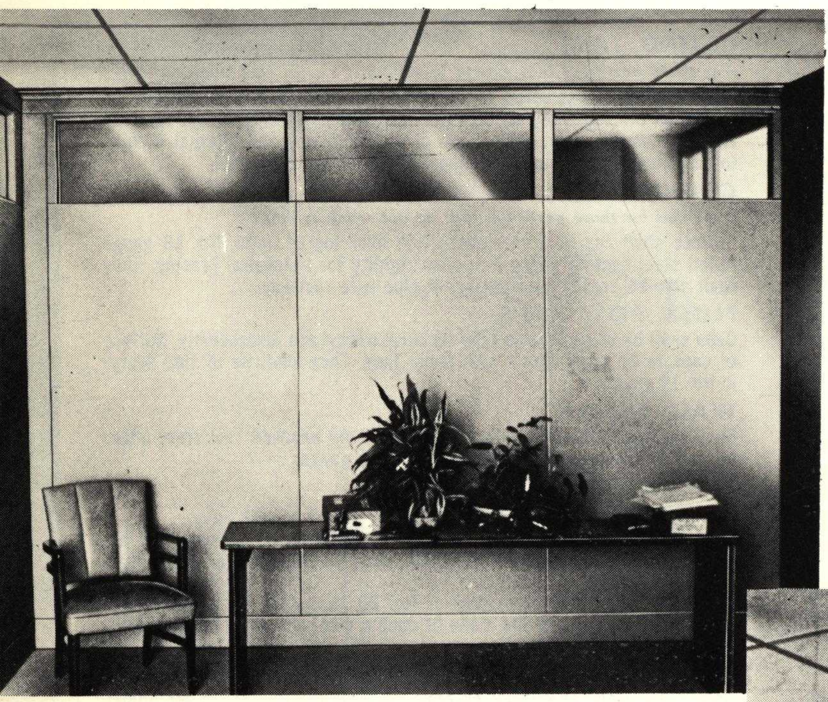
SOUNDPROOFING

Partition runs should be noted on plans as "soundproof" if maximum sound-proofing is necessary and the following specifications added: During erection of partitions all post connections, base and cornice and wall fillers shall be solidly packed with rockwool. The point where partition base and floor contact shall be sealed with felt which shall make continuous contact with floor and base. Top filler (if any) shall be solidly packed with rockwool for its entire height. All glazed partition runs shall be hermetically sealed double glass panels. To prevent sound leakage around glass, hermetically sealed double glass panels shall have all four sides of the double glass lites well sealed with putty. Automatic felt drops shall be furnished at each door.

CLEANING

All minor defects and blemishes shall be touched up neatly and finger marks removed. Cartons and rubbish shall be removed and the job left broom clean. Erection dust, washing, cleaning of glass are to be performed by user.

NIWALL TYPE - S PARTITIONS



This is a low cost full 3" thick partition available in all steel, steel and glass or open lite glass panels. Any panel or door unit may be removed and re-erected within a run without disturbing the adjacent panels or the cornice above, yet the panels are interlocked securely. Easy to erect, and easy to relocate. There are built-in wiring facilities and provisions for electrical components. Floor shoe and top panel plate are designed so that they interlock, providing tight joints and positive panel alignment.

Two applications of the National Uniwall Type "S" Partitions are indicated by the illustrations on this page. Both show a 9' ceiling high partition; one with a glass and steel combination while the other has a glass lite above doorline.

specifications

GENERAL
Completely furnish and erect National Steel Partition Company's Type "S" Steel Partitions as specified herein.

SHOP DRAWINGS
Detailed shop drawings of complete plan showing partition, layout, typical elevations, hardware schedule, finish and any special conditions and construction shall be submitted in duplicate for approval to the architect before fabrication and assembly.

ERECTION
Installation of all partition runs shall be on top of the finished flooring. All partitions shall be fitted to existing building conditions and shall be erected in a substantial and rigid manner, straight and plumb with horizontal lines level. All units shall be aligned at joints and interlocked, and floor fastenings shall be completely concealed and adjustable to floor level variations. Reinforcements shall be provided to ceiling or bracing on runs exceeding 20′ in length unsupported by cross runs.

CHANGEABILITY
Any layout change which is desired shall be easily and economically executed without debris or dirt and with 100% salvage. Partitions and doors shall be completely interchangeable with units of like size. Door units and panel units shall be interchanged without disturbing adjacent units and cornice above.

MATERIALS
Exposed steel shall be commercial quality cold-rolled furniture steel properly annealed and patent leveled with smooth, clean surfaces. All gauges of specified metal are U. S. Standard.

UNITS
For future extensions of either 2-, 3-, or 4-way, units shall be so assembled that extensions may be joined without removal of adjacent units or material above cornice line. (The partitions are to be 3″ thick, height shall be standard cornice of either 7′-5¼″, 8′-2¼″, 9′-2¼″ or ceiling heights as required.) Factory will ship all units in one assembly from floor to cornice in widths of 6″ increments not to exceed 48″ in all steel and 54″ in steel and glass. All panels of like size are to be interchangeable. All 42″ door sections will interchange with 42″ panels.

PANELS
Shall be made of two sheets of No. 20 ga. cold rolled steel. Panels shall be flush and the panel sheets proper shall be reinforced with horizontal stiffeners spot-welded on 3″ centers and these stiffeners shall be placed approximately every 12″ in the height of a sheet.

Partitions of steel and glass shall be similar to all steel except that openings for glass shall be provided above chair rail height, as indicated in the elevation.

All glass partitions shall be glazed full height within a steel panel frame. No. 20 gauge steel shall be used for the vertical glazing posts and the edges shall be formed to abut adjacent panels same as all steel. Horizontal 20 gauge top glazing members shall be self seating and telescopic within the top rail.

As an Alternate the hat shaped reinforcements may be omitted if honeycomb is substituted for rockwool.

DOORS AND DOOR FRAMES
Doors shall be made of flush design and they shall be packed with rockwool. Standard swing door with frame shall fit a 42″ wide section and the door shall be 3′ x 6′10″. Doors shall be reinforced for hinges, locks and door checks. Hinge reinforcement shall be 10 gauge, lock reinforcement 10 gauge, door check reinforcement 14 gauge. Doors shall be 1¾″ thick with 3/32″ clearance at heads and jambs.

To compensate for floor irregularities, all frames shall be fully adjustable.

HARDWARE
Shall be National's Standard.

All hardware shall be interchangeable as called for in schedule of hardware. Two 5″ x 4″ loose pin ball bearing butt hinges shall be provided for all doors.

BASE
The base shall be of flat sanitary design and made of No. 18 gauge, 6″ high with ¼″ projection, running in a continuous line on both sides of partition. To allow for normal irregularities in floor elevations, base is to be vertically adjustable. In order to allow easy access to utility spaces, base shall be made removable.

CEILING TRIM
(For those partitions that extend to ceiling.)

They shall be constructed to run over all units to ensure rigidity for horizontal bracing. They shall be provided with a lay-in type wire raceway easily accessible from either side of unit. Raceway and internal cornice to be concealed by ornamental trim of No. 18 gauge.

CORNICE
(Provided for those partitions that do not reach ceiling.)

Cornice shall run in a continuous line over top of units. No. 18 gauge rolled steel section giving maximum rigidity for horizontal bracing. They shall also be provided with a lay-in type wire raceway easily accessible from either side.

WALL FILLERS
Shall be telescopically adjustable and have no exposed raw steel edges or wall fastenings. They shall be double steel sheets with finish appearance similar to partition panels and shall be packed with glass wool.

TOP FILLER
(Omit if no top filler required.)

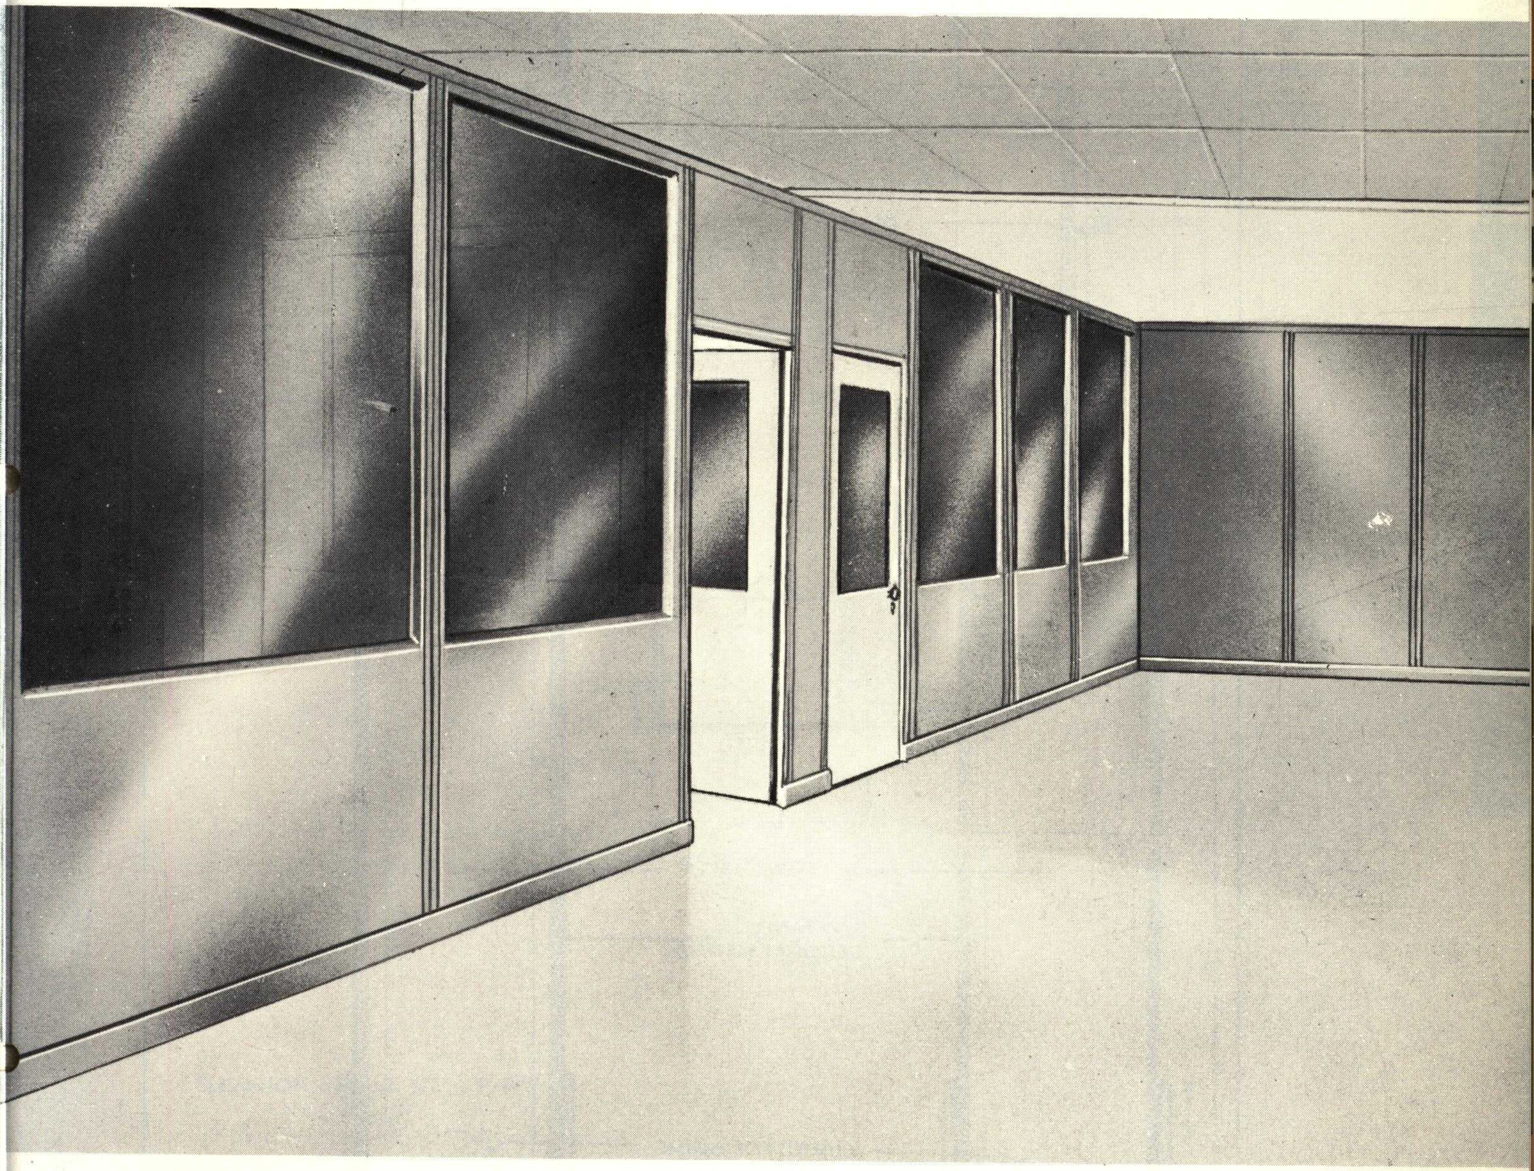
For partitions that extend to ceiling, Mineral board top fillers which are double sheet mineral board ⅜″ thick, shall be applied over studs set 24″ on center.

FACTORY FINISH
All exposed surfaces of completed partitions shall be thoroughly cleaned in a phosphate solution, rinsed with a rust inhibitor and properly dried prior to paint applications. Partitions are finished permanently with a baked urea Melamine enamel to ensure quality, durability and performance. The finish coat shall be of "eggshell" texture, uniform throughout; color shall be National Steel Partition Company's Color No. .... or color to be as selected. If base and door colors are different from partition colors specify National Steel Partitions Company Color No. ....

GLASS AND GLAZING
Glass for metal partitions shall be supplied by contractor and shall be of a quality, thickness and design as specified in drawings. As called for in specifications, glass shall be set easily into integral glazing moulds which are a part of the glass frame and puttied. Neoprene glazing strips may be used as an alternate to putty.

CLEANING
All minor defects and blemishes shall be touched up neatly and finger marks removed. Cartons and rubbish shall be removed and the job left broom clean. Erection dust, washing, cleaning of glass are to be performed by user.

DYNAWALL TYPE - D PARTITIONS



In order to make available a truly low cost, yet quality movable partition, National developed Dynawall Type "D"— the most economical partition made.

Dynawall is a field assembled system, using steel mouldings and various types of commercially available panel boards (¼" thick). Both panel faces are completely removable without disturbing adjacent panels and frames. This gives complete latitude of wiring and plumbing installation.

Panels and mouldings may be obtained in National's permanent factory-baked enamel finish or may be painted in the field.

This type of partition is particularly favored in factories, warehouses, laboratories, institutions, etc. Various combinations may be built up of glass, steel mouldings and non-metallic panels to any ceiling height. It is simple to erect and to re-locate, and is 100% salvagable.

specifications

GENERAL

Completely furnish and erect National Steel Partition Company's Type D "Dynawall" Stud Type Steel Partitions as specified herein.

SHOP DRAWINGS

Detailed shop drawings of complete plan showing partition, layout, typical elevations, hardware schedule, finish and any special conditions and construction shall be submitted in duplicate for approval to the architect before fabrication.

ERECTION

Installation of all steel partition runs shall be on top of the finished flooring. All partitions shall be fitted to existing building conditions and shall be erected in a substantial and rigid manner, straight and plumb with horizontal lines level. All units shall be aligned at joints and interlocked and floor fastenings shall be completely concealed and adjustable to floor level variations. Provision shall be made for reinforcements to ceiling or bracing on runs exceeding 18′ in length unsupported by cross runs.

CHANGEABILITY

Any layout change which is desired shall be easily and economically executed without debris or dirt and with 100% salvage. Partitions and doors shall be completely interchangeable with units of like size.

MATERIALS

Exposed steel shall be commercial quality cold-rolled furniture steel properly annealed and patent leveled with smooth, clean surfaces. All gauges of specified metal are U. S. Standard.

UNITS

Units shall be constructed in multiple widths of 48″. Door and frame section shall be interchangeable with standard panel measuring 48″. Units are assembled and built so that future extensions of either 2-, 3- or 4-way may be joined together without removal of adjacent units or the use of fillers.

PANELS

Panels shall be faced with ¼″ thick cement asbestos Board, Fiber Board, Masonite, Plywood or other material as designated on drawings. Glass frames shall be welded and shall be constructed of standard units of 20 gauge frames. Lower panels shall be approximately 42″ high with glass frames or upper panels either 44″ or 22″ high.

POSTS

Bottom of posts to have opening for wiring. Posts shall be No. 18 gauge.

DOORS and DOOR FRAMES

Doors shall be made in a flush design with No. 20 gauge 5″ wide styles flush with No. 20 gauge panels which shall deaden sound. Doors shall be reinforced for hinges, locks and door checks. Hinge reinforcement shall be ⅛″ plate, lock reinforcement 16 gauge, check reinforcement 14 gauge. Doors shall be 1¾″ thick with 3/32″ clearance at heads and jambs. Frames shall be factory welded and finished of No. 20 gauge unit type. If so designated wood doors shall be used in lieu of steel

HARDWARE

All hardware shall be manufacturer's standard and interchangeable as called for in schedule of hardware. Two 5″ x 4″ loose pin ball bearing butt hinges shall be provided for all doors.

BASE

The base shall be No. 18 gauge, 6″ high.

CORNICE

(Provided for those partitions that do not reach ceiling.)

If required cornice shall run in a continuous line over top of units. They shall be of No. 20 gauge rolled steel section giving maximum rigidity for horizontal bracing, and of hollow construction to allow for concealed wiring.

WALL FILLERS

At the end runs, adjustable wall fillers are to be used and they shall be fastened securely to wall.

TOP FILLER

(Omit if no top filler required.)

If specified, Mineral Board top filler from cornice to ceiling.

FACTORY FINISH

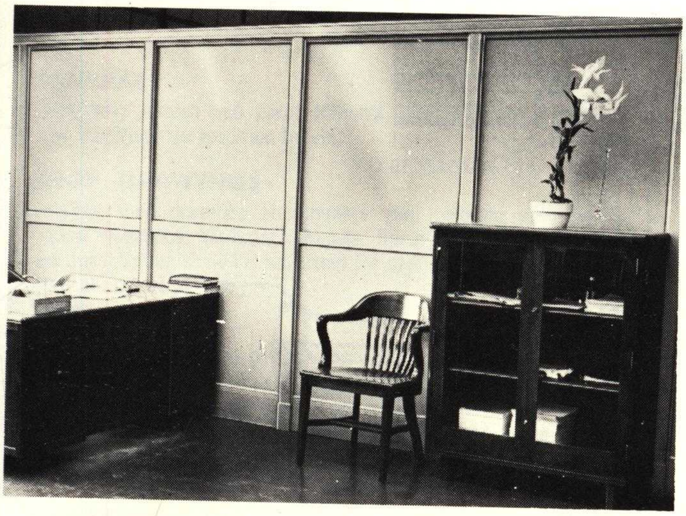
All exposed surfaces of completed partitions shall be thoroughly cleaned in a phosphate solution, rinsed with a rust inhibitor and properly dried prior to paint applications. Metal partition mouldings may either be field or factory finished. If they are factory finished they shall be painted with a synthetic baking enamel and baked so that the paint is properly prolemerized. Color shall be National Steel Partition Company's Color No. .... or color to be as selected. If base and door colors are different from partition colors, specify National Steel Partitions Company Color No. ....

GLASS and GLAZING

Glass for metal partitions shall be supplied by contractor and shall be of a quality, thickness and design as specified in drawings. As called for in specifications, glass shall be set in putty and back puttied. Putty shall be colored. Putty shall match adjacent metal work color. Glazing stops and muntins shall be applied without the use of screws or bolts.

CLEANING

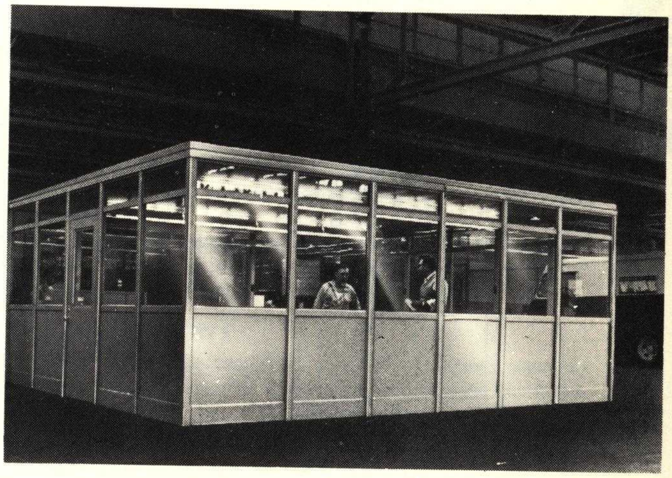
All minor defects and blemishes shall be touched up neatly and finger marks removed. Carton and rubbish shall be removed and the job left broom clean. Erection dust, washing, cleaning of glass are to be performed by user.

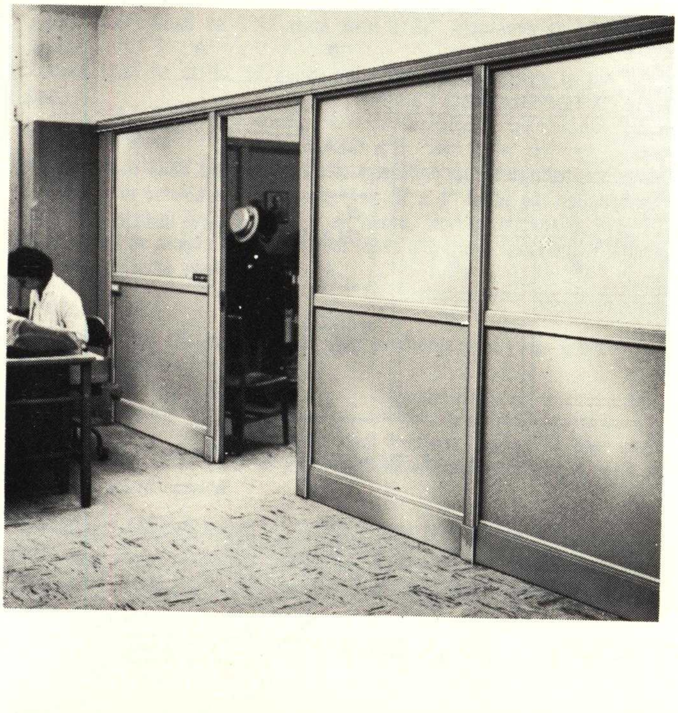


The National SM Type Partitions give the advantages of the more expensive types while keeping costs low for installation, maintenance and relocation. Panels are ⅜" thick with insulating material packed between steel sheets. Standard electrical components may be used. Provisions for wiring are available in post, base and cornice. At left, installation at Sears Roebuck, New York City. 7'-2¼" high partition, all steel open above.

The bolted construction in the SM Type Partition permits field cut-down. The 6" high hollow base provides space for pull-through wiring.

At right, installation at Brooklyn Union Gas Co., Brooklyn, N.Y. Partition is 8'-2¼" high, steel and glass with steel ceiling resting on partitions.





The SM Type Partition is designed to use a minimum number of parts, providing savings in both installation and fabrication. The 3" thick posts may be extended in all 4 directions. Adjacent panels are not disturbed.

At left, installation at Sears Roebuck, New York City. The SM Type steel and glass partition is 7'-2¼" high, with double mineral board top filler reaching to ceiling.

specifications

GENERAL

Completely furnish and erect National Steel Partition Company's SM Type Partitions as specified herein.

SHOP DRAWINGS

Detailed shop drawings of complete plan showing partition, layout, typical elevations, hardware schedule, finish and any special conditions and construction shall be submitted for approval to the architect before fabrication and assembly.

ERECTION

Installation of all steel partition runs shall be on top of the finished flooring. All partitions shall be fitted to existing building conditions and shall be erected in a substantial and rigid manner, straight and plumb with horizontal lines level. All units shall be aligned at joints and interlocked. Floor fastenings shall be completely concealed and adjustable to floor level variations.

CHANGEABILITY

Any layout change which is desired shall be easily and economically executed without debris or dirt and with 100% salvage. Partitions and doors shall be completely interchangeable with units of like size. Panel and door units may be interchanged without disturbing adjacent units.

MATERIALS

Exposed steel shall be commercial quality cold-rolled furniture steel properly annealed and roller-leveled with smooth, clean surfaces. All gauges of specified metal are U. S. Standard.

UNITS

For future extensions of either 2-, 3-, or 4-way, units shall be so assembled that extensions may be joined without removal of adjacent units or material above cornice line. The partition height shall be standard cornice of either 7′-2¼″, 8′-2¼″, 9′-2¼″ or 10′-2¼″ to top of cornice trim as indicated in multiples of 5″ in width with a maximum of 60″ for glazed units and 50″ for solid steel units.

DOORS and DOOR FRAMES

Doors shall be made flush with No. 20 gauge 5″ styles flush with No. 20 gauge pans which shall deaden sound. Standard swing door with frame shall fit a 40″ wide section and the door shall be 2′-10″ x 6′-10″. Doors shall be reinforced for hinges, locks and door checks. Hinge reinforcement shall be 10 gauge, lock reinforcement 10 gauge, check reinforcement 14 gauge. Doors shall be 1¾″ thick with 3/32″ clearance at heads and jambs.

Frames shall be of No. 18 gauge unit type and adjustable to the floor line.

HARDWARE

All hardware shall be mobile as to operation and interchangeable as called for in schedule of hardware. Two 5″ x 4″ loose pin ball bearing butt hinges shall be provided for all doors. Mortise latches in U. S. 10 finish shall be standard with cylinder locks of various functions. Finishes and designs also available.

RAILS

Shall be of No. 20 gauge, rolled steel sections, with glass grooves for chair and snap on top rails.

POSTS

Shall be of No. 18 gauge, rolled steel sections. Design of post shall permit extension of 2-, 3- or 4-way with no removal of adjacent units or material above cornice.

BASE

The base shall be No. 20 gauge, 6″ high with a 2″ high mop mould adjustable vertically to take up the floor irregularities. Plinths at each post give easy access for wiring.

CEILING TRIM

(For those partitions that extend to ceiling.)

They shall be constructed to run over all units to ensure rigidity for horizontal bracing. They shall be provided with a lay-in type wire raceway.

PANELS

Shall be made of 2-20 gauge commercial quality rolled leveled steel sheets, permanently bonded to a 5/16 corrugated filler core with resin adhesives. Panels shall be assembled by means of bolts, permitting cutting down in the field. Glass openings to be provided in upper part of panels as indicated on the elevations.

CORNICE

(Provided for those partitions that do not reach ceiling.)

Cornice shall run in a continuous line over top of units. No. 18 gauge rolled steel section giving maximum rigidity for horizontal bracing. It shall also be provided with a lay-in type wire raceway easily accessible.

POST CAPS

Caps shall be of removable type for easy wiring and disassembly. They shall be of ornamental inlay design in No. 18 gauge.

WALL FILLERS

Shall be telescopically adjustable, to take up masonry irregularities. They shall be of No. 20 gauge.

TOP FILLER

(Omit if no top filler required.)

For partitions that extend to ceiling, Mineral board top fillers which are double sheet mineral board ⅜″ thick, shall be applied over wood studs set 24″ on center.

Steel top filler of No. 20 gauge (in lieu of mineral board) shall be single flush line joints made of double steel and shall be removable. Single sheet steel top fillers of 20 gauge steel are also available.

FLOOR CONNECTIONS

All floor connections are concealed at base and all fittings shall be made below each post. They shall be provided with leveling shims for fine adjustment to normal floor irregularities. Connections are to be securely fastened to floor.

PANEL CONNECTIONS

All units proper are to be connected by No. 14 gauge clips 24″ on center that maintains unit rigidity and properly aligns connecting units. In order to permit vertical wiring, clips are provided with a wiring hole and projections for snapping on flush post cap that are to be held in place without bolts, nuts, etc.

FACTORY FINISH

All surfaces of partitions shall be thoroughly cleaned in a phosphate solution, rinsed with a rust inhibitor and properly dried prior to paint applications. Partitions are finished permanently with an enamel coat of alkyd-melamine base and baked to ensure quality and durability.

The finish coat shall be of "eggshell" texture, uniform throughout, color shall be National Steel Partition Company's Color No. .... or color to be as selected. If base and door colors are different from partition colors, specify National Steel Partition Company Color No. ....

GLASS AND GLAZING

Glass for metal partitions shall be supplied by contractor and shall be of a quality, thickness and design as specified in drawings. As called for in specifications, glass shall be set in putty.

CLEANING

All minor defects and blemishes shall be touched up neatly and finger marks removed. Cartons and rubbish shall be removed and the job left broom clean. Erection dust, washing, cleaning of glass are to be performed by user.

specifications

OVERALL DESIGN

Partitions are to be constructed of interchangeable parts of steel surmounted by glass or accoustical material as specified. All partitions shall be easily assembled and so constructed to allow partitions to be disassembled and reassembled in any formations of units required.

PANELS

Panel shall be not less than 1¾ inches thick to provide a flush design. All surfaces of panel shall be 20 gauge U. S. standard cold rolled roller leveled furniture steel. Panel shall be so reinforced and welded to insure a lifetime rigid construction.

POSTS

1¾ inches in thickness of cold rolled and welded U.S. standard 16 gauge steel. Post shall be interchangeable and each to be equipped with a leveling device to permit easy installation and compensate for unevenness in floors. When required, posts can be equipped with a floor anchor to eliminate top sway and permit easy installation of doors and gates.

DOORS

All steel surfaces shall be 20 gauge cold rolled U. S. standard roller leveled furniture steel properly reinforced to receive hardware and eliminate warpage. All doors and gates are to be factory mounted to assure easy installation and shall be shipped as a complete unit with cylinder lock, key and inside snap latch. Doors to be so constructed to permit mounting to universal post on any one of four sides.

INSULATION

Panels, doors and gates shall be insulated with a rigid material of honeycomb construction bondarized under pressure and shall provide sound absorbency and impact resistance.

BASE

Ordinarily supplied open but if closure is required, base shall be of clip type construction easily mounted and fabricated so as to permit interchangeability.

GLASS

Glass to be supplied in 3 textures, clear, broadlite and bandlite and shall be not less than 7/32 inch in thickness. Bottom and sides of glass to be set in a vinyl channel cushion – top of glass to be polished or protected with a vinyl channel as specified.

WIRE RACEWAY

A wire raceway shall be provided at the bottom of each panel to receive wiring and shall run continuously along completed installation of partition passing through posts by using openings provided.

FACTORY FINISH

All exposed surfaces of completed partitions shall be thoroughly cleaned in a phosphate solution, rinsed with a rust inhibitor and properly dried prior to paint applications. Partitions are finished permanently with an enamel coat of alkyd-melamine base and baked to ensure quality and durability.

The finish coat shall be of "eggshell" texture, uniform throughout; color shall be National Steel Partition Company's Color No.......... ...... or color to be as selected. If base and door colors are different from partition colors, specify National Steel Partitions Company Color No. ....

LABORATORY PARTITIONS

To fit the requirements of hospitals and laboratories, National constructs partitions so that all types of piping (drains, water, gas, vacuum, etc.) may be run on the exterior of the partitions. These fixtures and piping are generally hidden by laboratory furniture. Thus functionalism is secured at minimum cost.

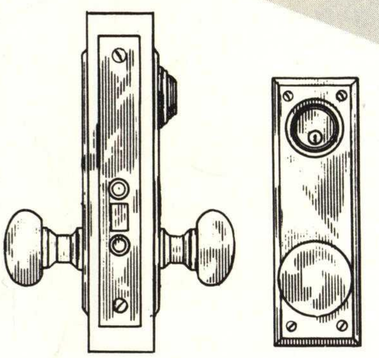
DOORS

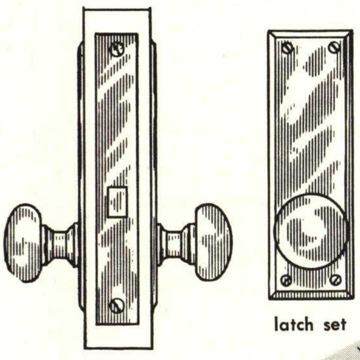
A complete range of door types are available with National Partitions. Included among these are:

Doors in Pairs, Flush Steel, Half Glass, Door Louvers, Dutch Half Glass, Dutch Half Glass, Dutch Flush Steel, Etc.

Door units are interchangeable with panel units of same size.



standard cylinder lock set



latch set

ACCESSORIES

Partitions by National are also available with wickets (Hinged or Slide), with horizontally Pivoted Transoms, and with Open Bases.

All desired accessories are available including Latch Sets, interchangeable Lock Sets of all functions, Surface Door Closers, Concealed Door Closers, etc.

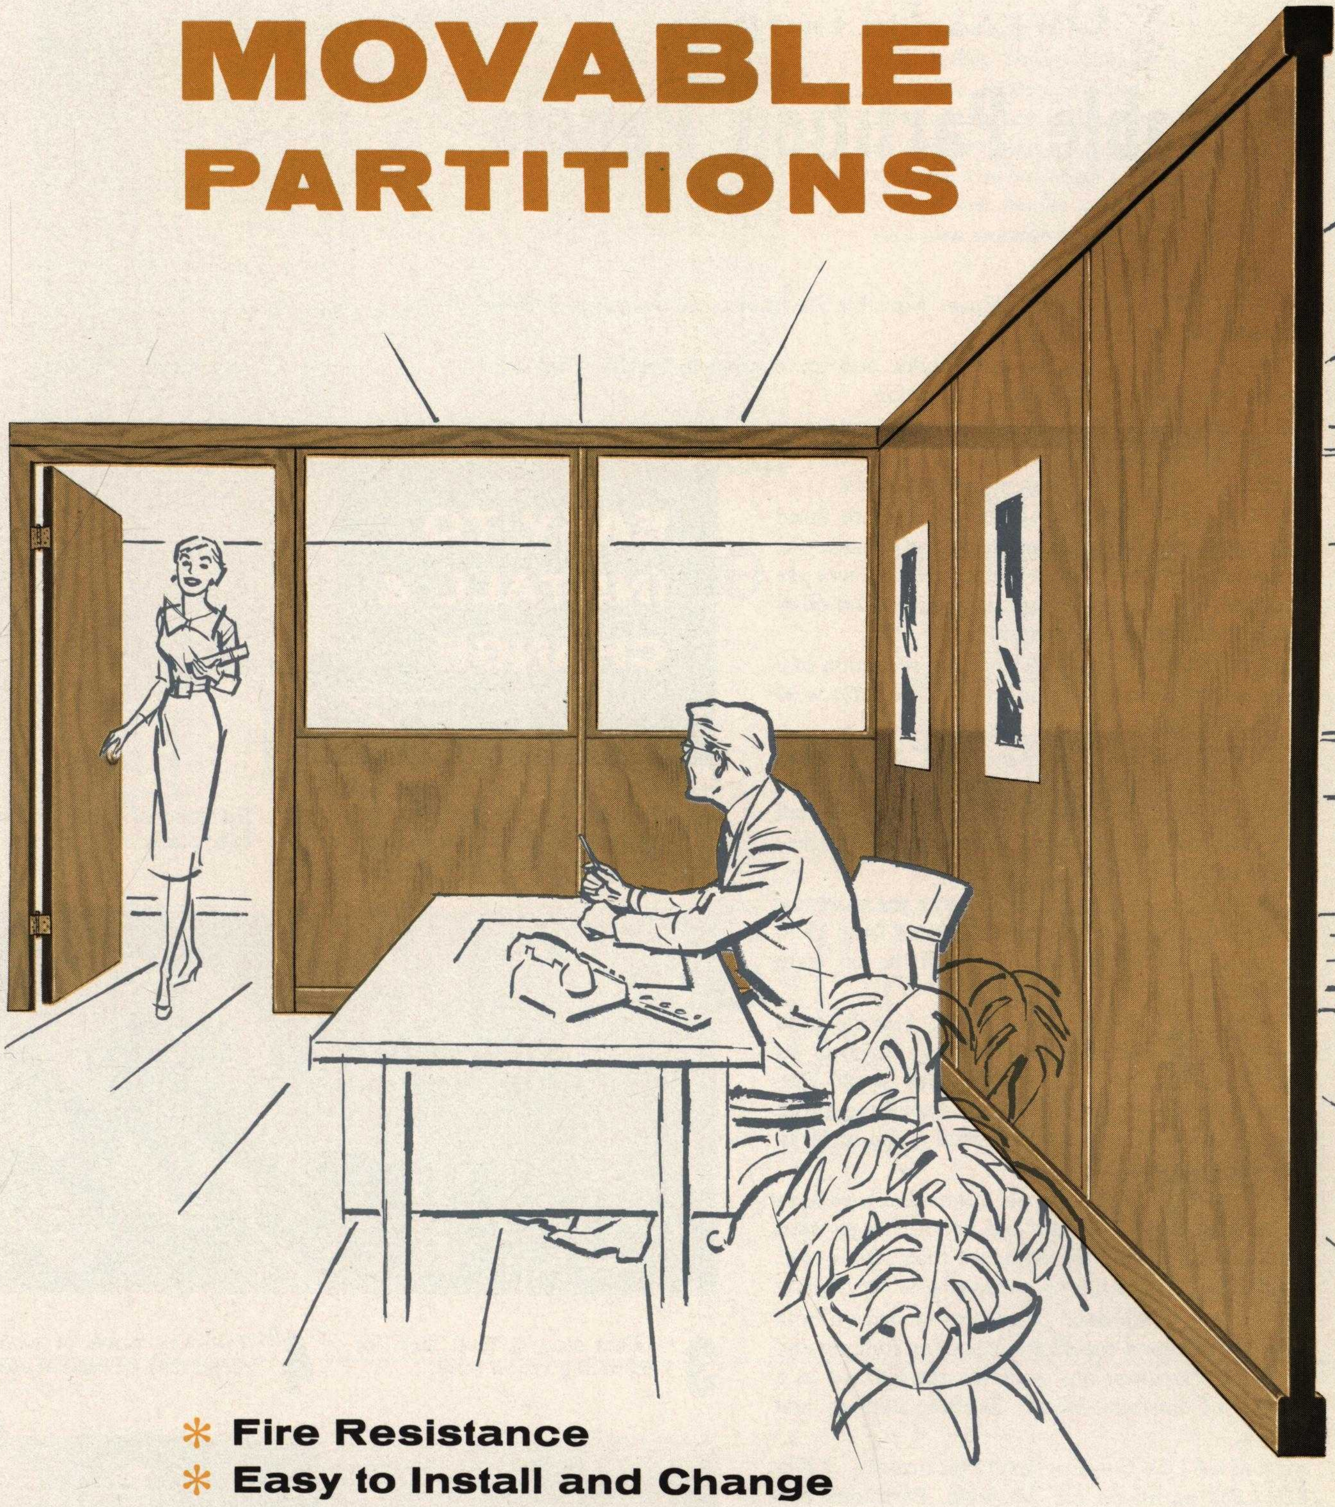
MOVABLE PARTITIONS



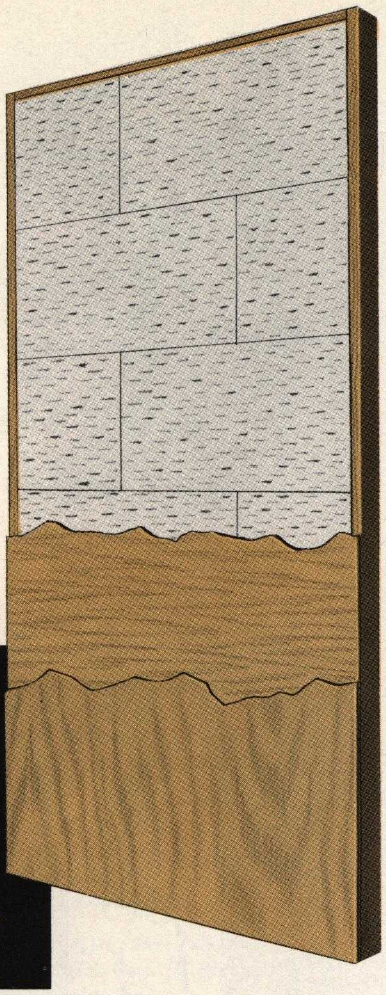
- **Fire Resistance**
- **Easy to Install and Change**
- **Natural Wood Beauty**
- **Sound Retarding**
- **Pre-Finished or Plain**

A. I. A. FILE NO. 35-H-6

Special Features of

Owens-Illinois

Movable Partition Panels



CONSTRUCTION—Owens-Illinois Movable Partitions are wood-faced, and with durable KAYLO* core.

MOVABILITY—Panels are easy, quick and inexpensive to install. They can can be changed to suit a revised floor plan.

FIRE RESISTANCE—Cores of Owens-Illinois panels are made from KAYLO* . . . a fireproof, rotproof, vermin-proof mineral core material.

NATURAL WOOD BEAUTY—Panels are faced with handsome hardwood veneers that enhance the appearance of any room or office. Birch faces are standard. Oak, cherry, walnut, mahogany and other species are available on request.

SOUND REDUCTION—The sound reduction of a panel at frequencies ranging from 137 to 2071 is 34 to 38 decibels.

LIGHTWEIGHT, STRONG—A 4′0″ x 8′0″ panel weighs approximately 100 pounds but can support an 8,000-pound distributed load with only one-half inch deflection when loaded. After unloading, there is no residual deflection.

DIMENSIONAL STABILITY—With the inorganic KAYLO* core, of a nominal density of from 19 to 22 pounds per cubic foot, there will be no warp or twist.

MINIMUM UPKEEP—Occasional cleaning and waxing keep Owens-Illinois panels, finished by craftsmen, looking newly-finished for years. Pre-finished panels require only occasional cleaning with a damp cloth. They are fade resistant, and impervious to most chemicals.

STANDARD SIZES—Panels are available in sizes up to 4′0″ x 8′0″ length and width. Larger sizes are available on request. Standard thickness is 1¾″. 1⁹⁄₁₆″ and 2¼″ partitions are available on request.

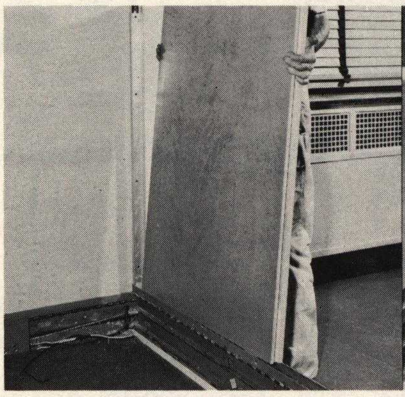
FINISHES—Unfinished panels are sanded on both sides to provide a superior surface for staining and finishing. Partitions are available pre-finished in a variety of finishes—blond, natural, nutmeg and pastels.

PRE-SEALING—For extra economy, PRE-SEALED partitions are available. Partitions pre-sealed by either the PB-101 or PB-202 process preserve natural wood beauty and require only a final finish coat on the job.

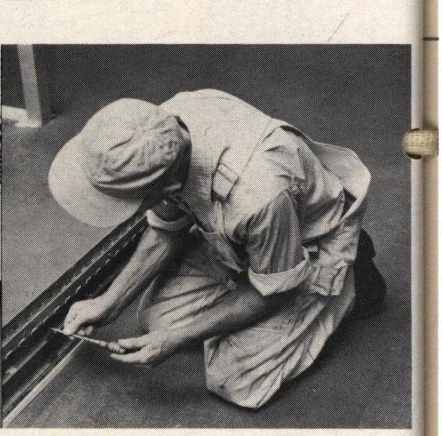
*KAYLO is an incombustible mineral core manufactured by Owens-Corning Fiberglas Corp., Toledo, Ohio.

EASY TO INSTALL & CHANGE ▽

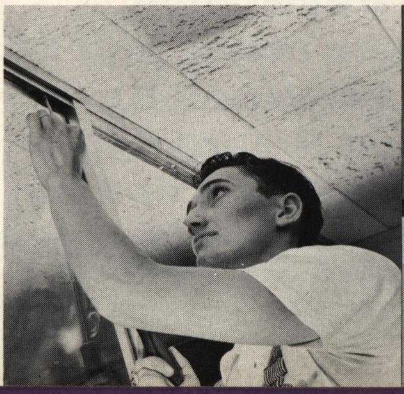
1 Install base plate with or without conduits for electric and phone cables as needed.



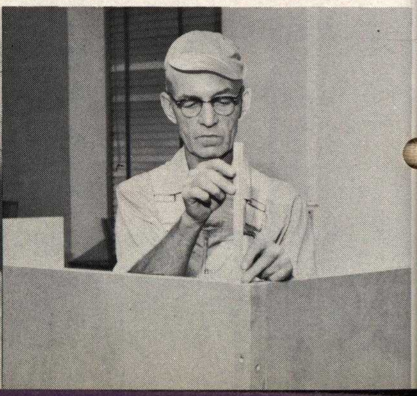
2 Fit base of panel to top of base plate.



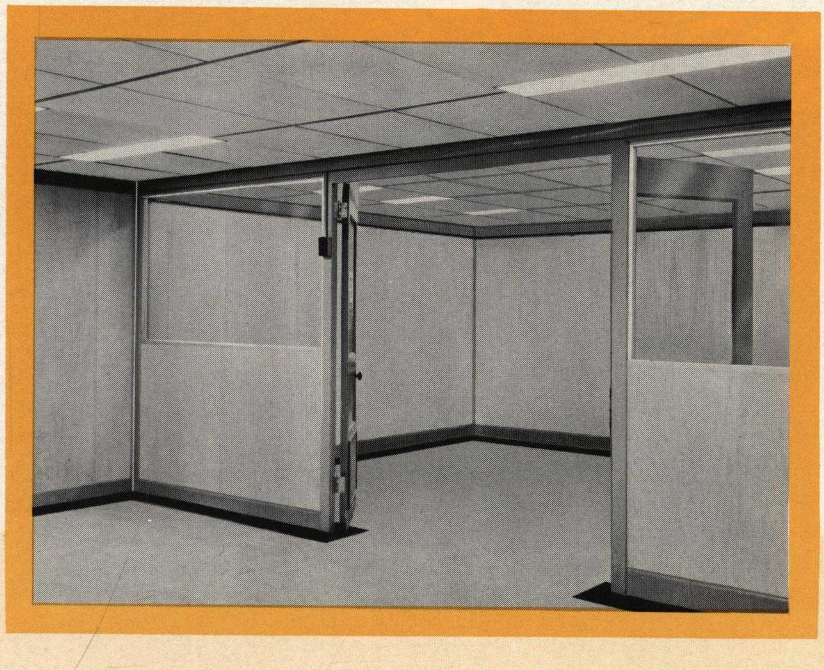
3 Glass stop is final step for installing vision strip.



4 Two-way posts of wood or metal may be used at corners.



TYPICAL INSTALLATION DETAILS



There are many methods of installing Owens-Illinois partitions. Since individual panels are made without special end milling, they are adaptable to all systems. You will want to modify or change their details to suit your own requirements.

OWENS-ILLINOIS PLYWOOD MOVABLE PARTITIONS

Suggested Specifications

GENERAL—Partitions where indicated on plans shall be Owens-Illinois Plywood Movable Partitions as manufactured by Owens-Illinois Plywood Company, North Troy, Vermont.

WORK INCLUDED—These specifications are intended to include complete installation of flush movable partitions as indicated on the plans. Shop drawings shall be submitted by the contractor to the architect for his approval and shall show details of construction, partition layout, hardware schedule, and finish where required. Copies of these drawings shall be furnished the General Contractor.

GENERAL REQUIREMENTS

1. DIMENSIONS—Partitions shall be 1¾″ standard thickness as shown on specifications. Other thicknesses on request. Maximum widths shall be 4′ and maximum heights shall be 8′. Larger sizes on request.

2. FLEXIBILITY—Additional units may be added without removing existing units. Panels shall be so installed that they may be moved or changed with a minimum of expense and effort.

3. INSTALLATION—All panels shall be flush and interlocked at panel joints and at door joints. Partitions shall be straight, plumb and true with horizontal lines level and shall be rigid and substantial. They shall be installed on top of the finished floor or carpet. Floor fastenings shall be concealed by a base plate (here specify wood molding, rubber, metal or other base cover plate) and shall be scribed to the floor. Ceiling attachments shall be concealed by wood, metal or other (here specify molding) type of molding. All partitions over 16 feet in length shall be reinforced to the ceiling or other bracing where these partitions are not supported by cross partitions, so as to provide additional rigidity. Ceilings shall be sufficiently rigid to withstand lateral thrust on panels.

4. ELECTRICAL PROVISION—Provisions shall be made for wiring and outlet space in the base, and posts. The installer shall provide cut outs for outlets in the partitions.

MATERIALS—Panels—Panels shall be Owens-Illinois Plywood Movable Partitions with KAYLO* core and manufactured by the Owens-Illinois Plywood Company, North Troy, Vermont. The face veneer shall be of high quality veneer (specify species and paint or stain grade or pre-finished here). All panels shall be edgebanded with 1⅜″ kiln-dried hardwood or softwood resin glued to the KAYLO* core.

EDGES—Standard panels have square edges; however, edges can be machined to suit job requirements.

DOORS—Doors shall be 1¾″ Owens-Illinois B-Label Fire Doors or D-S Fire Resistant Doors. Doors shall be hung with 1⁄16″ clearance at jambs and heads.

The base shall be continuous on both sides of the partition. Construction shall be of wood matching the panel veneer (alternate: rubber or metal). It shall be removable from either side to allow access to wiring.

The cornice shall run continuously on top of floor and ceiling panels and shall be of wood or metal matching the partition. Joints shall be staggered on both sides.

Top and end fillers where required shall be Owens-Illinois panels extending to the ceiling. Construction shall be wood matching panel faces.

FINISH—Faces of unfinished panels and all exposed wood parts shall be stained or filled to specifications or panels may be pre-finished as specified and all molding and trim stained or filled to match the factory finish.

*KAYLO is an incombustible mineral core manufactured by Owens-Corning Fiberglas Corporation, Toledo, Ohio.

FRAMED IN LIGHT MODERN ALUMINUM

The system of interior partitioning that achieves beauty and versatility through STRUCTURAL SIMPLICITY

Panel-Matic INC.
528 BUTTERWORTH ST., S. W., GRAND RAPIDS, MICHIGAN, GL9-6733

SPECIFY *Panel-Matic* FOR BEAUTY,

EXCLUSIVE
STRIP-CLIP*
THE KEY TO PANEL-MATIC SIMPLICITY

A ¾″ wide strip of extruded aluminum, anodized to harmonize with the partitions selected, is clipped on both sides of the panels joining them in perfect alignment. The Strip-Clip provides electrical raceways; accepts all necessary electrical outlets, making it unnecessary to "wire up" a partition panel, which limits panel's re-use.

*Patent Pending

BEAUTY Panel-Matic partitions create the warmth and formality of fine panelling—classic and timeless in beauty—made contemporary through the subdued use of anodized aluminum framing.

VERSATILITY Only Panel-Matic offers such a wide variety of interchangeable panels; fine wood veneers, steel, hardboard, plastic, glass, acoustical.

SIMPLICITY Panel-Matic's patented strip-clip system of using only one standard part to join panels insures perfect vertical alignment—ease of installation—ease of change.

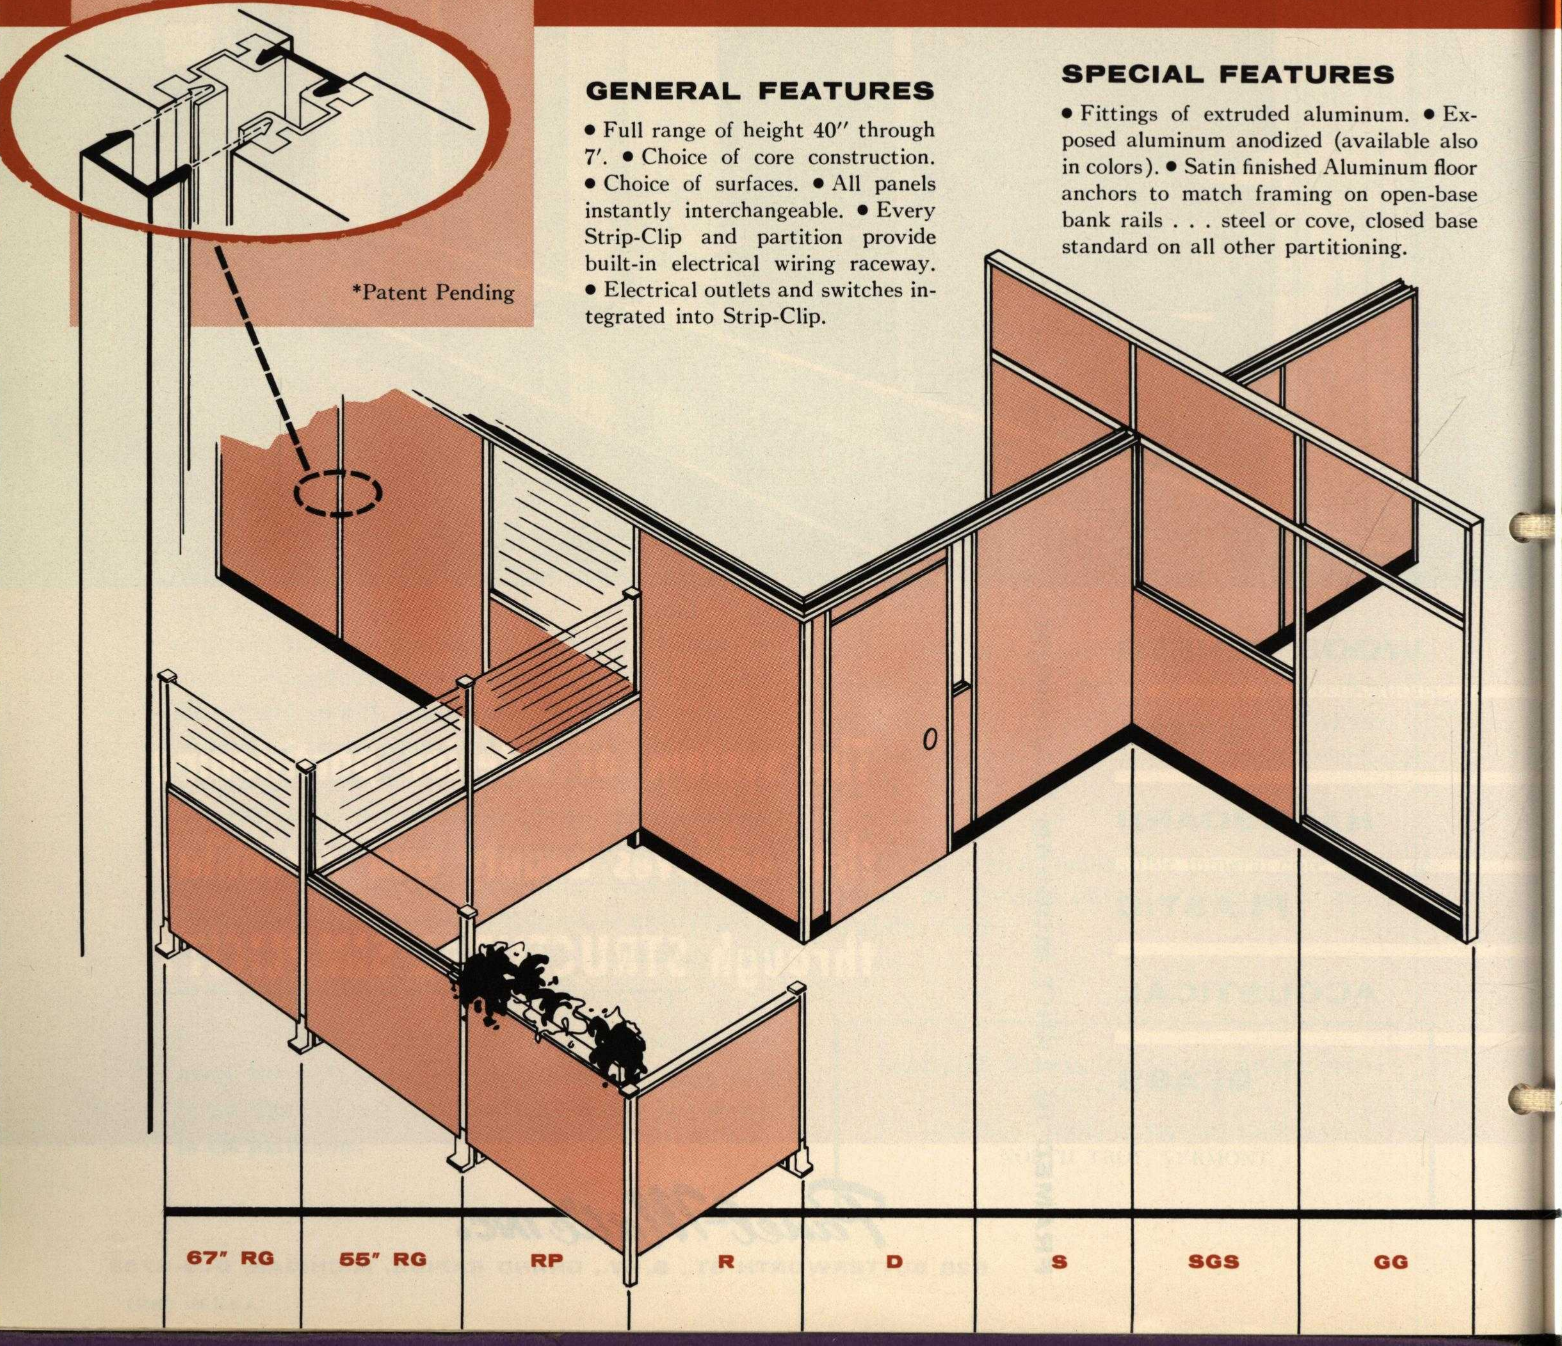
ECONOMY Because of the beautiful simplicity of the Panel-Matic design, substantial savings are realized in their purchase and application. They cost less to use . . . give more satisfaction.

GENERAL FEATURES

• Full range of height 40″ through 7′. • Choice of core construction. • Choice of surfaces. • All panels instantly interchangeable. • Every Strip-Clip and partition provide built-in electrical wiring raceway. • Electrical outlets and switches integrated into Strip-Clip.

SPECIAL FEATURES

• Fittings of extruded aluminum. • Exposed aluminum anodized (available also in colors). • Satin finished Aluminum floor anchors to match framing on open-base bank rails . . . steel or cove, closed base standard on all other partitioning.



VERSATILITY, SIMPLICITY, ECONOMY

Attractive, semi-private work stations of glazed 67″ RG, Panel-Matic, rail partitions, azure blue finish.

Panel-Matic standard wall partitions showing types S & SG with type SS in background creating supervisory offices in architectural firm.

PARTITION TYPES

LOW RAIL TYPES

R	43″ height with continuous aluminum rail. Corner and end post caps.
RP	Same as type "R" above except aluminum planter box replaces continuous aluminum rail.
RG	43″ height panel with posts to overall height (specify 55″ or 67″). Top edge of glass to be ground.
RF	Same as above except glass replaced by filler: corkboard, chalkboard, pegboard or Acoustifoam panel.

WALL TYPES

S	Full panel above base to cornice (standard height 7′2″; maximum 8′2″ height).
SS	Type "S" with matching panel above cornice to ceiling.
SSG	Type "S" with glass panel above cornice to ceiling.
SSF	Type "S" with filler panel above cornice to ceiling.

GLASS TYPES

Glass to be set with aluminum glass stops without use of putty or screws.

SG	Panel to have glass opening from 43″ above floor to cornice. (Standard height 7′2″ maximum 8′2″) (Hand and speak hole, deal plate, sliding glass, counter or 54″ sill height available).
SGS	Type "SG" with solid panel above cornice to ceiling.
SGG	Type "SG" with glass panel above cornice to ceiling.
SGF	Type "SG" with filler panel above cornice to ceiling.

FULL GLASS TYPES

G	Full glass lite from 6″ above floor to cornice (Standard 7′2″; maximum 8′2″).
GG	Full glass with glass above cornice.
GF	Full glass with filler above cornice.
GS	Full glass with solid panel above cornice.

FILLER TYPES

Same as glass types listed above except fillers to be other than glass. Specify hardboard, pegboard, plywood, Acousti-foam corkboard or chalkboard. Standard 1/4″ thickness; others to 3/8″ as available.

SF	Panel to have filler opening from 43″ above floor to cornice. (Standard height 7′2″; maximum 8′2″) (54″ sill height available).
SFS	Type "SF" with solid panel above cornice to ceiling.
SFG	Type "SF" with glass panel above cornice to ceiling.
SFF	Type "SF" with filler panel above cornice to ceiling.

DOOR SECTIONS

D	Manufactured to module, actual door opening 3′0″ x 6′8″ standard. Other sizes available. Glass lite panels available within door section.

SPECIFICATIONS

1. Scope of work:

Furnish and erect complete movable partitions as manufactured by Panel-Matic Inc., Grand Rapids, Michigan, in type(s) as indicated on the plans and specified hereunder. Submit drawings and schedules for approval.

2. Framing method and materials:

Partition panels will contain vertical recessed aluminum member to receive aluminum Strip-Clip for joining adjacent panels. Any unit shall be readily removable without disturbing adjacent units, and any door or panel unit of like size shall readily interchange. Desired changes of layout shall be made easily, quickly and economically without dirt or debris. Units shall be designed so that extensions in 2, 3, or 4 ways may be made quickly at any post. The partitions shall be without exposed bolts, nuts, rivets, or screws. All exposed aluminum including wall channels, horizontal rails, etc. to be anodized natural satin finish. (Specify color schedule, if desired.)

3. Panel type(s): (use as required)

—Type AW Wood panels where indicated on plans, to be flush 1¾″ thickness as shown. Panels shall be faced with (specify 1/8″ Birch, Mahogany, Walnut or other) furniture finished with highest quality rubbed-effect lacquer.

—Type AM Steel panels where indicated on plans, to be flush 1¾″ thickness, faced with 24 gage cold rolled stretcher leveled steel, primed and finished with highest quality low baked, catalized enamel in color(s) to be selected.

—Type AH Hardboard; where indicated on plans, to be flush 1¾″ thickness, faced with 1/8″ tempered hardboard, primed and finished with highest quality, low baked, catalized enamel in color(s) to be selected. 1/4″ Acousti-foam material to be used where indicated on plans, to be surface applied for maximum in-room sound conditioning.

4. Panel construction:

Panel core, skin and frame to be pressure laminated to form an integral panel unit for maximum strength. Reinforced core to be approved honeycomb construction.

5. Partition types:

To be as listed and specified herewith (and/or as shown on drawings). (Qualify types to be used).

6. End Fillers at Wall: (if used)

To be of same material as adjacent panels such as can be cut to meet wall and window conditions. Aluminum wall channel to include inorganic compression strip to seal wall irregularities.

7. Base: Closed type (if used)

Partition panels to have leveling legs located by groove in base strip. Base strip to be fastened to finish floor. Closed base of tempered hardboard or steel (rubber or vinyl cove base available) to be removable for access to wiring space. (Standard 4″ height or 6″ available).

8. Doors and Frames:

Furnish 1⅜″ (or 1¾″) hollow core wood (or hollow metal) flush doors in types and sizes per door schedule, and in color(s) to be selected. Manufacturer's standard Yale latch or lock set, 1 pair Stanley butts to be furnished.

9. Electrical Provisions (if used):

Partition contractor to furnish standard Carlings 220-A-BL, 215-A-BL switch and receptacle fittings for use in panel-matic aluminum sections and base material. Wiring and installation to be by electrical contractor.

36 DECORATOR COLORS

No longer is there any need for drab, depressing and uninspiring office and service partitions. Space panels created by Partitions, Inc. offer a minimum choice of 36 of the newest decorator colors in a wide range of paneling materials which includes porcelain steel, Formica, wood veneer, novoply, duraply, cement-asbestos, tenex and sheet rock.

PARTITIONS ONLY 1½-INCH THICK

There are no unsightly, awkward and space-consuming projections in space panels engineered by Partitions, Inc. The streamlined 1½-inch thickness of the frames permits the greatest possible utilization of office and service space.

PRE-FABRICATED

Panels are completely pre-fabricated at the factory, using the paneling material of your choice in the decorator colors you want—or panels can be furnished unpainted, to be finished at your convenience after installation.

ANODIZED ALUMINUM

All frames are engineered to a fine precision from heat-treated extruded aluminum, anodized to remain permanently beautiful and provide lifetime service without maintenance.

TROUBLE-FREE INSTALLATION

Partition panels are interlocked on the job quickly and easily, with no interruption or disruption of business . . . no trimming, no sawing, no fitting, no glazing, no hammering.

FLEXIBILITY OF DESIGN

There is no limitation in the location of the horizontal mullion members in the frame. Your own choice determines where they shall be placed to suit your own decorator requirements.

SPACE PANELS WITH A FUTURE

This budget-minded partitioning system provides the ideal solution to changing space requirements because individual panels can be re-arranged quickly and without bother and expense.

SPACE PANELS

Manufactured by Partitions, Inc.

TRADEMARK

SUGGESTED ARCHITECTURAL SPECIFICATIONS

1. **GENERAL:** Furnish and erect SPACE PANELS designed and manufactured by Partitions, Inc., West Chester Pike, Edgemont, Pennsylvania.

2. **SHOP DRAWINGS:** Drawings shall be furnished showing layout, typical elevation, door schedule and related data for approval by architect before starting fabrication.

3. **MATERIALS:** All framing members shall be 6063-T5 extruded aluminum and anodized for permanent, maintenance-free finish. All framing members shall be 1½″ wide to gain maximum usable space.

   Paneling shall be of any approved building materials up to ⅜″ thick as required to obtain desired appearance and economy. Porcelain steel, formica, wood veneer, novoply, duraply, cement asbestos, tenex and sheet rock are typical recommended paneling materials.

4. **UNIT PANEL CONSTRUCTION:** Each unit SPACE PANEL shall be a pre-assembled complete unit consisting of two (2) vertical half-posts having alternating male and female panel locking hardware and screwed to a suitable number of horizontal mullions, thus forming a rectangular structure having a self-contained channel to accept and completely enclose the glass and/or paneling.

   Glass and paneling shall be separated from contacting framing members by a vinyl channel all around to absorb shock, deaden sound and to compensate for variations in paneling and glass thickness.

   Panel locking hardware shall be of a double-wedge design to provide both lateral and vertical alignment to facilitate joining of panels and to maintain positive constant locking pressure between panels. When locked to adjoining panels, each half-post shall become a full-post 1½″ square.

   Vertical location of intermediate horizontal members shall be variable or capable of elimination where specific architectural effect is required or desired.

5. **OPEN BASE SPACE PANELS:** The glass and/or paneling in the 40″, 54″, 68″ and 7 foot heights shall be enclosed at the top with the 1½″ square horizontal mullion, and shall be finished with a continuous extruded aluminum cap. Each half-post of finished unit shall have alternate male and female floor anchor castings which, when panels are joined, shall interlock and provide for two (2) screws to secure each post to the floor for maximum rigidity.

   Leveling shall be accomplished with extruded aluminum shims shaped to match the contour of the floor anchors.

6. **FLOOR-TO-CEILING SPACE PANELS:** These shall be either a continuous single unit panel from floor to ceiling or a unit panel 7-ft. high consisting of desired glass and/or paneling and having provisions for a double mineral board filler above to ceiling.

   The double mineral board filler units shall have a continuous extruded aluminum cornice at the top of the partition which shall receive two (2) sheets of ⅜″ mineral board and 2″ x 2″ wood framing and shall provide a concealed raceway for electrical wiring.

   Floor base channel formed by cover angles and bottom horizontal mullion shall provide for wire raceway and to receive electrical outlets.

   A hollow 1½″ square post shall be provided at doorways to receive electrical switches and wiring. Leveling shall be provided by 1¾″ x ⁵⁄₁₆″ screw at bottom of each vertical post.

7. **DOORS AND DOOR FRAMING:** Doors shall be 1⅜″ thick hollow core wood. Door frames shall be completely pre-assembled including transoms where required and shall be provided with male and female panel locks to lock to adjoining regular panels. Door jambs shall be pre-fitted and fastened to door frame complete with concealed butt hinges and latch striker plate so that fitting up of doors during erection is not required. Door jambs shall be provided with recess to accommodate an acrilan pile strike seal.

PENMETAL MOVABLE INTERIOR

Copyright 1959, Penn Metal Company, Inc.

PARTITIONS combine rich beauty with structural stability and efficient sound control. Although designed for permanent use, they can be readily dismantled and re-erected, in a new location, to suit changed floor-plan requirements. Low initial cost, reduced maintenance and easy movability, with complete salvage of all parts, result in long-term economies.

These interiors are designed around a single modular framing system to which can be attached a wide variety of panels, providing finishes for practically any decor. Only a few standard parts are required to create any of the handsome, yet utilitarian, partitions illustrated in this catalog.

They permit a free hand in planning distinctive interiors for executive, general and factory offices; for commercial and public buildings; for stores, theaters, hotels, hospitals, schools, banks. In fact, they are adaptable to an endless variety of new, modern interiors—in either new construction or in modernization.

Penmetal movable partitions are a product of Penn Metal Company, Inc., for ninety years a leader in the manufacture of Metal Lath, Steel Framing and Expanded Metals. All framing members, steel panels and partition accessories are produced in a new, modern plant where automatically controlled manufacturing procedures insure the uniformity and precision so necessary in a high-quality product.

Service is nation-wide. Carefully selected distributors, located in principal cities, provide complete engineering and erection service. Ample warehouse stocks enable them to make installation without delay.

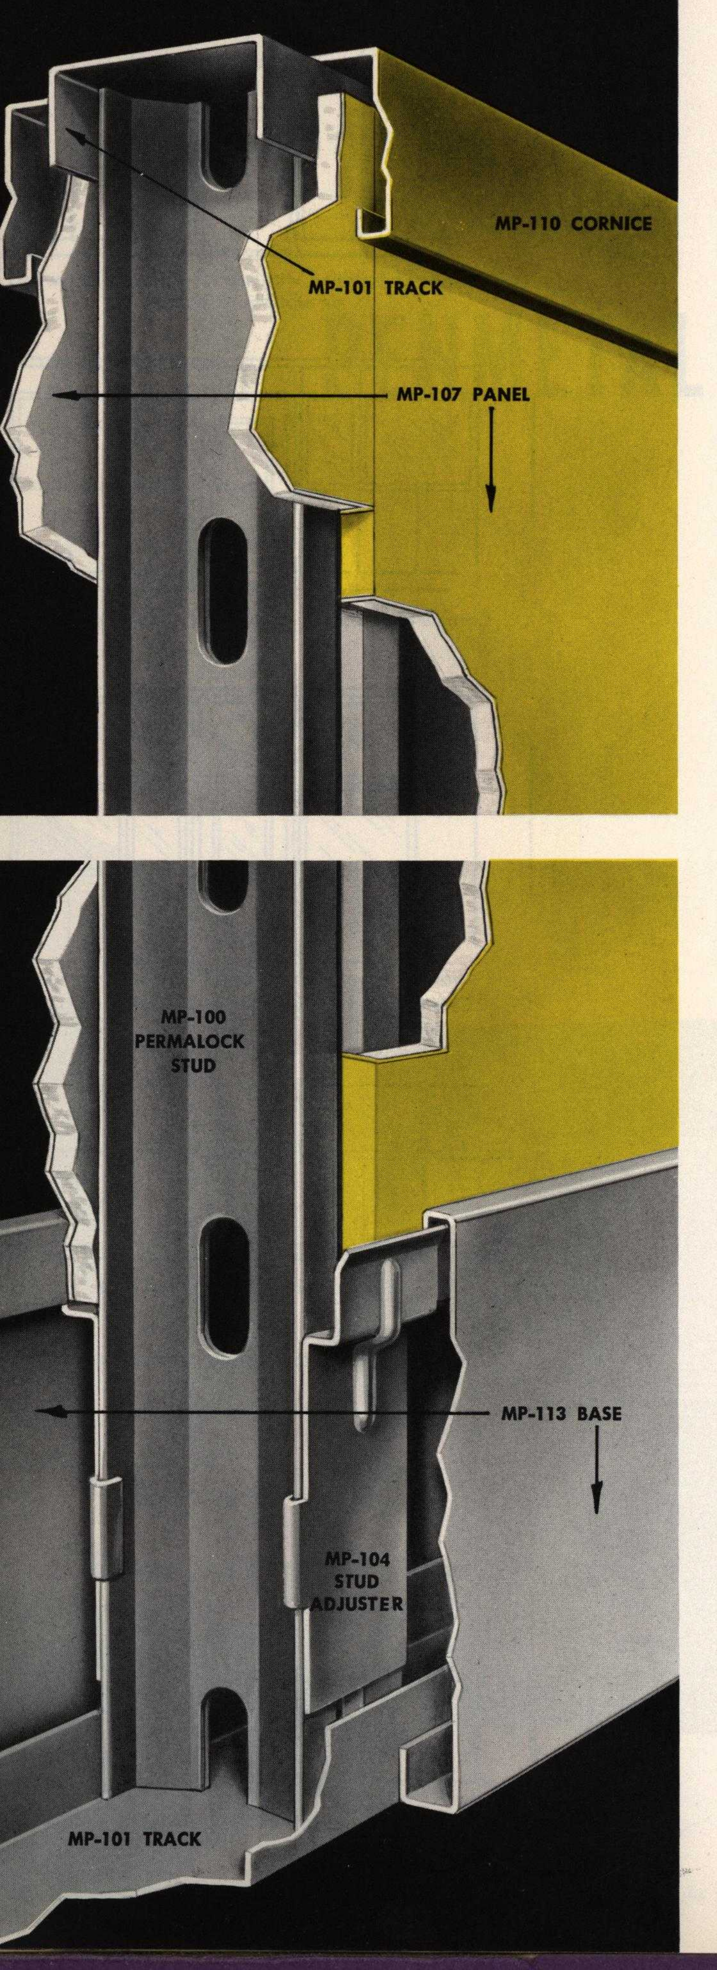
DESIGN SIMPLICITY



Penmetal® movable interiors have a single framing system for the attachment of various types of paneling. The paneled surfaces on each side of the partition are flush, from floor to ceiling, with only hairline joints. There are no visible posts to detract from the smooth flowing lines.

As all units are standard, they are interchangeable. Hence individual panels may be quickly and easily removed without disturbing other panels. Because panel widths correspond to door sections, doors may be placed wherever desired in the room plan.

The dead-air space between the panels acts as an efficient thermal barrier. If required, this space can be filled with insulating wool to increase the insulation value of the partition. The hollow center can also be used for the concealed passage of wiring and piping.

FRAMEWORK

Heart of the framing system is the Permalock stud, which has been job-proved over a period of years. These 2½" steel members are formed so that panels can be readily and securely attached to them. Stud faces are wide to provide maximum strength and bearing surface for panels. Permalock studs have passed impact tests required by the *Bureau of Standards and Appeals* of New York City.

Each stud fits into a stud adjuster, which acts as a leveling bracket to assure "one line" joints regardless of floor variations. These stud adjusters also support the panels and provide clips for securing the base. Track sections, for both floor and ceiling, are sized to fit over the flanges of the studs. Bridging members are accurately made to assure correct stud spacing, and reinforce the partition structure.

Other parts of the system, such as cornices, inside and outside corner panels, and vertical end panels, are all designed for fast, simple assembly.

All parts are electro-galvanized or painted to prevent corrosion. Permalock studs are galvanized steel. Panels and fittings are Parkerized and coated with enamel, baked on.

Cut-away view of top and bottom sections of steel-paneled partition.

STEEL PANELING

Penmetal Steel Panels consist of 20-gage, surface-stretcher-leveled, steel sheet with ¼" sound-deadening insulation board bonded to the panel steel. Vertical edges are designed to snap into the Permalock studs. Bottom edges are supported by the stud adjusters.

With panels attached to both sides of the studs, the thickness of the finished partition is only 3". As this is less than the thickness of most movable partitions, important savings in floor space result when Penmetal interiors are used.

These attractive panels are available in a wide range of smart and distinctive decorator colors. A single color or a combination of compatible colors can be selected to achieve the desired result.

The baked-enamel finishes are applied at the factory over a rust-resistant base. These beautiful surfaces will not crack, chip or craze with time, and they will never need repainting. The only maintenance required is an occasional washing with a mild solution of soap and water.

WOOD PANELING

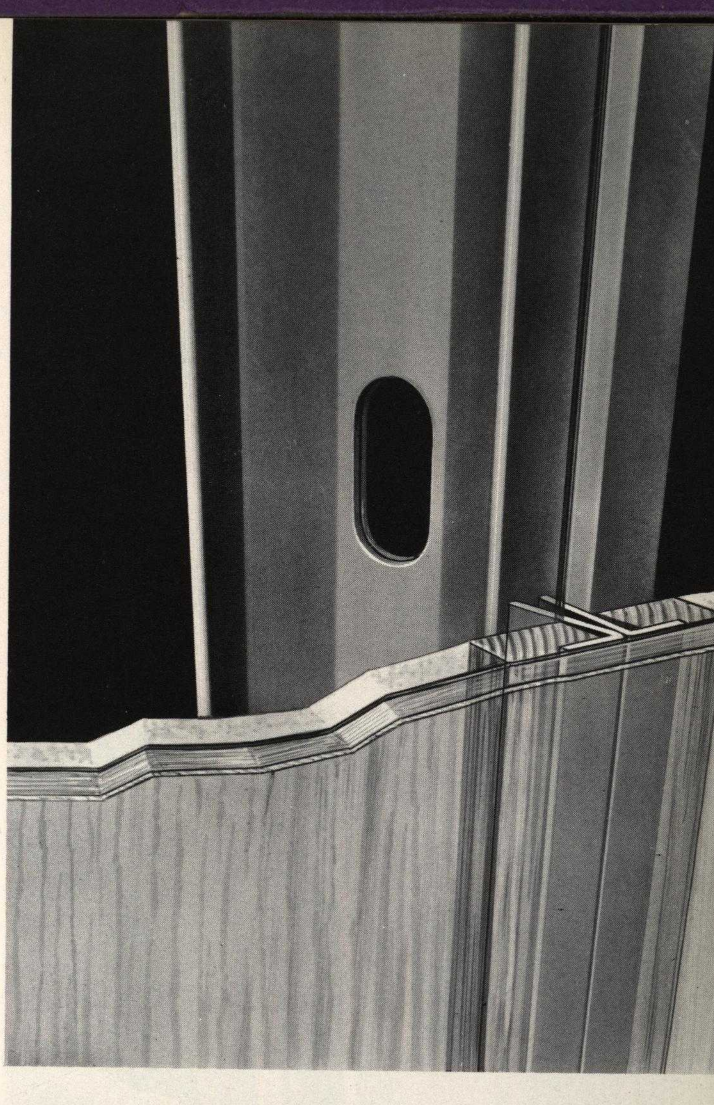
As many executives prefer a wood-paneled office, the Penmetal system provides for this. The interior can be paneled in rich attractive hardwoods; the exterior can be finished in steel to blend with other, adjacent partitions.

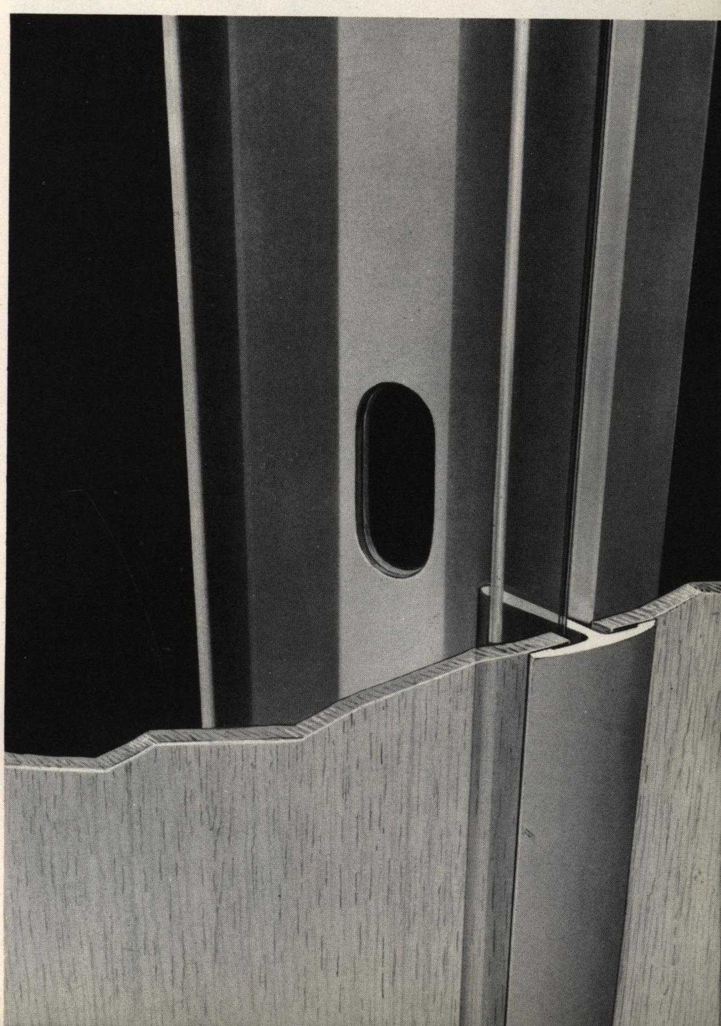
Plywood and hardwood panels in ¼" and ⅛" thicknesses respectively may be used. Panels should be applied as 24" widths. To the back of the paneling, ¼" sound-deadening insulation may be attached so that the panels present a butt-joint appearance within the room. This is accomplished by attaching, by glue or nails, angle panel attachment MP-144G. To the back of this, insulation board may be attached. The steel flanges of the angle snap into the Permalock studs, holding the panel securely in place.

An alternative design uses standard ¼" or ⅛" panels, 24" in width, without the insulation board and angle attachments. Attachment is by means of aluminum battens that snap into the stud and cover the joint between adjacent panels. This method of attachment is similar to that used for wallboard partitions.

WALLBOARD PANELS

Wallboard panels are attached to the studs by means of Kwik-Klip[*] batten strips. The batten strip is used where two panels butt against each other over the flange of the stud. The batten strip slips into the attachment groove of the stud, and, by friction,



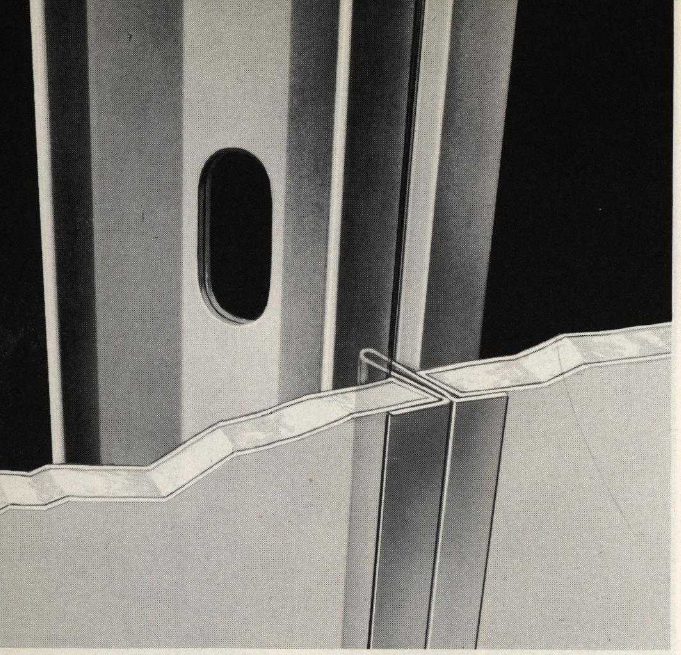


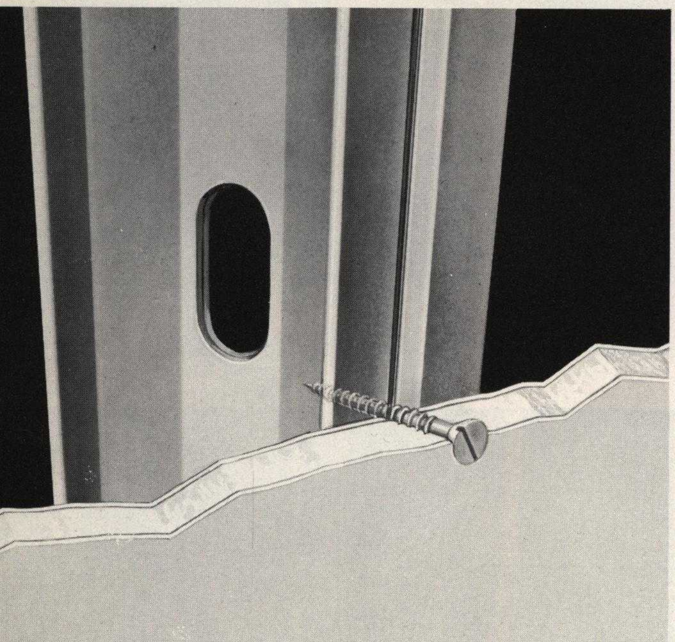
UPPER ILLUSTRATION: Plywood panels, with insulation board, fastened to stud by angle panel attachment MP-144G.

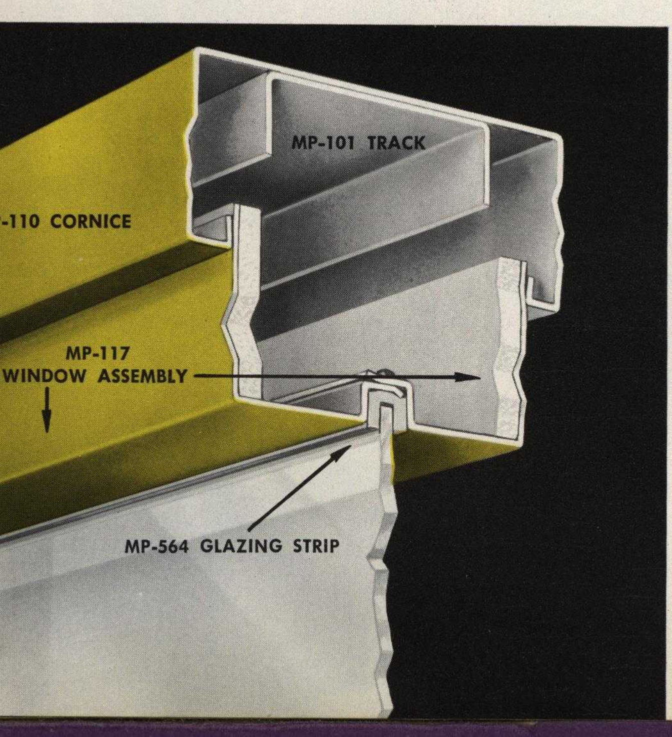
LOWER ILLUSTRATION: ⅛" hardwood panel attached to the stud by aluminum batten strip MP-145.

---

[*] Trade mark registered; patent applied for..







holds the panel securely in position. The lower edge of the wallboard is supported by the stud adjusters, and the top edge is held in place by the cornice.

When standard wallboard sheets, in 4′ widths, are specified, batten strips are used only at alternate studs. Attachment to the intervening studs, at the centers of the sheets, is by screw. The screws are countersunk below the panel surface, and the indentations are spackled to provide a smooth finish with the face of the wallboard. When 2′ wallboard panels are employed, batten strips are used at each stud.

Attachment of metal base is the same as for steel-panel partitions. When rubber or plastic base is called for, stud adjusters are not used. Instead, the wallboard panels rest on the floor, and the base is glued to the face of the panel.

PARTITIONS WITH EXPANDED METAL

For industrial plant stockrooms, tool rooms, etc., where free circulation of air and protection of room contents are both required, Penmetal expanded metal can be used in place of glass windows in the movable partitions. The expanded metal can be welded to the window frame or held in place with a special Penmetal vinyl extrusion. A variety of mesh sizes is available.

CONCEALED UTILITIES

Because the partitions are hollow, and the studs are furnished with regularly spaced, punched openings, the space between the panels can be used for the passage of wiring and piping. This permits the placement of outlets and switches at any convenient position, either horizontally or vertically.

PARTITION HEIGHTS

Given below are heights of the different types of partitions available.

Type of Partition	Partition Height
Standard Railing	44⅞″
Glazed Railing	44⅞″ plus 24″ glass
Cornice High (Solid Steel or With Windows)	7′0″, 8′1″ 9′1½″, 10′2⅝″
Ceiling High	As required*

** Maximum steel-panel height is 10′; for heights above 10′, filler panels may be used above the cornice. Maximum height for wallboard partitions is 12′.*

UPPER ILLUSTRATION: Two wallboard panels fastened to a stud with Kwik-Klip batten strip MP-120G (patent pending).

CENTER ILLUSTRATION: Centers of 4′–wide wallboard panels are screwed to stud. Screw sets below surface and indentation is spackled with wallboard cement.

LOWER ILLUSTRATION: Cut-away view of top section of 7′ steel-and-glass partition.

PARTITION THICKNESSES

The following tabulation shows the overall thicknesses of Penmetal movable partitions with various types of panels.

Type of Panel	Partition Thickness
Steel with insulation board	3″
⅛″ hardwood	2¾″
⅛″ hardwood with insulation board	3¼″
¼″ plywood	3″
¼″ plywood with insulation board	3½″
½″ wallboard	3½″
⅝″ wallboard	3¾″

HIGHLY EFFICIENT SOUND CONTROL

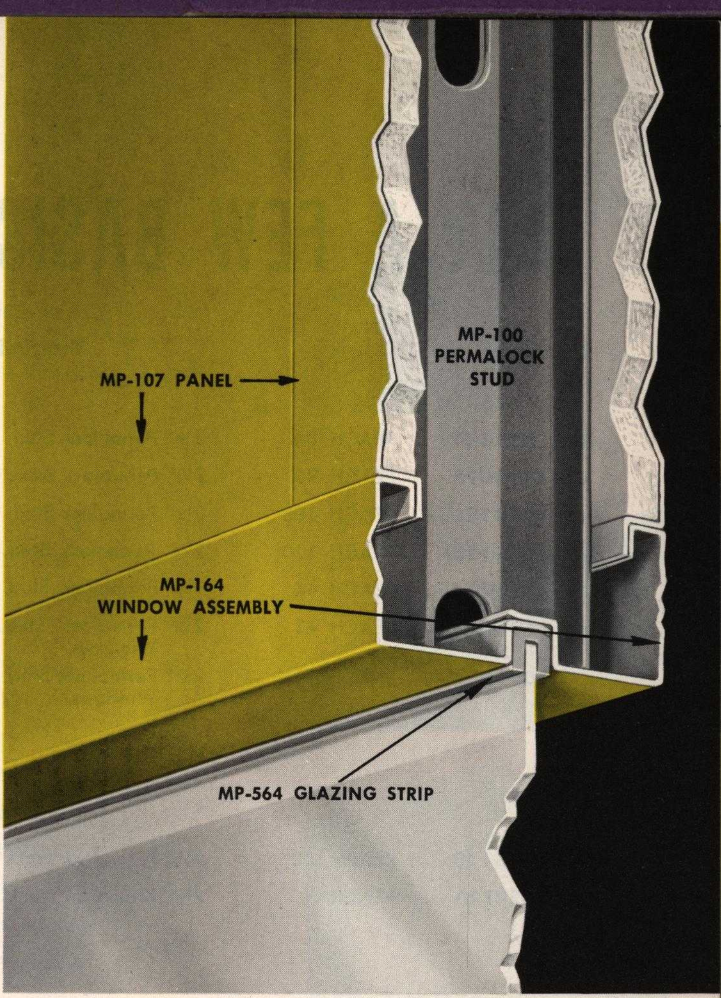
An important consideration in selecting movable partitions is their effectiveness as a barrier to the transmission of sound. Many people find difficulty in performing their best work when surrounded by distracting noises.

Penmetal movable interiors are designed to reduce to a minimum the transmission of sound from the area on one side of the partition to the area on the other side. How efficient they are has now been demonstrated in a test conducted by a recognized, independent testing laboratory.

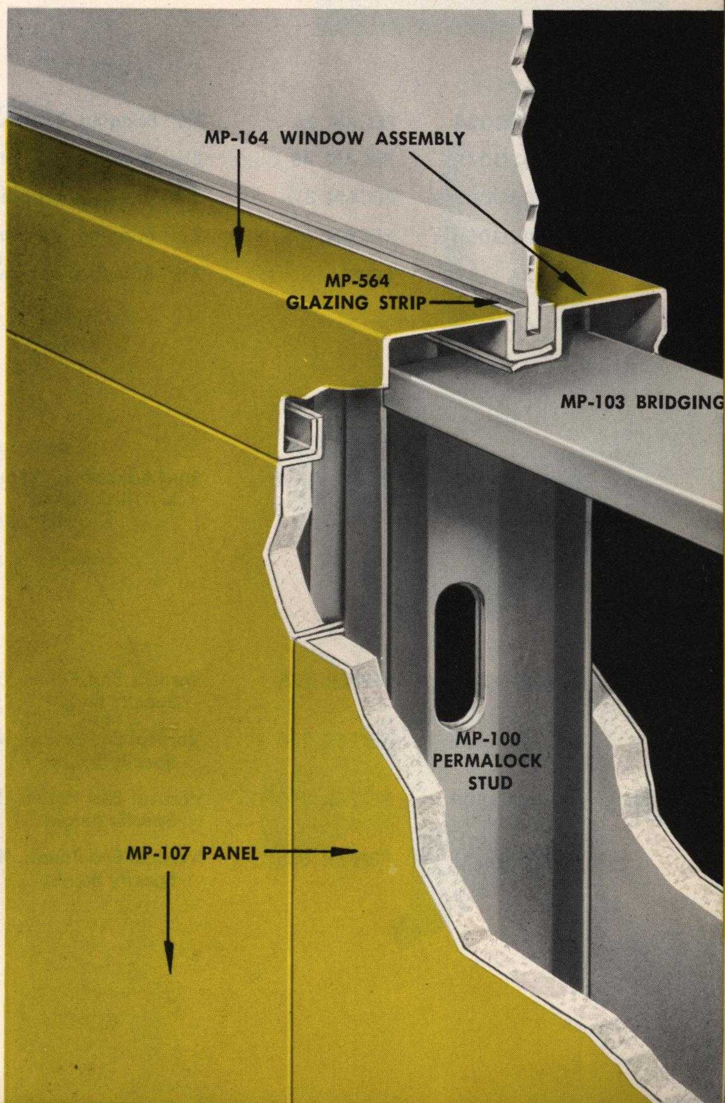
In this test, *an outstanding average sound-transmission-loss rating of 43 decibels was secured.* The results of the test also show exceptionally high decibel reductions at the critical sound-frequency ranges. The sound-transmission loss averaged 44.5 decibels at 350, 500, 700 and 1000 cycles per second.

A standard, 3″-thick, floor-to-ceiling Penmetal partition, without doors or windows, was tested. There was no packing between the studs; the only insulation was the standard panel backing.

In considering these ratings, it should be understood that the sound resistance of any partition may vary in adequacy with its location. What a person hears through a partition is affected by the general masking noise level, the amount of sound absorption in the rooms and, of course, openings for doors, windows, ductwork, etc. It should also be remembered that equally good ratings cannot be expected from glazed-railing and cornice-high partitions.



UPPER ILLUSTRATION: Cut-away view of top section of 8′ or 9′ steel-and-glass partition.



LOWER ILLUSTRATION: Cut-away view of bottom section of steel-and-glass partition.

RAPID ERECTION

Penmetal movable interior partitions are fast and easy to erect or dismantle. Work can be done without disturbing normal office routine in adjacent areas, and there is no mess to be cleaned up after the work is completed.

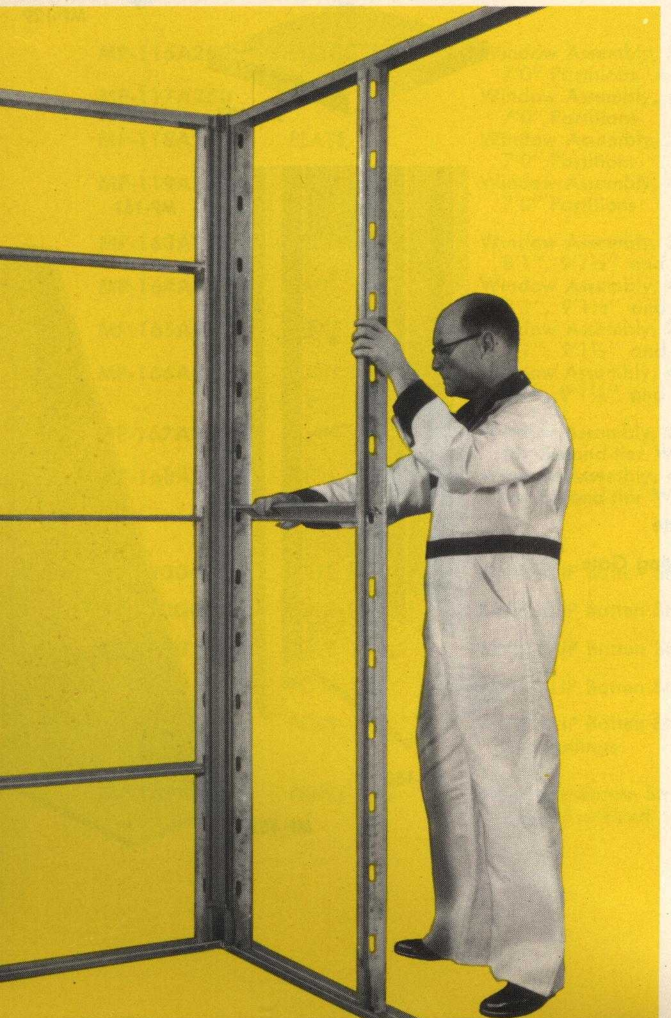
When a partition is taken down, all parts can be salvaged for re-use in another location. In short, there is no loss of materials when a partition is moved.

After a partition is erected, doors and windows can be interchanged or moved to new positions. Changes are easy to make, and new parts are not required.

The illustrations on this and the opposite page show how easy it is to install one of these handsome interiors. Note how few parts – all of which are standard—are required. The partition can be erected and demounted with ordinary tools.

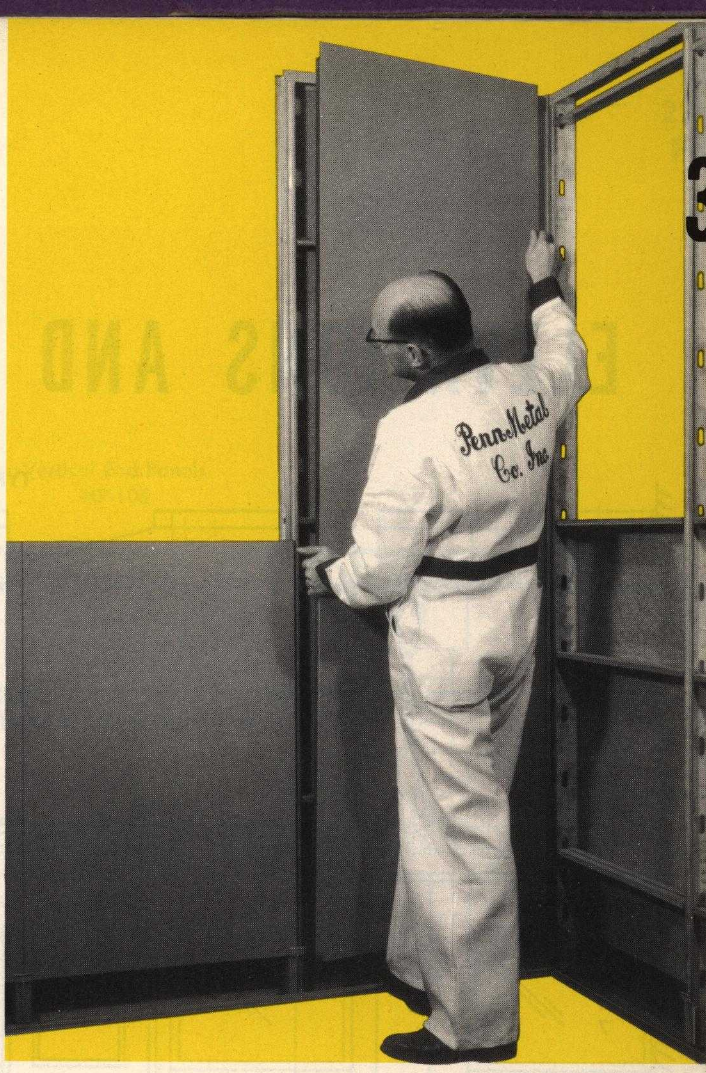
1

Here, a vertical end panel, set in floor and ceiling track, is attached to the existing wall. The vertical end panel will "finish off" the completed partition at the end. The floor and ceiling track are identical rolled channels. The Permalock studs are positioned 24" on centers.



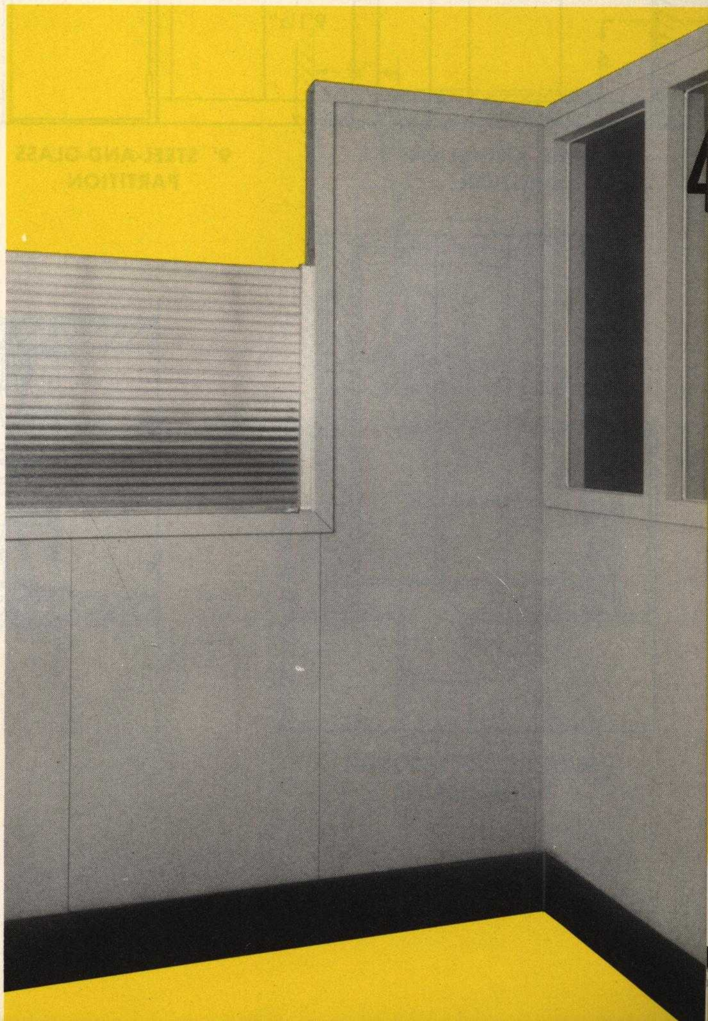
2

The next step is the installation of bridging. These members are installed by inserting their ends into the stud openings and then rotating so that their grooves engage the sides of the opening. Bridging is furnished in two lengths, for stud spacings of 24" and 48". (The longer length is used over doors and windows.) They provide the necessary stability for the partition, and they also assure accurate spacing for the studs, which is necessary for the application of the panels. The inside corner panel, which is shown in place, provides an unbroken interior corner.



3

In this photograph, an enameled-steel panel is about to be snapped into the groove in the Permalock stud. The bottom edge of the panel rests on the stud adjuster; the top panel edge will be covered later by the cornice. In addition to supporting the panel, the stud adjuster acts as a leveling bracket for the stud, to assure horizontal partition lines regardless of irregularities in the floor. The base is also attached to the stud adjusters.



4

The finished partition, with base, cornice, and window framing attached, gives an impression of permanence and, yet, it is as easy to take down as it was to put up. Note that the joints between panels are hardly noticeable. This simple partition points up the versatility of Penmetal interiors. The section at the right is a steel-and-glass, 7'0" cornice-high partition. At the left, is a standard glazed railing. All parts, excluding the glass, are furnished by Penn Metal Company, Inc. This assures uniform quality throughout, as well as certainty that all parts will fit together for rapid, trouble-free erection.

DOORS

Doors for Penmetal movable interiors are of high-quality design, primed to prevent corrosion, and finished in baked-enamel colors to match or contrast with the steel paneling of the partition. They are of hollow, flush-panel construction, 1¾" thick.

Two steel sheets, forming the external surfaces, are spot-welded to internal reinforcing channels, spaced not more than 8" on centers. The channels extend vertically through the full door height. Filler materials are placed between the steel sheets to prevent metallic ring and to act as an insulator.

Standard equipment includes one pair of hinges, which are installed 7" from the floor and the top of the door. A choice of lock sets and other hardware, as described on pages 20 and 21, is available from stock.

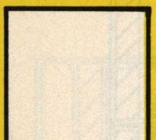
Three types of doors are furnished as standard: 1. flush paneled, 2. flush glazed, 3. flush louvered. All are of equally fine construction, built to last a lifetime.

Flush-paneled doors present a smooth, unbroken surface on both sides. There are no joints, projections or indentations of any kind.

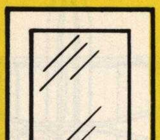
Flush-glazed doors are available, less glass. Sill height is 44⅞" from the floor.

Flush-louvered doors are similar to the flush-paneled doors, except for a stationary louver which is placed near the floor. The louver permits free circulation of air. It is sight proof from any angle.

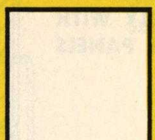
In addition to the three standard designs illustrated, special doors can be supplied to meet individual requirements.



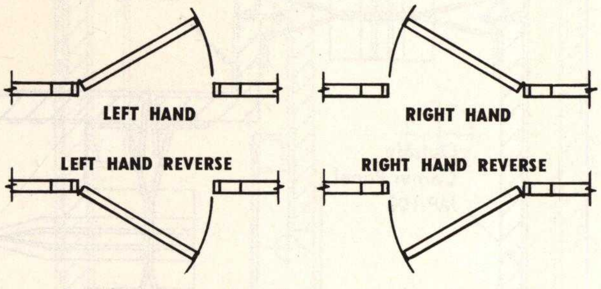
Flush paneled



Flush glazed



Flush louvered



Standard door swings (facing door from key side).

GLASS*

Penmetal movable partitions can be glazed from a wide selection of clear or obscure glass. Your Penmetal distributor will assist you in the selection of the type best suited to your requirements.

Clear glass is available in 3/16" crystal sheet, ⅛" D.S.A., or ¼" polished plate. Strongest of the three is ¼" polished plate, which is also distortion free. However, the other two types are widely used in movable partitions, and are satisfactory for many installations.

Obscure glass can be supplied in a wide variety of interesting patterns. Selection depends upon the artistic effect required and the degree of light transmission needed. The three patterns illustrated are only a few of the many types available.

For glazed railings, ¼" thick glass, either clear or obscure, is recommended. Single strength and D.S.B. glass are not suitable for use in glazed-rail partitions.

The glass is set in a special Penmetal vinyl glazing strip. These strips simplify installation and removal of the glass. Putty is not required and is not used.

Because the glazing strip is resilient and nonmetallic, it eliminates rattling of the glass and greatly reduces the possibility of breakage due to excessive jarring. The glazing strip is held securely in position by the window assembly.

LIGHT TRANSMISSION TABLE
(Clean Glass)

Type	Thickness	Approximate Transmission Value
Polished plate	¼"	88%
39 oz. crystal	3/16"	89%
D.S.A.	⅛"	90%
Obscure—usual patterns	7/32"	74% to 86%

To be secured from local sources; not supplied by Penn Metal Company, Inc.

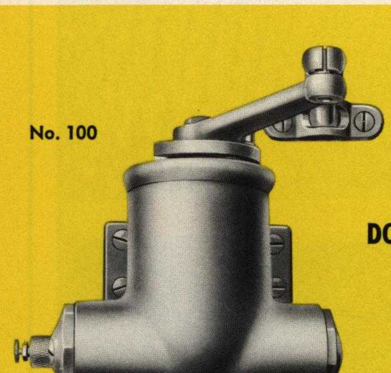
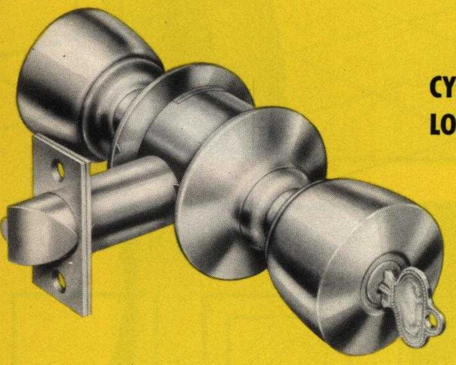
DOOR PUSH AND PULL PLATES

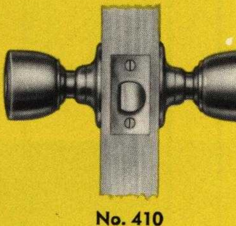
No. 100



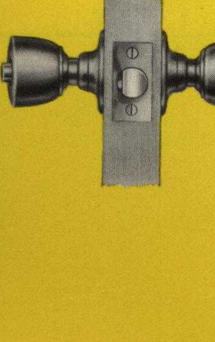
DOOR CLOSERS



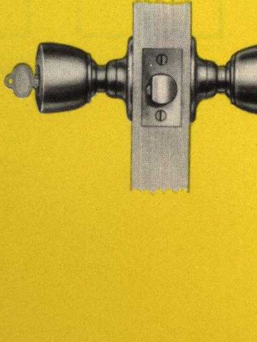
CYLINDRICAL LOCK SETS



No. 410



No. 422



No. 446½

HARDWARE

Standard hardware, furnished with Penmetal movable partitions, is the heavy-duty type, designed for lasting service. With the exception of the door hinges, all items are either wrought or extruded bronze with a lustrous, satin finish. Hinges are polished and plated steel.

All items listed on this and the opposite page are carried in stock for immediate delivery. Nonstocked, special-order hardware can be supplied, but will cause a delay in delivery. When required, such items should be ordered well in advance.

DOOR PUSH AND PULL PLATES

These plates are furnished for installation on swinging doors to assure easy traffic flow. Both plates are 14" x 3½" in size. The grip on No. 626 measures 5¼" from center to center, and projects 2⅜".

DOOR CLOSERS

The No. 100 door closer is a rugged, dependable device designed to close doors surely and quietly. Opens to 100 degrees. It is reversible for right- or left-hand doors, without any rearrangement of parts.

CYLINDRICAL LOCK SETS

Three standard styles of cylindrical lock sets are available for corridor, closet, communicating and inner-office doors. These lock sets are interchangeable; all meet U.S. Government Specifications Type 161.

No. 410, *for passage and closet doors.* Latch bolt by knob either side. Each knob always free.

No. 422, *for communicating or inner offices.* Latch bolt by knob either side. Push button locks outside knob; inside knob always free. Turning inside knob or closing door releases push button.

No. 446½, *for corridor doors.* Latch bolt by knob either side. Inside knob always free; outside knob locked by key in inside knob. Key in outside knob retracts latch bolt when outside knob is locked.

MORTISE LOCK SETS

These lock sets are supplied in three different styles, with either plain or antifriction latch bolts. (The letter "A" before the number designates antifriction type.) They are available with an adjustable bevel from flat to standard ⅛″.

No. 2038 and A2038, *for inner office doors.* Latch bolt by knob either side except when outside knob is locked by stop in front; by key outside at all times.

No. 2056 and A2056, *for corridor offices.* Latch bolt by knob either side except when outside knob is locked by stop in front; by key outside at all times. Auxiliary latch deadlocks latch bolt and stop, preventing manipulation when door is closed.

No. 2059 and A2059, *for corridor closet doors.* Latch bolt knob inside and by key outside. Outside knob rigid at all times. Auxiliary latch deadlocks latch bolt, preventing manipulation when door is closed.

KICK PLATES

Stocked for doors that are subject to heavy traffic, these plates may be attached to one or both sides. They are available in 16-gage brushed aluminum or brushed brass or in Formica in various colors, for 2′6″ or 3′0″ doors. Height is 6″.

BALL-BEARING HINGES

Hinges have button tip and plug. They are furnished with two ball bearings for noiseless, antifriction operation. Available in size 4½″ x 4½″.

AUTOMATIC DOOR HOLDERS

No. 220 door holders are for application to either wall or base. Spring tension is adjustable to suit different widths and weights of doors so that proper holding tension can be obtained without placing undue strain on the door.

DOOR STOPS

Two styles of door stops are available. No. 165 has a base 2¼″ in diameter, and projects 3⅝″. The diameter of the No. 209 is 1⅞″, and it projects 1⅜″.

SPECIFICATIONS

Penmetal Movable Interiors with Steel Panels

I CEILING-HIGH AND/OR CORNICE-HIGH PARTITIONS

A. General — Furnish and erect complete, Penmetal movable steel interiors, flush type, full 3" thick, ceiling high and/or cornice high, as manufactured by Penn Metal Company, with doors, glass, and approved standard hardware.

B. Shop drawings, if requested, shall show plan layout and details of construction.

C. Materials

1. Concealed structural and framing members shall consist of Penmetal Permalock studs in 2½" widths, with 1-3/16" minimum facing, set in standard-length Permalock channels at floor and ceiling or cornice rail (if cornice-high installation), and braced with Penmetal bridging members. Studs shall be designed to receive attaching units of the panels. They shall also be punched for the passage of concealed wiring, so that electrical outlets can be placed at random on the surface of the partition.
2. Steel-panel units shall consist of 20-gage finished-leveled sheet steel with ¼" sound-deadening insulation board bonded to the panel sheet.

D. Construction

1. Partitions shall be so designed and constructed as to be readily erected and quickly demounted, wholly or partially, and relocated without damage to partition or adjacent walls. Parts shall be arranged so that 2-, 3-, or 4-way extensions may be joined thereto, and panels may be removed without disturbing the rest of the partition.
2. Floor and ceiling channels shall be anchored in place. Studs shall be set 24" on centers in floor and ceiling channels or cornice rail, and Penmetal steel bridging shall be inserted between the studs at the following heights:

Height of Partition	Number and Spacing of Bridging Members
7 ft. or 8 ft.	3 (at third points)
9 ft. or 10 ft.	4 (at quarter points)

Note: 2 pieces of bridging are recommended behind short panels under windows and railings.

Steel panels shall then be snapped into the studs, and trim shall be applied in accordance with standard methods of erection. All connections to floors, walls and ceilings, and between structural units, shall be concealed. Steel base shall be applied by Penmetal's attachment system.

II STANDARD RAILING-HIGH PARTITIONS

Standard railings, where shown on the drawings, shall be movable, full-flush, 44⅞" high, with neat flush-cap molding. They shall be securely anchored to the floor, and shall be constructed of the same high-quality materials, and to the same standards of workmanship, as the partition. Where specified, they shall match partitions in color or finish.

III GLAZED-RAIL PARTITIONS

Where shown on the drawings, glazed-rail partitions shall be movable, full flush; securely anchored to the floor; and constructed of the same high-quality materials, and to the same standards of workmanship, as the partition. Steel panels shall be 44⅞" high, with 24"-high aluminum clear anodized glazing posts above to receive ¼" glass, as specified.

IV GATES

Gates, where called for on the drawings, shall be double acting, equipped with all necessary hardware.

V TREATMENT OF MATERIALS (RUST RESISTANCE)

All members shall be protected against rust by the Parkerizing method, or shall be galvanized. Structural-steel members, when required for reinforcement, shall be 40,000-psi, Penmetal structural-grade steel (ASTM Specification — Designation A-245), painted with an oven-dried coat of rust-resisting, red-oxide. Exposed surface panels and accessory units shall be finished in prescribed colors of baked enamel over a Parkerized surface, as required.

VI FINISHED SURFACES OTHER THAN STEEL PANELS

General specifications, as heretofore stated, also apply to framing and erection of finished surfaces other than steel panels, where applicable.

A. Unfinished wallboards shall be applied vertically in 24"-width increments, and shall be held in place by Kwik-Klip batten strip No. MP-120G. Where wallboard in standard 4' widths is used, application and finish, including tape and cement, shall be in accordance with the wallboard manufacturer's standard specifications. In lieu of regular nails, the nails and/or screws used shall be in accordance with the table in section I, paragraph D-2, on page 23.

B. Wood-grained wallboards and veneered plywoods shall be applied vertically in 24"-width increments, and shall be attached to the studs by Penmetal aluminum batten strip No. MP-145 or Penmetal angle backing attachment No. MP-144G.

VII WORKMANSHIP

The finished partition shall be plumb, neat in appearance, free from defects, and with horizontal lines leveled. Hardware shall be adjusted and left in proper working condition.

SPECIFICATIONS Penmetal Demountable Wallboard or Wood-panel Partitions

I CEILING-HIGH AND/OR CORNICE-HIGH PARTITIONS

A. **General** — Furnish and erect complete, Penmetal wallboard or wood-panel interior system with doors, glass, and approved standard hardware.

B. **Shop drawings,** if requested, shall show plan layout and details of construction.

C. **Materials**

1. Concealed structural and framing members shall consist of Penmetal Permalock studs in 2½" or 3⅝" widths as specified with 1-3/16" minimum facing, set in standard-length Permalock channels at floor and ceiling or cornice rail (if cornice-high installation), and braced with Penmetal bridging members. Studs shall be designed to receive attaching units for wallboard or wood panels, as required by the type of collateral material. They shall also be punched for the passage of concealed wiring, so that electrical outlets can be placed at random on the surface of the partition.

D. **Construction**

1. Partitions shall be so designed as to be readily erected and quickly demounted, wholly or partially, and relocated without damage to partition or adjacent walls.

2. Floor and ceiling channels shall be anchored in place. Studs shall be set 24" on centers in floor and ceiling channels or cornice rail, and Penmetal steel bridging shall be inserted between the studs as follows, for either 2½" or 3⅝" studs:

Height of Partition	Bridging
8 ft. to 10 ft.	1 row at center
10 ft. to 16 ft.	2 rows

Wallboard or wood panels shall be applied vertically in 24"-width increments, and shall be held in place by Penmetal batten strip No. MP-120G or MP-145, or by Penmetal angle panel attachment No. MP-144G, in accordance with Penmetal standard methods of erection. Where wallboard in standard 4' widths is used, application and finish, including tape and cement, shall be in accordance with the wallboard manufacturer's standard specifications. In lieu of regular nails, the nails and/or screws used shall be as specified below.

All connections to floors, walls and ceilings, and between structural units, shall be concealed. Steel base shall be applied by Penmetal's attachment system. Where rubber or plastic base is to be used, application shall be in accordance with the manufacturer's recommendations.

	Screws*		Nails‡	
Panel Thickness	Length	Type of Washer†	Length	Type of Washer†
⅛"	⅞"	No. 2	—	—
⅜"	1"	No. 2	1"	No. 1
½"	1⅛"	No. 2	1⅛"	No. 1
⅝"	1¼"	No. 2	1¼"	No. 1

* Screws shall be flat-head, galvanized, S/M screws.
‡ Nails shall be Stronghold, 11-gage, flat-head, ratchet-type, coated.
† Washers shall be galvanized (for use with wallboard) and supplied through Penn Metal Company.

II STANDARD RAILING-HIGH PARTITIONS

Standard railings, where shown on the drawings, shall be movable, 44⅞" high, with neat flush-cap molding. They shall be securely anchored to the floor, and shall be constructed of the same high-quality materials, and to the same standards of workmanship, as the partition.

III GLAZED-RAIL PARTITIONS

Where shown on the drawings, glazed-rail partitions shall be movable; securely anchored to the floor; and constructed of the same high-quality materials, and to the same standards of workmanship, as the partition. Panels shall be 44⅞" high, with 24"-high glazing posts above to receive ¼" glass, as specified.

IV GATES

Gates, where called for on the drawings, shall be double acting, equipped with all necessary hardware.

V TREATMENT OF MATERIALS (RUST RESISTANCE)

All members shall be protected against rust by the Parkerizing method, or shall be galvanized or painted. Structural-steel members, when required for reinforcement, shall be 40,000-psi, Penmetal structural-grade steel (ASTM Specification — Designation A-245), painted with an oven-dried coat of rust-resisting, red-oxide.

VI WORKMANSHIP

The finished partition shall be plumb, neat in appearance, free from defects, and with horizontal lines leveled. Hardware shall be adjusted and left in proper working condition.

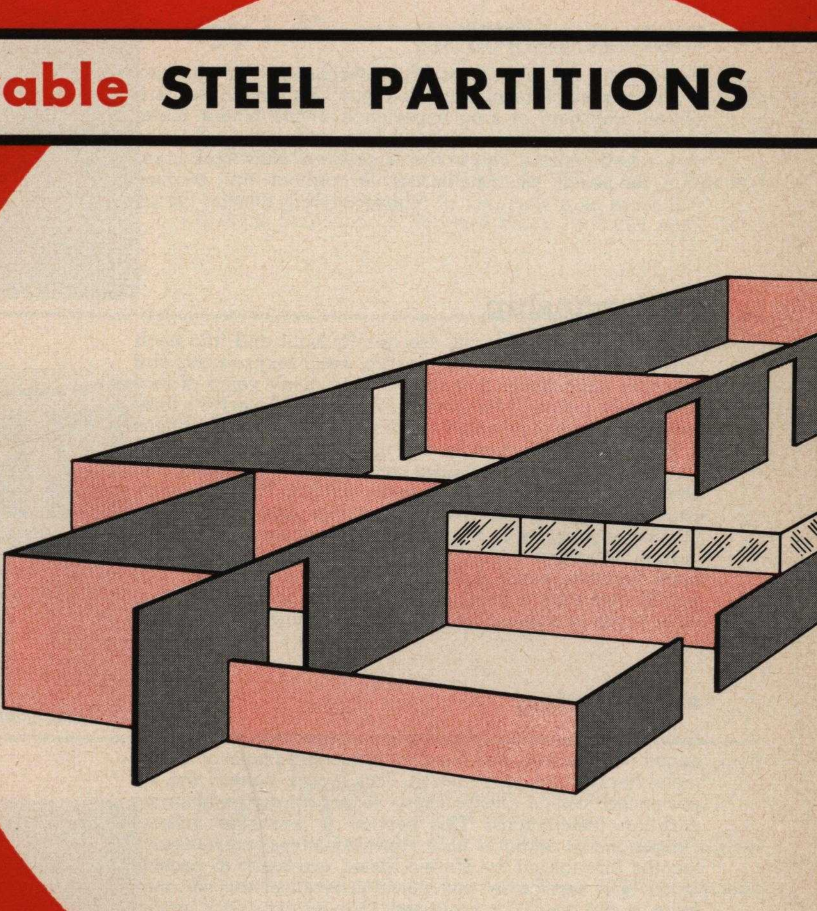
movable STEEL PARTITIONS



CATALOG No. 60

modern movable Steel partitions for all purposes

service

Steel Partitions' long experience in fabricating and installing movable steel partitions has developed an organization of sales and field representatives, engineers, production men, erectors and management personnel well grounded in the basic requirements and fundamentals essential to handle any metal partition installation whether it be large or small.

responsibility

Steel Partitions welcomes the responsibility of handling the complete job—from the initial planning layouts, complete fabrication through final installation, ready for occupancy. Our specially trained erection crews travel the entire country installing original work as well as rearranging old layouts and can always be relied upon to give 100% cooperation to other related trades and sub-contractors.

highest quality

Nothing but the highest quality materials are incorporated in the manufacture of our products. Our employees are skilled craftsmen of long experience in the hollow metal industry. The hollow metal industry came into existence over a half century ago in the Jamestown, New York area. Our thousands of installations throughout the country will serve as a warranty of highest quality (Partial list on Page 19.)

workmanship

Steel Partition panel units are quality built and into each unit goes the skilled craftsmanship, keen engineering and practical experience that results from many years of sectional steel partition fabrication. As one of America's foremost producers of movable metal partitions, Steel Partitions is well qualified to handle any movable steel partition installation you may have under consideration. Highly skilled and experienced metal craftsmen, working in a modernly equipped plant, with quality materials and under rigid controls is your assurance of advanced construction details, lasting structural stamina, rigidity and enduring finish. Steel Partition panel units have that built-in custom like quality that only a product made by an organization that takes pride in doing a good job can produce.

engineering

Steel Partitions, Inc., maintains a competent and experienced engineering staff familiar with every phase of hollow metal design and construction. This highly trained and experienced staff is always ready to assist you in planning partition installations. This service is available without obligation. In addition field representatives, conveniently located throughout the United States, are ready to provide on-the-spot service for any partition requirement you may have on the boards or projected. Our service is not limited to standard items. We welcome your special requirements that may be incorporated in a typical installation.

3. The ultimate in simplicity—only four basic parts required.
4. Special height partition at standard partition prices. Eliminates costly top fillers.
5. All steel partition easily converted to glass and steel. Fully flexible to changes in the field.
6. Easily and quickly installed by untrained workers.
7. Mass produced on modern equipment results in fast deliveries.
8. Readily accessible lay-in wiring in base and cornice —space also available vertically between panels.
9. Easily stored or warehoused.

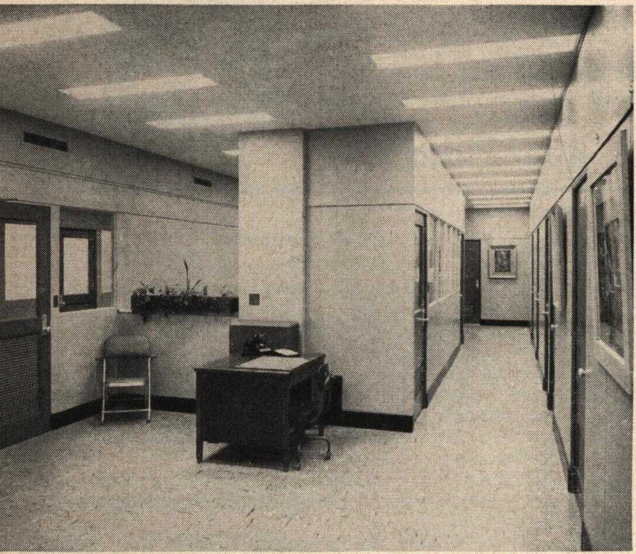
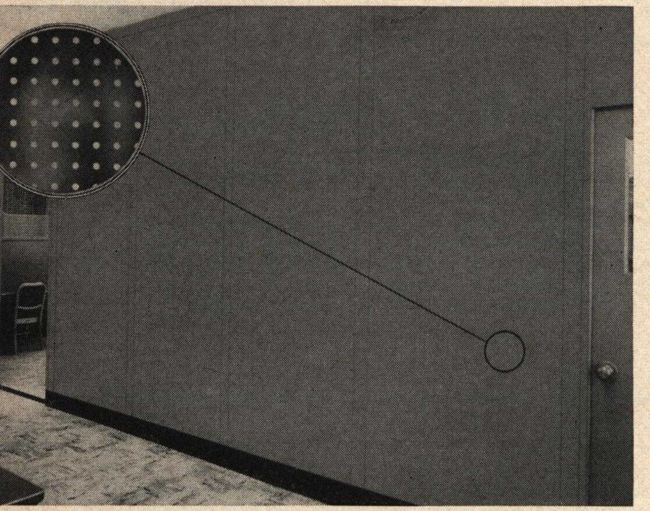
fire rated movable metal partitions

1. Meets ASTM ONE-HOUR Fire Test Specifications E 119-55.
2. Can Be Used in Adjoining with Type "JFN"—Matching Exterior Appearance.
3. Added Protection for Personnel and Valuable Equipment.
4. Provides Flexibility for Future Needs and Without Dust and Debris.
5. Saves Space.
6. Answers Need For One-Hour Fire Partition in Corridors, Public Buildings, Equipment Rooms and Laboratories.

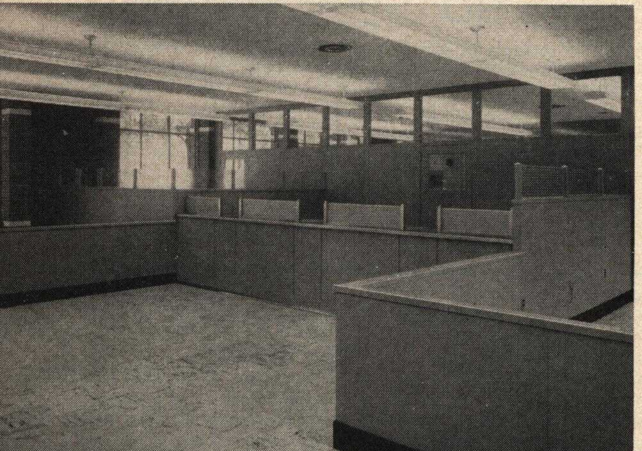
type JFN—a modern flush partition



Onodoga County Office Building, Syracuse, New York. Flush 7′-2¾″ all steel and glass and steel partition 42½″ chair rail with double mineral board top filler. Low rail 42½″ high.



Flush all steel to 9′-0″ ceiling perforated acoustic wall.



Flush low railing 42½″ high and bank railing 54″ plus 12″ glass. Flush glass and steel partitions. Pennsylvania Gas Co., Jamestown, N. Y.

Type "JFN" full flush panel units introduce an advanced conception of movable steel partition and wainscot especially adapted for executive offices. It is definitely functional in design, presenting, when assembled, a modern, flush wall, unbroken by unnecessary lines and free from deep ridges or grooves to collect dust. TYPE "JFN" partition is pleasing to the eye, reflecting the quiet, restful efficiency so desirable in modern office interiors. The standard types and sizes of "JFN" panels are shown on Page 6. (Partitions are regularly designated as all-steel, steel-glass, steel-glass-glass, and steel-glass-steel, depending on the combination of units).

TYPE "JFN" matching wainscot for inside exterior and masonry walls harmonize with the movable steel partition to give a pleasing, modern complete interior. (See Page 7 for typical details).

TYPE "JFN" partition is modern in construction, offering many advanced and exclusive structural features that enhance its practical usefulness, enduring rigidity, flexibility and ease of erection and rearrangement. Some of these advantages are listed below and additional construction details will be found on Pages 6 through 8.

1 **EFFECTIVE SOUND INSULATED**
An exclusive "JFN" innovation provides a sound retarding factor in a standard 3-inch panel, greater than that accomplished by a 5½-inch commercial tile and plaster wall.

2 **EXCLUSIVE STRETCHER CHANNEL CONSTRUCTION**
A patented horizontal Stretcher Channel reinforcement member assures rigid, taut and ripple-free exterior surfaces regardless of how many times the partition is moved or re-arranged.

3 **COMPLETELY RUSTPROOFED**
"JFN" panels, cornices, bases, posts and reinforcement members are completely rustproofed inside and out by painting or plating.

4 **FULL FLOATING BASE**
Floating base construction assures flush floor contact where uneven floor conditions exist.

5 **CONTINUOUS WIRE RACEWAY**
A continuous divided wire raceway in cornice and base provide easy accessibility for both low and high voltage wires. Post construction allows for lay-in wiring in base.

6 **FLEXIBILITY**
2, 3 or 4-way post conditions can easily be formed from the basic one-way post assembly. Angular posts are adapted to meet installation conditions.

7 **SIMPLICITY**
"JFN" Partition is easily installed or relocated. There are few small parts to become lost or misplaced.

8 All doors are reinforced and mortised for both surface applied and concealed closers. Door Frame is adjustable type to allow for various clearances between bottom of door and floor.

perforated acoustic walls

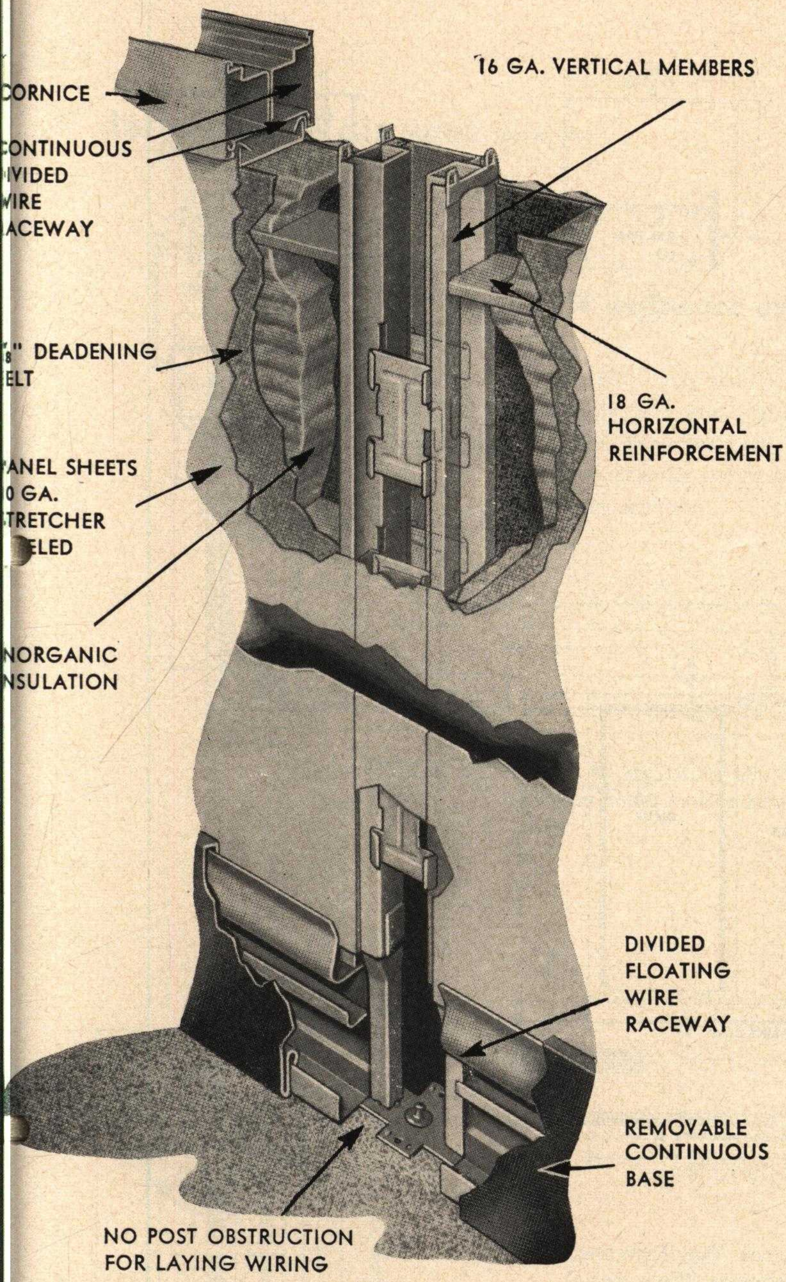
"JFN" Partitions are also available in acoustic units for all standard heights. The internal core is specially constructed to retard transmission of sound. Either or both sides of the panels may be perforated.

low railings and bank partitions

"JFN" units form attractive low railings and bank partitions.

Standard "JFN" units, selected from stock can be used effectively to control public and personal traffic in banks, finance offices, interview offices, public buildings and general offices. Their modern, full flush panel design harmonizes with any architectural style. TYPE "JFN" low railings (without glass) and bank partition (with glass) are 3 inches thick and have no protruding feet to mar the floor line, except where long runs occur and at gates. Stock units include gates, wickets and glass panels to meet all but the most unusual conditions. The fittings, trim and glass, are furnished to specifications. The same high quality workmanship and general structural features, that distinguish the full height "JFN" units are incorporated in their construction. Construction details will be found on Page 8.

features



single glazing

Exclusive "JFN" construction provides for easy removal of glass for replacement—No screws involved.

double glazing

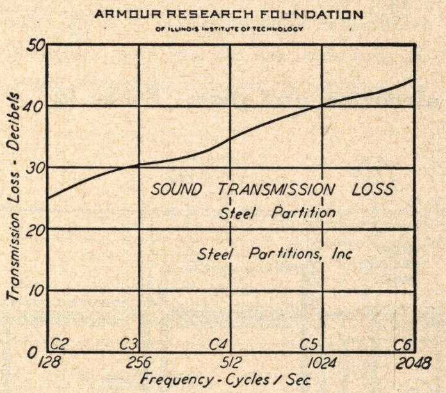
When soundproofness is desired for glazed panels a maximum co-efficient can be obtained by double glazing. "JFN" partition is also adapted to receive hermetically sealed double pane glass.

glass and mesh

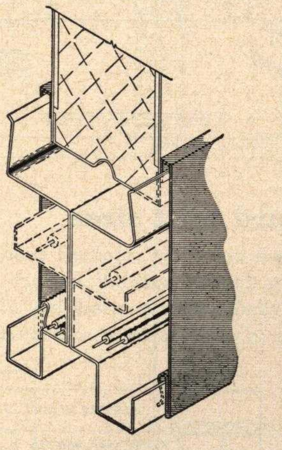
Syenite (obscure) glass 1/8" thick and DSA (clear) glass are standard for full height metal partition. 39 ounce crystal sheet or 7/32" syenite glass is standard for bank type partitions. Other standard glass types are available when specified. Metal partition putty is tinted to match finish. Vinyl plastic glazing mould (neutral color) also available when specified. In lieu of glass, common types of wire mesh and expanded metal may be substituted to meet special requirements.

soundproofing and dustproofing

Type "JFN" panels incorporate an exclusive sound insulating construction feature. In addition to the inorganic insulating material a 1/8" sheet of deadening felt is applied with mastic to the inner side of the metal skin. This sheet prevents practically all metal to metal contact between interior and exterior members. Tests by Armour Research Foundation on a standard "JFN" panel and wall filler section resulted in the sound insulating factor shown on the chart. Where more rigid conditions demand, the partition can be insulated as follows: Space within base, cornice, posts, wall filler, top filler (if any) shall be solidly packed with mineral wool during erection. Base shall be set in mastic seal making full contact at floor. Doors shall have threshold and wiper. Any glazed partition shall be double glazed or have hermetically sealed double panes thoroughly sealed on all sides.



DUST PROOFING can be accomplished by following the above steps plus caulking the wall filler and ceiling channels. LIGHT PROOFING as near as it can be attained follows the same procedure.



galvanized wire raceway

Floating **full length** galvanized raceway prevents corrosion from water seepage resulting from floor cleaning. Individual compartments, separate wiring for each room side of partition. Each side is also sub-divided to accommodate high and low tension circuits.

electrical service data

Provisions for electric services are normally made in the base and post assembly. Switches and duplex receptacles are located at convenient heights in the post. The latter also at desired intervals in the base. Switches, receptacles, and plastic or metal plates are available. Steel Partitions' standard cutout is 1 7/8" x 2 7/8".

specifications

I GENERAL

(1) Furnish and erect flush steel partitions as indicated on architect's plans and specifications. Partition to be, or equivalent to, Type "JFN" as manufactured by Steel Partitions, Inc., Jamestown, New York.

(2) Partitions shall be insulated, movable office partitions not less than 3" thick of hollow metal and interchangeable unit construction with adjustment at the base to take care of irregularities in the floor and with double steel insulated fillers at end conditions. Door units shall be interchangeable with panel units of the same size. Where indicated on drawings, the spaces between partition cornice and the ceiling shall have double sheet fillers of mineral board or cold rolled steel.

(3) Partition shall be erected on the finished floor.

II SHOP DRAWINGS

Drawings showing details of construction, gauges of metal, hardware and all special conditions, shall be submitted to the architect for approval before fabrication of material.

III MATERIALS

Concealed structural members shall be of steel. All exposed sheet metal shall be cold rolled, furniture stock steel that has been properly annealed, process leveled and has smooth, clean surfaces. Gauges specified are United States standard. All internal and structural members shall be either painted with a rust resistance primer or plated.

IV CONSTRUCTION

(A) **Panels:** The panel units shall be 3" thick and constructed of two 16 gauge roll formed vertical members, and 18 gauge rigid horizontal expansion members of galvanite coated steel. The horizontal members shall be spaced at approximately 12" centers the entire height of the panel. This structural assembly shall be covered on each face with 20 gauge, patent leveled, cold rolled steel sheets and stretch to a flat, smooth, wrinkle free surface. The inner surface of the panel sheets shall be covered with a continuous sheet of ⅛" deadening felt, securely cemented to the metal, to eliminate metallic sounds. The entire panel unit assembly shall be filled with an approved inorganic wool insulating material. For glass openings, provide the upper panels with mouldings for either single or double glazing. Mouldings shall be loose on one side, snapped in place without use of glazing screws.

(B) **Posts and Post Covers:** The post section shall be made up of the two 16 gauge galvanite coated steel panel side members and two 18 gauge post covers. The assembly completed by the use of 12 gauge clips galvanite coated steel, spaced at approximately 18" intervals. A shim and guide leveling device shall be provided at each post to compensate for irregularity in the floor.

(C) **Cornice:** The inner cornice shall be roll formed from 16 gauge cold rolled galvanite coated steel and so shaped as to form a rigid, horizontal, continuous, structural member along the top of the panel units. The shape of the cornice member shall be such as to provide two independent raceways accessible the entire length for installation of electric wiring from either side of partition. The inner cornice shall be punched at 6" intervals to permit wiring or concealed reinforcing at any post. Cornice trim moulding shall be 18 gauge rolled steel shape 3" high with plain surface of standard lengths and attached to inner cornice.

(D) **Base:** The base shall be 18 gauge, cold rolled steel of a removable type 6" high with 5/16" projection furnished in standard 10 foot lengths. The base shall be so constructed that when removed access will be provided the entire length of the double electric wiring raceway for high and low tension wire on both sides. Inner wiring raceway shall be galvanized steel full floating for adjustment to floor variations.

(E) **Doors and Frames:** Doors shall be 1¾" thick and of a size to provide 3/32" clearance at side and head jambs. Doors to be reinforced and welded in accordance with approved standard construction. Cutouts and reinforcements shall be provided for hinges and lock. All doors shall be reinforced for both concealed and surface applied closers for present or future use. Door frames shall be from 18 gauge cold rolled steel and shall be so shaped as to incorporate in its construction a rubber stop member at head and jambs for quieter operation. Frames shall be full floating type to compensate for floor variations. Doors shall be glazed when called for in a manner similar to the panel units.

(F) **Wall Filler Sections:** Wall filler sections shall be of sufficient width to meet normal building conditions and shall be an assembly of 20 gauge patent leveled sheets and channels. The assembly shall be so constructed to permit scribing and neat fitting to the wall conditions during erection. The completed assembly shall be insulated in the same manner as a panel unit.

(G) **Top Filler (when required):** Double mineral board filler ⅝" thick shall be applied to 1⅝" x 2¼" wood framing extending from cornice to ceiling neatly scribed to walls, beams, pipes, etc. Joints shall be reinforced, pointed, finish smooth and painted by Painting Contractor.
Double steel filler of 20 gauge shall be applied to steel studs and extended from cornice to ceiling. Single line joints shall be located to center at post conditions of lower panel units and shall be removable. Finish to be applied at factory to match partitions.
Top fillers may be packed with inorganic insulating wool if required and specified.

V HARDWARE

(A) **Provisions:** Suitable cutouts shall be provided in doors and frames for all mortice hardware. Steel reinforcements drilled and tapped and secured by spot welding shall be inserted for attaching all hardware and shall be of ample size to stiffen the sheet metal against the strain of the service required.

(B) **Hardware:** Hardware shall be manufacturer's standard of design and construction normally furnished with movable metal partitions. Doors shall have one pair 5" x 4" ball bearing button tip hinges. (Refer to catalog for additional hardware information.)

VI FINISH

(A) **Prime:** All parts shall be thoroughly degreased and free from dirt and rust and shall receive a primer-surfacer rust resisting coat of synthetic material formulated for high adhesion qualities. The partition shall be so constructed that all concealed parts in the panel, base, cornice and door can be primed as above prior to assembly.

(B) **Enamel:** Best quality (semi-gloss rubbed effect) enamel of color as selected shall be applied to all exposed surfaces, sanded smooth between coats and baked to a hard finish.

(C) **Grain:** Surface shall be prepared as indicated in paragraph (A) above. Ground color for graining shall be applied, baked and sanded after which the graining coat is applied and baked. At least two (2) coats of the highest quality pyroxylin lacquer shall be applied.

VII GLASS AND GLAZING

Glass shall be furnished by the partition manufacturer of design, quality and thickness as specified on drawings. Glass stops shall consist of cold rolled sections and shall have no exposed fastening or glazing screws. Glass shall be bedded and back puttied in special steel sash putty colored to match the partition. Vinyl plastic glazing mould shall be used in lieu of putty when specified for partition. Metal glazing retainer shall be furnished for glazed railing.

VIII ELECTRICAL PROVISIONS

Provision shall be made for concealed electrical wiring through base, cornice, posts and fillers at wall and ceiling. Double lay-in raceways shall be provided in the cornice and the base for the separating of high and low tension wiring. Cutouts shall be made in pilaster covers or base for electrical outlets or switches when specified.

IX ERECTION

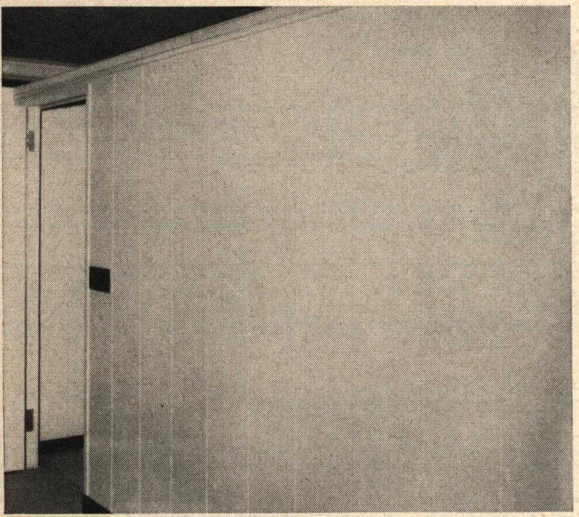
Partitions shall be erected straight and plumb in a rigid workmanshiplike manner. Hardware shall be adjusted and left in good working condition. Partitions shall be erected on finished floor with ceiling reinforcement at unsupported runs over 15-20 feet.

X CLEANING

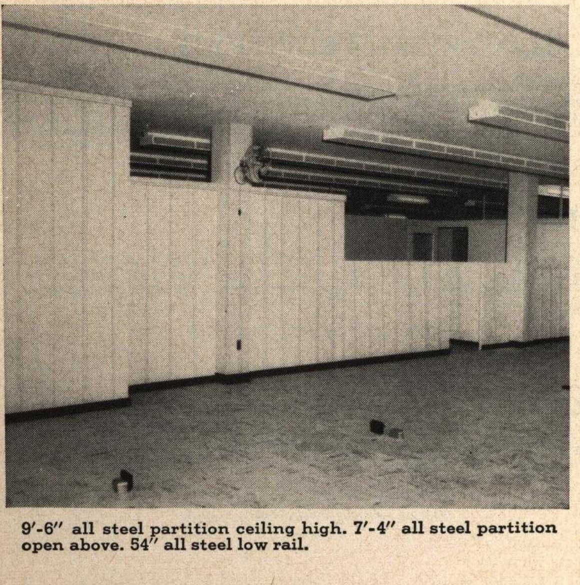
Remove all cartons, left over material, etc., and leave job broom clean. Touch up minor scratches and wipe down panels. Cleaning of glass and washing of partitions is to be performed by others.

type JL—new flush partition

New York Telephone Co., Utica, N. Y. Ceiling high all steel partition with glass sash.



New York Telephone Co., Utica, N. Y. 7'-4" all steel partition open above.



9'-6" all steel partition ceiling high. 7'-4" all steel partition open above. 54" all steel low rail.

A completely new and uniquely different 2" thick flush partition consisting of 12" wide panels custom fabricated to your particular ceiling height. Here is another new product from the engineering ingenuity of Steel Partitions, Inc. Simplicity of design plus new manufacturing techniques have been combined to produce this economically priced partition. Fabricated from quality materials in a workmanlike manner, this new, easy-to-erect type "JL" partition will enhance the appearance of any office area. It will also find wide acceptance in a multitude of industrial applications.

The efficient design of type "JL" has effectively eliminated many costly component parts usually associated with movable partitions without sacrificing the many advantages and desirable features expected from this type of building product. Single line flush joints add to the attractiveness of the partition and provide ideal surfaces for field application of various decorator materials.

outstanding features

1. Panels can be easily field cut horizontally or vertically.
2. Vertically adjustable door frame with vinyl cushioned stop on three sides.
3. Easily stored or warehoused—few component parts.
4. Triple wire raceways in base—double raceways in cornice and every 12" vertically between panels.
5. Full light glass panels as well as unobstructed horizontal glass sash. Can be field cut for alterations.
6. Cross runs (Tee Conditions) can be installed at any location. No restrictions that are common to post and panel construction.
7. Custom heights at standard prices—costly top fillers eliminated.
8. Fabricated from steel or aluminum with high quality baked enamel factory applied finish. Also available with various surface treatments such as vinyl plastic-coated material in a variety of colors and textures.
9. Quickly installed by Steel Partitions, Inc. erectors—or if preferred, local building maintenance personnel can install without difficulty.
10. All Steel Partition can be field cut and readily converted to Glass and Steel Partition by adding sash unit.
11. Completely re-usable.
12. Fast Delivery from stock.

low railing and bank partitions

In addition to being versatile in meeting typical floor to ceiling movable partition requirements, type "JL" is particularly suitable for semi-private enclosures.

All Steel Low Railing is available in all standard heights up to 68". "JL" Bank Partitions with glass (Please refer to Page 13 for chair rail and glass heights available) combine an appearance of simplicity with dignity.

All Low Railing and Bank Partition panels have the same single line joint flush surface that enhances the modern appearance of the full height partition. Flush 1¼" thick gates with or without glass may be added where desired. Gates are equipped with pivoted checking hinges to swing one or both directions. Also on glazed gates appropriate push or pull hardware of matching finish is included.

Due to the unique design of "JL" partitions and use of concealed vertical reinforcing members, amazing strength and stability is gained. They are easily dismantled and re-installed.

features

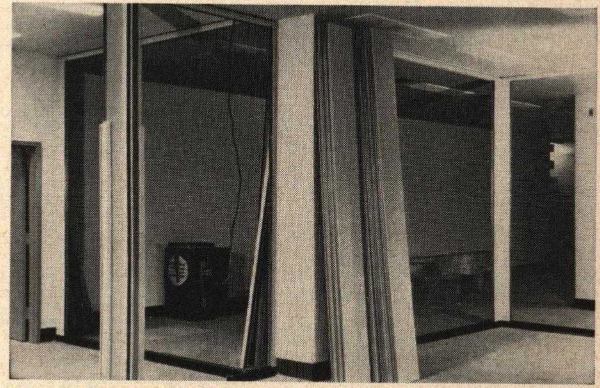
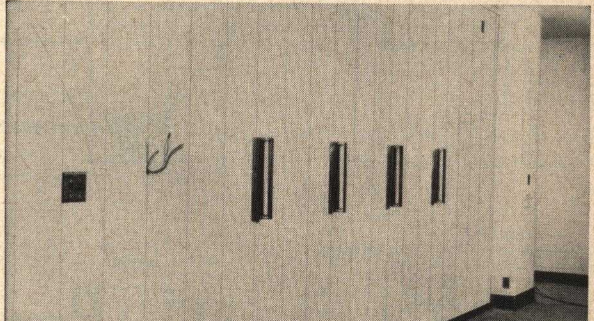
vertical wire raceway
extruded aluminum base
base snap cover
panel support plate
continuous horizontal wire raceways

Type "JL" 10 foot ceiling high panels being set in place.



Illustrates type "JL" ceiling high partition base, cornice, and wall channels ready for installation of panels and door units.



"JL" easily accessible for wiring—lay-in raceways both sides in cornice and base. Also vertical raceways ever 12 inches.

rigidity

"JL" panels incorporate built-in rigidity through use of modern design and fabricating techniques. Steel sheets are laminated to a honeycomb core impregnated against moisture, vermin and mildew. The honeycomb core is bonded to the steel sheets with a high strength adhesive.

The result is a panel embodying exceptionally high impact resistance and vertical stability. "JL" partitions effectively support standard steel pan type ceilings.

specifications

I GENERAL

(1) Furnish and erect flush metal partitions as indicated on architect's plans and specifications. Partition to be Type "JL" as manufactured by Steel Partitions, Inc., Jamestown, New York.

(2) Partitions shall be movable partitions 2″ thick Laminated Honeycomb construction in 12″ increments, so designed to received doors or sash units where shown on drawings.

II SHOP DRAWINGS

Drawings showing details of construction, gauges of metal hardware, and all special conditions shall be submitted to the architect for approval before fabrication of material.

III MATERIALS

Concealed structural members shall be of steel. All exposed sheet metal shall be cold rolled furniture steel that has been properly annealed, process leveled and has smooth, clean surfaces. Gauges specified are United States standard.

IV CONSTRUCTION

(A) **Panel units:** Shall be 2″ thick and constructed of two formed sheets of 22 gauge steel separated by impregnated honeycomb paper core, laminated with a high strength adhesive.

(B) **Base, Cornice, and Ceiling Channels:** Shall be 3″ high with a projection of ½″ from the face of the panels, and so designed as to permit the use of a single member for all three purposes. This member shall also be designed to incorporate a continuous wire raceway (Lay-in Type) on each side of the partition enclosed with a snap-on cover permitting easy access to the wiring at any time. This member shall be an Aluminum Extrusion.

(C) **Glass Openings:** Shall be constructed of a 16 gauge metal channel shape assembled in the partition in such a manner as to securely hold the panels below and above the glass opening in proper alignment. The glass sash shall be of knocked-down construction, assembled in the corner by means of a telescoping corner angle, so designed as to permit the sash units to be reduced in width in the field in case future rearrangement of partitions necessitate smaller openings.

(D) **Doors and Frames:** Shall be 1¾″ thick and of a size to provide 3/32″ clearance at side and head jambs. Cutouts and reinforcements shall be provided as required for hardware. Door frames shall be from 18 gauge steel constructed with ¼″ projection on each side of the panels and of knocked-down design for removing or installing in existing runs of partition. Door frame shall be so designed as to incorporate a cushion door stop of a Rubber or Vinyl extrusion. Standard jamb opening sizes to be normal 2′-10″ x 6′-11″ or 3′-10″ x 6′-11″.

(E) **Wall Filler Sections:** Shall consist of a wall channel, and a telescoping panel member creating sufficient adjustment to meet reasonable construction variations.

V HARDWARE

(A) **Provisions:** Suitable cutouts shall be provided in doors and frames for all mortice hardware. Metal reinforcements drilled and tapped and secured by spot welding shall be inserted for attaching all hardware and shall be of ample size to stiffen the sheet metal against the strain of the service required.

(B) **Hardware:** Hardware shall be manufacturer's standard; of design and construction normally furnished with movable metal partitions. Doors shall have one pair 5″ x 4″ ball-bearing button tip hinges. (Refer to catalog for additional hardware information.)

VI FINISH

(A) **Prime:** All parts shall be thoroughly degreased and free from dirt and rust. All exposed surfaces shall be coated with a synthetic rust resisting primer especially formulated for adhesive qualities.

(B) **Enamel:** Surface shall be prepared as indicated in paragraph (A) above after which best quality (semi-gloss rubbed effect) synthetic enamel of the standard color selected shall be applied.

(C) **Grain:** Surface shall be prepared as indicated in paragraph (A) above. Ground color for graining shall be applied, baked, and sanded smooth after which the graining coat is applied and baked. At least two (2) coats of highest quality clear pyroxylin lacquer shall then be applied.

VII GLASS AND GLAZING

Glass shall be furnished by the partition manufacturer of design, quality and thickness as specified on drawings. Glass stops shall consist of cold rolled sections and shall have no exposed fastening or glazing screws. Glass shall be set in Vinyl glazing channels of a color harmonizing with the partition color. Metal glazing retainers shall be furnished for glazed railing.

VIII ELECTRICAL PROVISIONS

(A) Provision shall be made in the base and cornice channels for wire raceways with removable snap-on covers.

(B) Provision shall be made between each panel for a vertical wire raceway and cutouts made in panels for switches or outlets when required by direction of the architect.

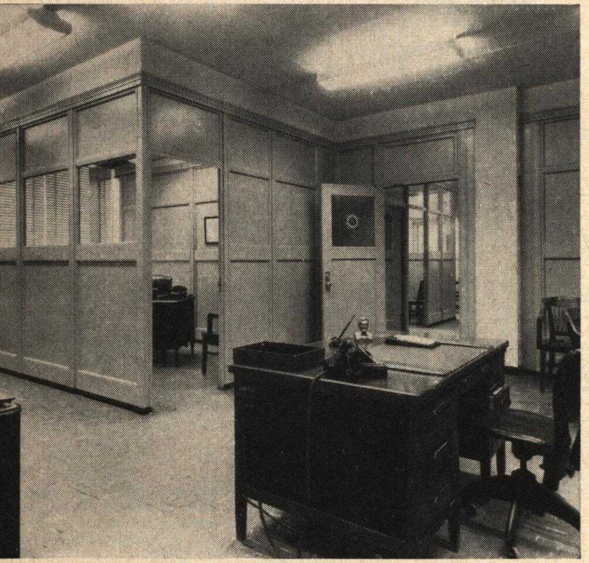
IX ERECTION

Partitions shall be erected straight and plumb in a rigid workmanshiplike manner. Hardware shall be adjusted and left in good working condition. Partitions shall be erected on finished floor with ceiling reinforcement at unsupported runs over 15-20 feet.

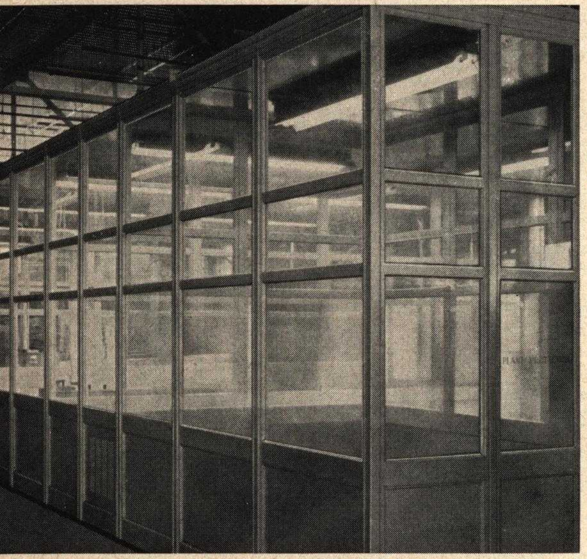
X CLEANING

Remove all cartons, left over material, etc., and leave job broom clean. Touch up minor scratches and wipe down panels. Cleaning of glass and washing of partitions is to be performed by others.

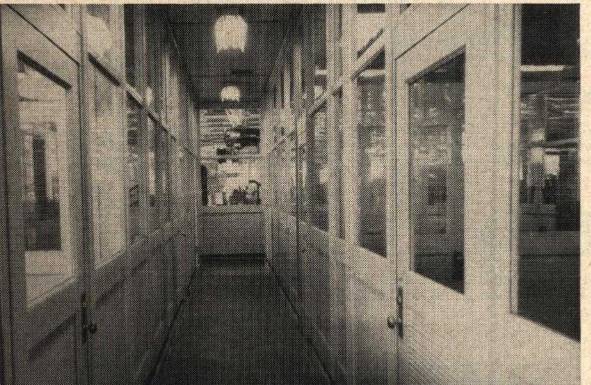
type E paneled wall



Lincoln National Bank and Trust Company, Syracuse, New York. Type E 9'-0" all steel and glass and steel partition, 54" chair rail, with double mineral board top filler.



Panel type factory installation. 12'-0¼" high glass and steel with single steel pan ceiling. Ford Motor Co., Parts Depot, Natick, Mass.



Type E 10'-4" glass and steel partition with steel pan ceiling.

- **100% interchangeable units**
- **100% reusable**
- **All welded construction**
- **quick, easy and economical to install**

TYPICAL ELEVATION OF PARTITION & RAILING

TYPE "E" is a basic paneled type sectional steel partition made up of Mono-Unit sections, each section a complete unit in itself. It has proved a most practical and economical method of partitioning offices, industrial and institutional building where maximum flexibility and complete interchangeability are desired. Since each panel is a complete integral unit, with its corresponding cornice and base units at the same width, TYPE "E" Mono-Unit partition can be quickly and easily assembled without cutting or fitting, and rearranged without waste. This assures 100% salvage. TYPE "E" panels and sash are available in a wide selection of standard stock sizes that facilitate a great variety of cornice heights. Door units are interchangeable with panel units of the same size. This provides maximum flexibility.

A neat cornice cap is furnished at each post connection. If the customer so desires, a continuous cornice is available in lieu of the unit cornice. Single or double steel top filler or double mineral board top filler can be added above the cornice to the suspended or slab ceiling to close off an area. TYPE "E" partition accommodates lay-in wiring in posts and cornice; at the base and chair rail fish-in wiring access is available.

TYPE "E" units are built to the highest metal fabricating standards, securely welded and reinforced to provide maximum structural stamina and enduring rigidity. Complete information on standard units available, construction details and specifications on Page 11. Type "E" Low and Bank Railing to match also available.

TYPE "E" partitions have enjoyed widespread popularity with leading architects, contractors and building owners as evidenced by the long list of installations, both large and small, throughout the country.

standard railing

Attractive, efficient railing, either low or bank type, are complementary to Type E partitions. See below for standard panel and gate units.

specifications

GENERAL—Furnish & install Type E, panel type partitions, as manufactured by **Steel Partitions, Inc.** Partitions shall be made up of units including the cornice, of standard width, so designed as to allow the utmost flexibility of arrangements and permit changes being made without disturbing units other than those to be rearranged.

Partitions must permit wiring through Base, Chair Rail, Cornice, Pilasters, and Wall Fillers.

MATERIALS—Shall be cold rolled, commercial quality steel. Panel plates shall be patent leveled. Mouldings shall be cold drawn for true sharp bends and profiles.

PANEL UNITS—Shall be of integral welded construction. The insulated panels shall be two 20 U. S. gauge plates separated by sound-retarding insulation.

FLUSH DOORS—Shall be 18 U. S. gauge steel 1¾″ thick of welded construction, properly reinforced for all hardware. Door units shall be interchangeable with panel units of the same size.

PILASTERS—Pilasters shall be cold drawn of 18 U. S. gauge steel, substantially reinforced and so constructed as to permit two, three, or four-way partition connections. Each pilaster shall be securely anchored to the floor.

CORNICE—Shall be of 18 U. S. gauge steel, cold drawn in unit lengths to conform with widths of panel units, and attached at each end to top of pilaster by split key anchoring wedge. A 14 U. S. gauge stiffener channel shall be the means of reinforcing the splice in the cornice over each pilaster. Pilaster caps shall be fitted to cover cornice joints. Install a dust cover of 16 U. S. gauge securely fastened to the cornice.

PARTITIONS TO CEILING—Ceiling high partitions shall be of the design described above, and accomplished by the addition of standard heighth sash added to the basic panel unit. Transoms shall be provided where shown on general drawings and shall be equipped with bottom counter balanced pivots.

MOP MOULDING—Adjustable steel mop moulding shall be attached to both sides of the bottom of all panels and pilasters with concealed fastening.

WALL FILLERS—Shall be of double thickness 20 U. S. gauge steel and of sufficient width to accommodate all conditions. The fit to the wall shall be snug and of neat appearance.

FINISH—The fabricated partitions shall be thoroughly degreased. All exposed surfaces shall be coated with a synthetic baking primer especially formulated for adhesive qualities. Final coat shall be high quality synthetic baking enamel. Sanded between coats and final coat, semi-gloss.

WORKMANSHIP—All materials shall be fabricated in the most approved manner, true to alignment and free from defects, neat in appearance and equal to the standard practice of the **Steel Partitions, Inc.**

GLASS AND GLAZING—All glass shall be embedded in special steel sash putty, colored to match the partition and to fit into rabbets of the partition sash, and shall be held in place by removable metal stops, securely fastened by oval head screws.

HARDWARE—Hardware shall be manufacturer's standard design (ours by Russel & Erwin). Locks shall be as specified for individual doors. All locks shall be interchangeable, one with the other; and master-keyed where required.

Door checks shall be of liquid type with regular or hold-open arms. All doors shall be equipped with one pair of 5″ x 4″ ball bearing steel butts.

ERECTION—All work shall be erected in a first class workmanlike manner under the supervision of a direct representative of **Steel Partitions, Inc.**

type SC smoke screens

corridor and stairwell

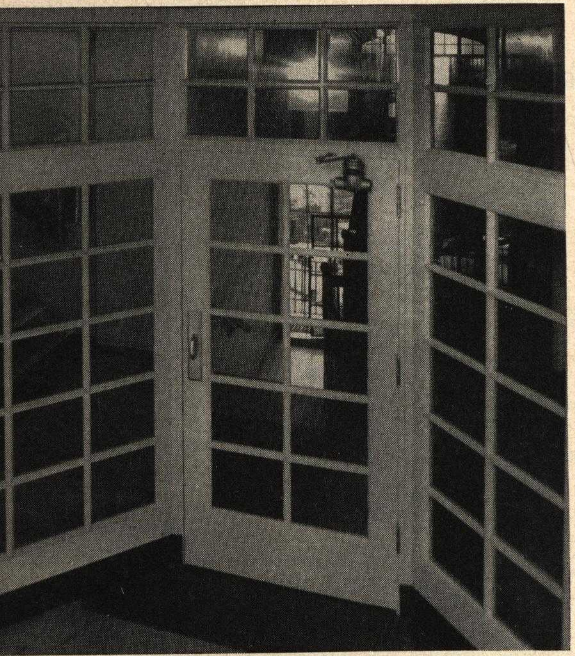
Localize smoke hazards and facilitate orderly evacuation in schools, hospitals, institutions, hotels, stores, public buildings

Smoke-filled corridors and stair wells can be as great a menace to the safety of the occupants of public and institutional buildings as fire itself. Steel Partitions, a pioneer in this vital safety field, makes available a practical and efficient Smoke Screen that is especially adapted by design and construction to guard against this hazard. These Smoke Screen units are designed both for use in new construction and for modernization programs as well.

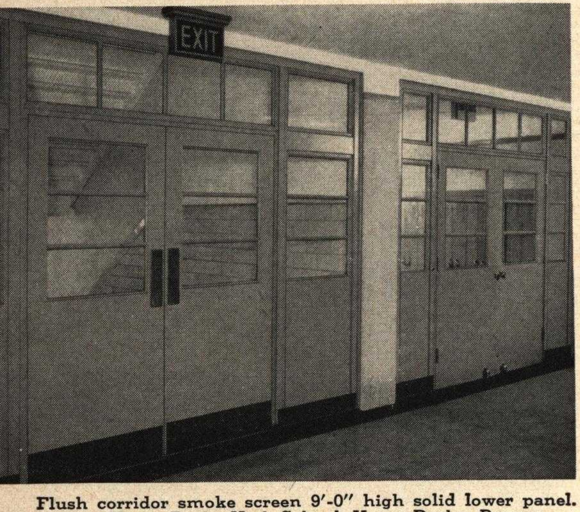
Smoke Screens are available in Type "JFN" full flush panel construction. Shown on this page are typical installations. Our competent and experienced engineering staff is always ready to work with architects, contractors and building owners to lay out an installation to meet their individual requirements.

No public or institutional building should be without the protection that these Smoke Screens afford. Industrial and commercial building owners are rapidly recognizing the importance of the added safety factor that they provide.

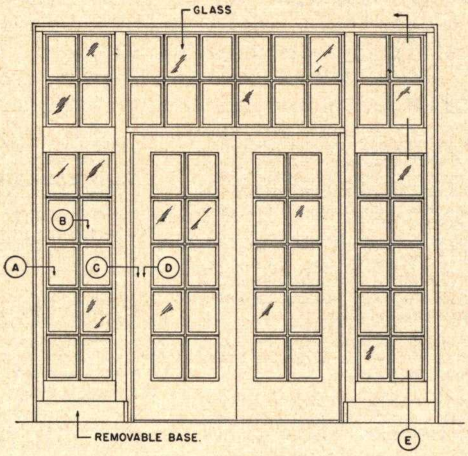
Smoke Screen construction details are shown below. Refer to Page 9 for General Specifications. Typical glass—¼" polished wire or MISCO. Typical hardware—push and pull plates, kick plates, standard butts with door closer or checking floor hinge.



Type "JFN" stairwell smoke screen 10'-0" high with fixed transom. Standard hardware and ¼ polished wire glass. St. John's Hospital, Cleveland, Ohio.



Flush corridor smoke screen 9'-0" high solid lower panel. Upper Darby High School, Upper Darby, Penna.



TYPICAL ELEVATION

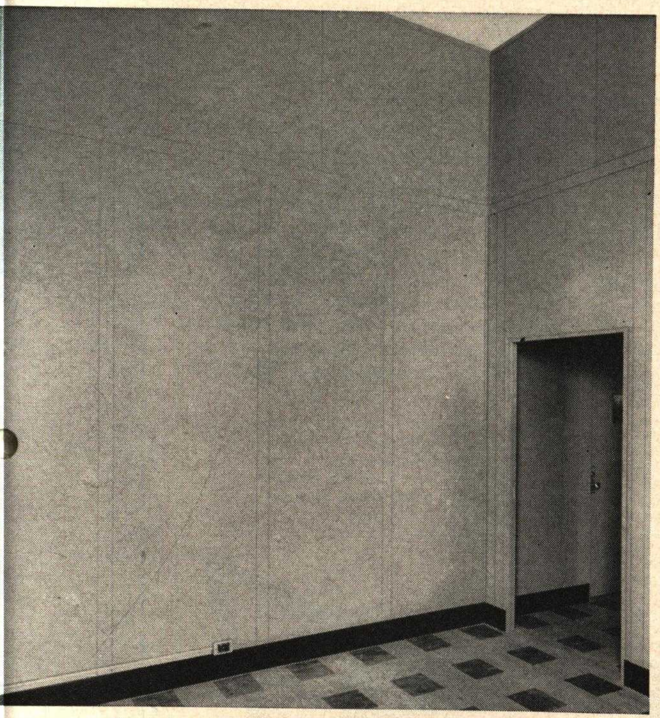
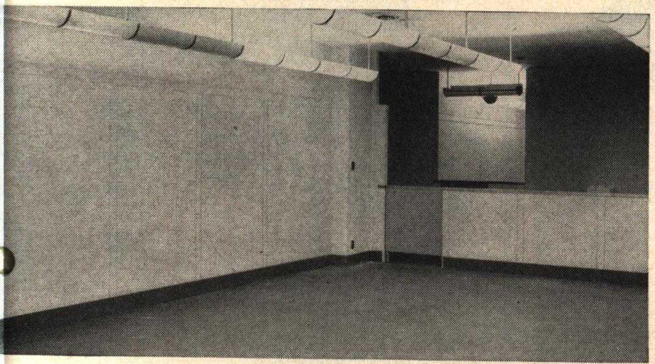
type JFF fire rated

STEEL PARTITIONS + JAMESTOWN, NEW YORK +

steel partitions



Flush type "JFF" fire rated partition 10'-2¾" high with double steel top filler. New York Telephone Co., Syracuse, N. Y.



Type "JFF" fire rated partition 7'-2¾" high with double steel top filler.

Fire rated steel partitions are available for use where an extra margin of safety is desired or required to meet building codes. Type JFF fire rated partitions comply with the American Society for Testing Materials, one hour fire test requirements, (standard specifications for fire test of building construction and materials E 119-55). The partition surpassed the minimum requirements for exposed side temperature of 1700° F, (927° C) as well as impact, erosion and cooling effect created by hose test.

Fire rated partitions 3⅜'' thick are similar in construction and appearance to our standard JFN partition with the necessary reinforcements and insulation added to meet the one-hour rating requirements. Standard panel units are listed below. Switches and receptacles not recommended in post condition.

Type ''JFF'' fire rated partitions are especially adapted to changing requirements, specifically corridor installations, in municipal buildings such as schools, office buildings, hospitals, city halls, institutions, and court houses. In addition, they have great potential in meeting the requirements in separating equipment rooms from office areas in telephone buildings, laboratories, and experimental areas.

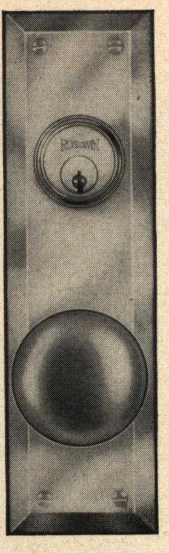
standard hardware

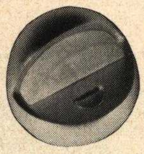


BERKELEY
Wrought Trim
Escutcheon 7" x 2¼"
Backsets 2¾" Lock Face 8" x 1¼"
Knob Dia. 2¼"

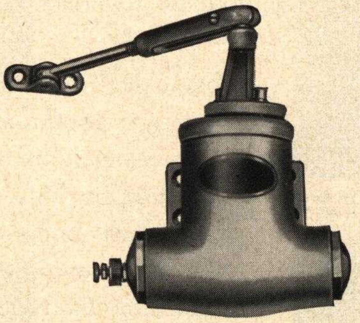
Steel Partitions' hardware was chosen for its high quality, modern design and flexibility. Using our Standard hardware prevents inevitable delays and added costs which result from use of non-standard hardware. We stock sizable quantities of our hardware. Our standard finish is U. S. 10 (dull bronze), however other finishes are available when specified. Flush Doors are provided with one pair standard 5" x 4" butts. Button tip butts are standard.

Russwin "10 STRIKE" locksets

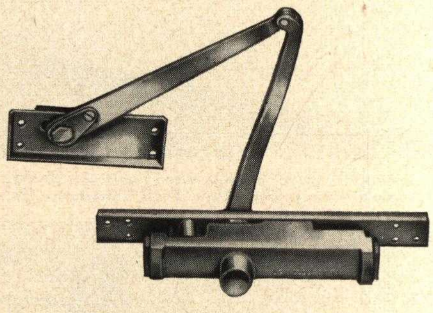
Russwin "10 STRIKE" locksets have been adopted as standard on all TYPE "JFN," TYPE "JL" and TYPE "E" door units because of their uniform quality, positive trouble free operation and amazing flexibility. They are so constructed that the locking function can be changed easily, quickly and inexpensively. All the interior working components are interchangeable and a simple rearrangement, usually without adding any additional parts, changes the locking mechanism to perform an entirely different function. This flexibility makes it possible to change the locks to meet new conditions when it is necessary to move or rearrange the partition. Like all Russwin locks, "10 STRIKE" locksets are precision made, with all interior working parts of heavy, rust resisting steel. Balanced knob action provides equal pressure on the knob in either direction, reducing all unnecessary strain on the working parts and assuring easy operation. The knobs and escutcheons are of wrought brass and are regularly supplied in the distinctive new "BERKELEY" design.



DOOR STOP SP 209½ low half dome cast bronze with 1⅛" solid rubber bumper. Height 1⅜".

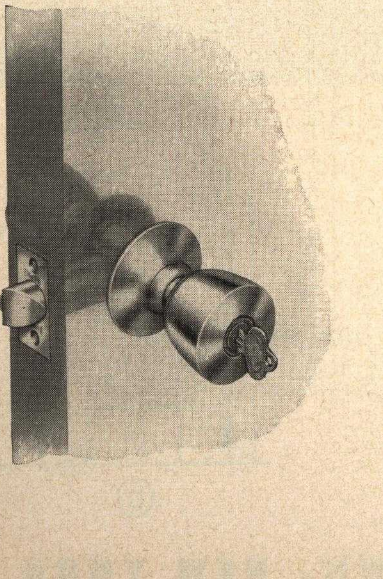


SURFACE DOOR CLOSER with cast iron case painted to match partitions or aluminum or gold bronze. In sizes B and C. Hold open arms are available when specified.



CONCEALED DOOR CLOSER type LCN 304 with cast iron case completely concealed in door. Exposed arm painted to match partition. Hold open arm available when specified.

cylindrical type locksets



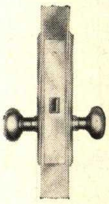
In addition to our standard mortice type hardware mentioned above, heavy duty cylindrical "key in knob" type hardware is available in both lock and latch functions. Trims other than shown are available when specified.

Although US-10 Dull Bronze Finish is standard, other common finishes will be furnished when specified. This hardware is extremely flexible to most master keying systems. Locks are reversible. Backset 2¾", Knob 2³⁄₁₆" dia., rose 2⅝" dia.

GATE HARDWARE
Rixson No. 356 cast bronze double and single acting hinge standard for glazed gates. A Chicago spring type double acting hinge standard for low gates. Secret gate catches available for either type. Gate pull plates or locks available when specified.

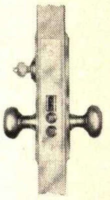
OTHER HARDWARE
Kickplates, Flush Bolts, Door Holder, push and pull plates, thresholds, transom and wicket hardware as well as slide door hardware furnished when specified.

functions



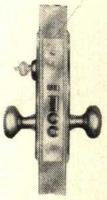
**10S-2025—
LATCH SET**

Latch bolt. Operates from either side by knobs. No dead bolt.



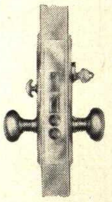
**10S-2038—
CYLINDER
LOCK SET**

Latch bolt operated from either side by knob except when outside knob locked by button. Key operates latch from outside.



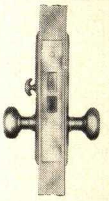
**10S-2056—
PICKPROOF
CYLINDER
LOCK SET**

Latch bolt by knobs. Outside knob locked by button and key. Auxiliary latch deadlocks latch bolt to prevent tampering.



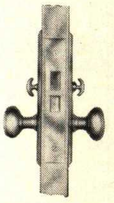
**10S-2048—
CYLINDER
LOCK SET**

Latch bolt by knobs. Outside knob locked by button and key. Dead bolt by key outside and turn piece inside.



**10S-2039—
SINGLE
COMMUNICATING
LOCK SET**

Latch bolt operated by either knob. Dead bolt by turn piece inside only. Emergency key outside.



**10S-2040—
DOUBLE
COMMUNICATING
LOCK SET**

Latch bolt operated by either knob. Each turn piece operates individual dead bolt.

NOW! MOVABLE WOOD PARTITIONS

Architecturally Designed **and at NEW LOW PRICES**

ECONOMICAL: Best of All! You can have Design Flexibility, Simplified Erection, adequate Wire Chases, the Beauty and Warmth of REAL WOOD with a modern flush appearance and with a durable Super Smooth Finish *at even lower prices than the usual office partitions of steel or wood.*

DESIGN FLEXIBILITY: Simplicity of design and unit manufacture (Base, Door, Panel and Cornice or Cap Units) offer a flexibility of Style, Type and Woods to fit all *your* needs.

SIMPLIFIED ERECTION: Triangle Partitions require no special tools to erect and can be quickly relocated by the *average maintenance man.*

WIRE CHASES: All 4 Types (Std. Office, Full Glazed, Bank and Low Rail Type) have two separate wire chases. Access to wire chases is available at all times thru the use of removable covers held in place with concealed fasteners and a unique method of interlocking joints.

WOOD FINISH: The Natural, Stained or Painted Factory Finish has a simulated hand rubbed, durable beauty that is easily maintained on any of the numerous species of woods that are available. This rich, luxurious smoothness, which also accentuates the natural beauty of the wood, is obtained by presealing all Doors & Panels with the new patented Super Microseal Process.

movable wood partitions

specifications

1. GENERAL

Furnish and erect complete Triangle Standard Office Type, Full Glazed Type, Bank Type, or Low-Rail Type (select types desired) Movable Partitions of wood as manufactured by Triangle Millwork & Supply Corp., Johnson City, N.Y. as required by plans and/or elevation layout.

2. SHOP DRAWINGS

Shop Drawings showing plan, typical elevations, special construction and installation details shall be submitted for approval.

3. WORKMANSHIP

Partitions shall be rigid, plumb, level and with all connections concealed. All hardware shall be in proper working condition. Partitions shall be manufactured by skilled craftsmen with close tolerances at all joints, shall be properly sanded and factory finished. Partitions shall be erected in good workmanlike manner.

4. STANDARD OFFICE TYPE PARTITIONS

Standard Office Type Partitions shall be flush veneered wood panels, 1¾″ thick 7′ 0½″ high (or with glazed panels) consisting of:

a. **BASE UNITS**—to consist of one center anchoring member and two exposed members of matching wood. Center anchoring member to be levelled, secured to the floor and shall provide a tongue for interlocking with all vertical units.

b. **CORNICE UNITS**—shall be of matching wood to run continuous over and interlocking with vertical panels to provide maximum rigidity. Twin raceways of approximately 2½ sq. in. each shall be provided in the Cornice Units to receive electrical and communication wiring. Raceways shall have removable sides interlocked with concealed fastening, thus providing complete accessibility for future wire changes. Cornice Units shall be rigid to support curtain walls or filler panels above the standard 7′ 0½″ height to the ceiling, if required.

c. **DOOR UNITS**—shall consist of a matching Institutional type flush 1¾″ door, factory hung into an interlocking matching wood frame with #241-FC 4 x 4 butts (1½ pr.) and standard with #310 latch set. (Locksets and/or Semi-concealed closers are available at additional cost.)

d. **PANEL UNITS**—shall be interlocking 1¾″ thick, flush varying from 18″ minimum to 48″ maximum width. They shall have standard thickness face veneers of 3-ply balanced panels bonded under heat and pressure by hot plate method over a core to assure a smooth, flat surface free of waves or dents.

e. **VERTICAL WIRING PANELS**—shall be interlocking and flush with matching face veneers. Wiring chase to be 3 sq. in. running full length of the wiring panel to accommodate wiring systems and their receptacles.

f. **STARTING PANELS**—shall be similar in construction to Wiring Panels and provided with anchoring device to effect attachment to permanent walls.

g. **CORNER PANELS**—shall be interlocking flush with matching face veneers and solid wood corner nosing.

h. **TEE PANELS**—shall be similar in construction to Corner Panels and shall be interlocking at all joints.

i. **CROSS PANELS**—shall be similar in construction to Corner Panels and shall be interlocking at all joints.

j. **STRUT PANELS**—shall be installed in otherwise unsupported partition runs of 14′ 6″ and multiples thereof to provide a rigid installation. Strut Panels shall be of solid hardwood core with hardwood edges and face veneers to match and shall have interlocking joints.

5. FULL GLAZED TYPE PARTITIONS

Full Glazed Type Partitions shall be identical with Standard Office Type utilizing the same units except the Panel Unit. The Full Glass Panel Unit shall be a matching, solid, mortised and tennoned frame of narrow stiles and rails for maximum glass opening, interlocked with the standard wiring panels or a slimline 1″ solid mullion. Glass may be ¼″ plate, patterned or corrugated and is secured with wood glazing beads.

6. BANK TYPE PARTITIONS

Bank Type Partitions shall be of flush veneered wood panels, 1¾″ thick 3′ 7″ high to top of cap unit with (12″ or 24″ high) glass panels added above cap and shall consist of:

a. **BASE UNITS**—(Use No. 4a specs. above.)

b. **CAP UNITS**—(select one or both of following:)

WIRING CAP UNITS—shall be of matching wood to run continuous over vertical panels and interlock with same to provide maximum rigidity. *Twin* raceways of approximately 1 sq. in. each shall be provided in the cap units to receive electrical and communication wiring. Raceways shall have removable sides interlocked with concealed fastening, thus providing complete accessibility for future wire changes. The cap shall be fitted to receive and support the Framed Glass Panels.

SOLID CAP UNITS—shall be of matching wood to run continuous, except at gate openings, over and interlocking with vertical panels to provide maximum rigidity. The cap shall be fitted to receive and support the Framed Glass Panels.

c. **GATE UNITS**—(select one or both of following:)

UNGLAZED GATE UNITS—shall consist of gate, jambs and hardware. Gate shall be flush panel type construction of matching woodfaces and edges together with a Solid Type Cap of matching wood. 1⅛″ thick solid jambs of matching wood shall be securely attached to the partitions. Hardware to consist of 1 pair, #241 F. C., 4 x 4, mortise butts (Self-Closing Hinges, #11½ M-US3, are available if desired, at an additional cost) and RB 656-US3 Secret Gate Catch, mill fitted and installed.

GLAZED GATE UNITS—shall include a complete Unglazed Gate Unit and a Framed Glass Panel, matching those in the partitions, rigidly mounted on top of gate and securely attached between solid wood extension stiles.

d. **PANEL UNITS**—(Use No. 4d specs. above)

e. **VERTICAL WIRING PANELS**—(Use No. 4e specs. above)

f. **STARTING PANELS**—(Use No. 4f specs. above)

g. **CORNER PANELS**—(Use No. 4g specs. above)

h. **TEE PANEL UNITS**—(Use No. 4h specs. above)

i. **CROSS PANEL UNITS**—(Use No. 4i specs. above)

j. **T-BAR ANCHORS**—shall be installed at gate units and/or in otherwise unsupported runs of 14′ 6″ and multiples thereof. T-Bar anchors to consist of ½″ thick steel bar 3 ft. high, concealed within and fastened to the partition and welded to ⅜″ thick steel floor plate of not less than 18 sq. in. bearing surface, securely anchored to the floor.

k. **FRAMED GLASS PANELS**—shall consist of matching wood frame, plastic glazing strip and glass. The wood frame shall be open top, ploughed 3 sides to receive the plastic glazing strip and glass, and shall be rigidly mounted on the Cap Units. Each frame shall be securely connected to the adjoining Framed Glass Panels, corners or intersecting panels. The plastic glazing strip shall be neatly fitted into the ploughed frame for rattle-free installation of the glass which shall be clear flat drawn, or "Pluralite" obscure, as required, with seamed top edges and set firmly into the plastic glazing strips.

7. LOW-RAIL TYPE PARTITIONS

Low-Rail Type Partitions shall be of flush veneered wood panels, 1¾″ thick, 3′ 7″ to top of Cap Units and shall consist of:

(insert paragraphs 6a through 6j under specifications for Bank Type Partitions above *but delete all references to glazing.)*

8. FINISH

All doors, Panels, and Trim Units shall have standard factory rubbed finish, natural or stained or painted. All doors and panels shall be presealed with the new Super Micro-Seal Surface Process* (Pat.—G.P.C.) for permanent easily maintained smoothness.

Note: Triangle Millwork & Supply Corp. reserves the right to change specifications and details at any time and without notice.

COLORLINE PARTITIONING
gives unlimited freedom of design

COLORLINE partitions have made possible a new vogue in space dividing. Architects and designers are turning out attractive, colorful, low cost modern partitions with UNISTRUT® framing, which gives them unlimited freedom of design, colors, textures and patterns. It also meets today's need for a permanent or movable wall that can be erected, dismantled, and re-erected with minimum time and labor, and with complete salvage of materials. Also sound-retarding and strong but not bulky.

Long used and proved in thousands of applications as a versatile, quick-erected system of mechanical supports, UNISTRUT adjustable metal framing now brings you the same advantages you can use to erect all types of partitions, using simple tools, stock UNISTRUT parts, standard or special paneling materials and glass, from ⅛″ to ½″ thick.

Sold through "UNISTRUT" Distributors

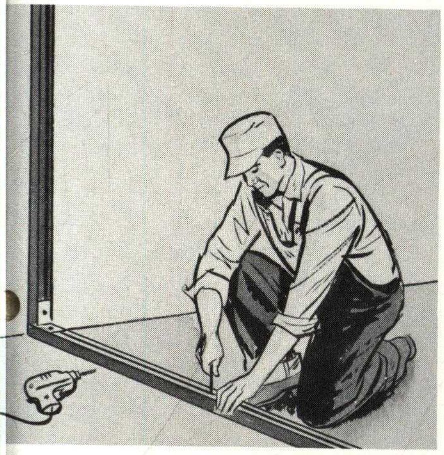
All UNISTRUT materials are obtainable through your nearest UNISTRUT Distributor who maintains a complete stock. There are no delays in getting materials at any stage of the job—no waiting for extra parts "from the factory."

Your UNISTRUT Distributor is listed in your local telephone directory.

UNISTRUT PRODUCTS COMPANY • 933 W. Washington Boulevard
Chicago 7, Illinois • MOnroe 6-2665 • Teletype CG 1329

THE SYSTEM

The ColorLine system by very nature of its simplicity and flexibility, allows freedom of design.

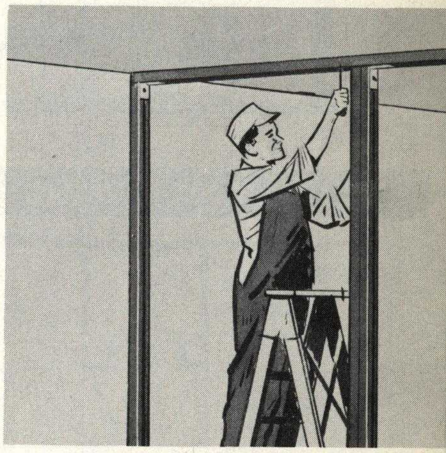


1. Fasten the floor channel wherever you wish your partitioning to run.

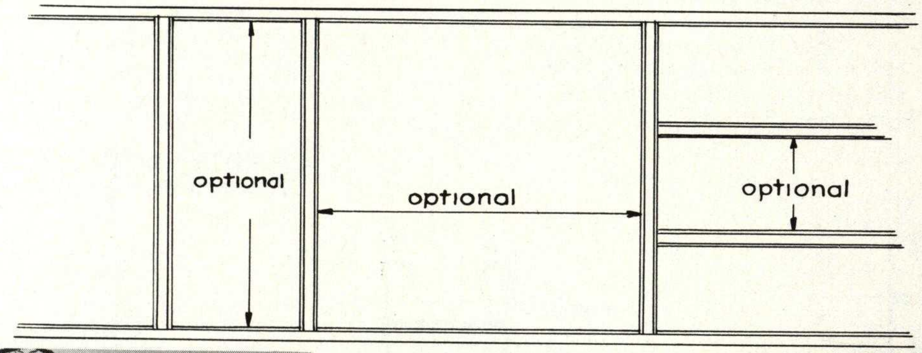
←

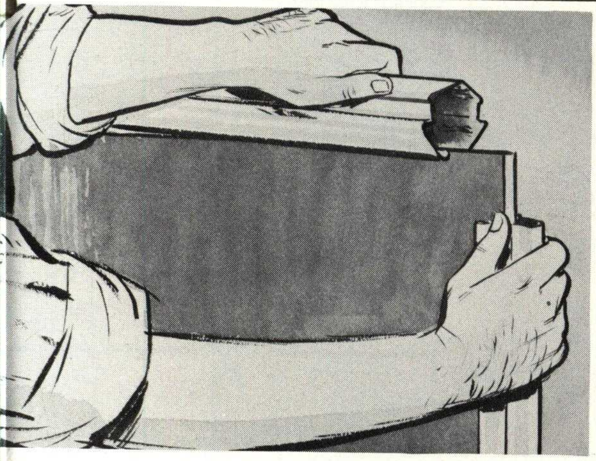
2. Using the P-2582 right angle fitting (detailed on Page 4,) bolt your uprights, horizontal dividers and top members in place wherever you want them.

→



3. The result is a steel framework of rectangular openings into which you can insert a wide variety of paneling to obtain your desired effect.



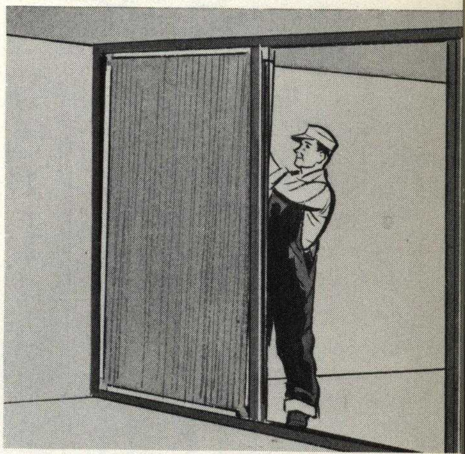


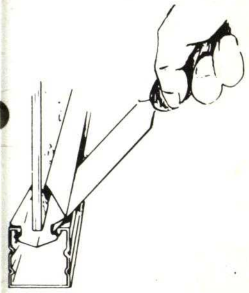
4. To insert panels, first slip moulding P-2584 (detailed on Page 4) on all four sides of the panel.

←

5. Then place panels with moulding fully on panels into the rectangular openings.

→





6. Snap moulding into slot in channel, as shown. The panel rests at the bottom on the right angle fitting and is retained on all four sides by the moulding.

←

7. To give a finished appearance put on the appropriate P-2571-3-5 corner cover plate (detailed on Page 4).

→

FRAMING DETAILS—DESIGN NOTES

Layout plans are based on modules 2″ wider than panel dimensions (4′2″ for 4′ wide panel material). A variation of $^{13}/_{16}$″ occurs, when panels are all uniformly sized, due to wall studs and intersections (see below and intersection details).

ADDITIONAL INFORMATION:

(1) Bracing—when a straight run of ColorLine Partitioning exceeds 13 feet, a through post to the ceiling or the addition of a stiffening member on the top rail is recommended.

(2) Electrical requirements may be handled by two methods:

a. Use multiple UNISTRUT channel P-42002 (Intersection Detail E Page 5) and utilize center section as wire raceway. Switch and receptacle cover plates are UNISTRUT Part P-2530—switches and receptacles are Arrow-Hart & Hegeman, QT1, QT3 and TI320 or equivalent by Pass & Seymour, Inc.

b. Surface wire raceways may be run along floor line with "T" connections and raceways running up studs for receptacles or switches.

(3) Glazing is accomplished in the same manner as paneling with addition of rubber tape over area where glass rests on the P-2582 corner angle.

(4) Non-combustible partitioning may be created by using cement asbestos paneling material and rated wire glass.

(5) Panel thickness variations are made possible by P-2584 moulding (Detailed Page 4) which expands to accommodate thicknesses of ⅛" to ½" inclusive.

(6) Sound Attenuation — Independent laboratory tests have proven that the ColorLine Partitioning offers excellent acoustical qualities.

UNISTRUT materials are protected by the following patents and other patents pending:

movable partition specifications

GENERAL

ColorLine Partitioning shall be supplied and erected complete as indicated on architectural drawings. All ColorLine components, panels, doors, hardware, glass and miscellaneous parts shall be included. Details and erection methods shall be in accordance with manufacturer's standards.

Special effects, as detailed in the architectural drawings, must be maintained.

SHOP DRAWINGS

Shop drawings showing plan layout, typical elevations and construction details shall be submitted for approval before proceeding with the work.

MATERIAL

The ColorLine Partition System consists of steel framing of no less than 16 gauge, cold rolled, bonderized steel. Components shall be as specified in manufacturer's catalog.

SYSTEM

The ColorLine Partition System can be assembled to contain paneling material of any specified width and height and of any thickness, from 1/8" to 1/2" inclusive.

The ColorLine System permits removal and replacement of any panel without disturbing the steel framework or other panels.

PANELS

The panels are to be installed by the partition contractor in accordance with the manufacturer's standards.

Where special paneling effects are desired, careful selection has been made regarding quality, texture, size, thickness, etc. and clearly indicated on architectural drawings.

GLAZING

Glazing shall be done in accordance with the manufacturer's standards. The partition contractor shall be responsible for proper glazing. The glass shall be of the type and thickness as indicated on the architectural drawings.

DOORS & HARDWARE

Doors and hardware shall be installed by the partition contractor in accordance with the manufacturer's standards. A schedule in the architectural drawings indicates type of doors, sizes, styles, finishes, and indicates hardware specifications.

FINISH

ColorLine movable partitions offer an unlimited variety of color, finish, texture, and design. Careful adherence to the color schedule, as indicated on the architectural drawings, must be maintained.

Sample color and panel swatches, if other than a manufacturer's standard, shall be submitted for approval.

WORKMANSHIP

When completed, walls shall be straight and plumb with horizontal members level. Hardware shall be adjusted. The walls shall be neat in appearance and free from defects. Working area shall be left broom clean.

QUOTATIONS

When a system is quoted "as equal", a letter must accompany shop drawings clearly indicating exceptions to the above standards and the requirements indicated on the architectural drawings.

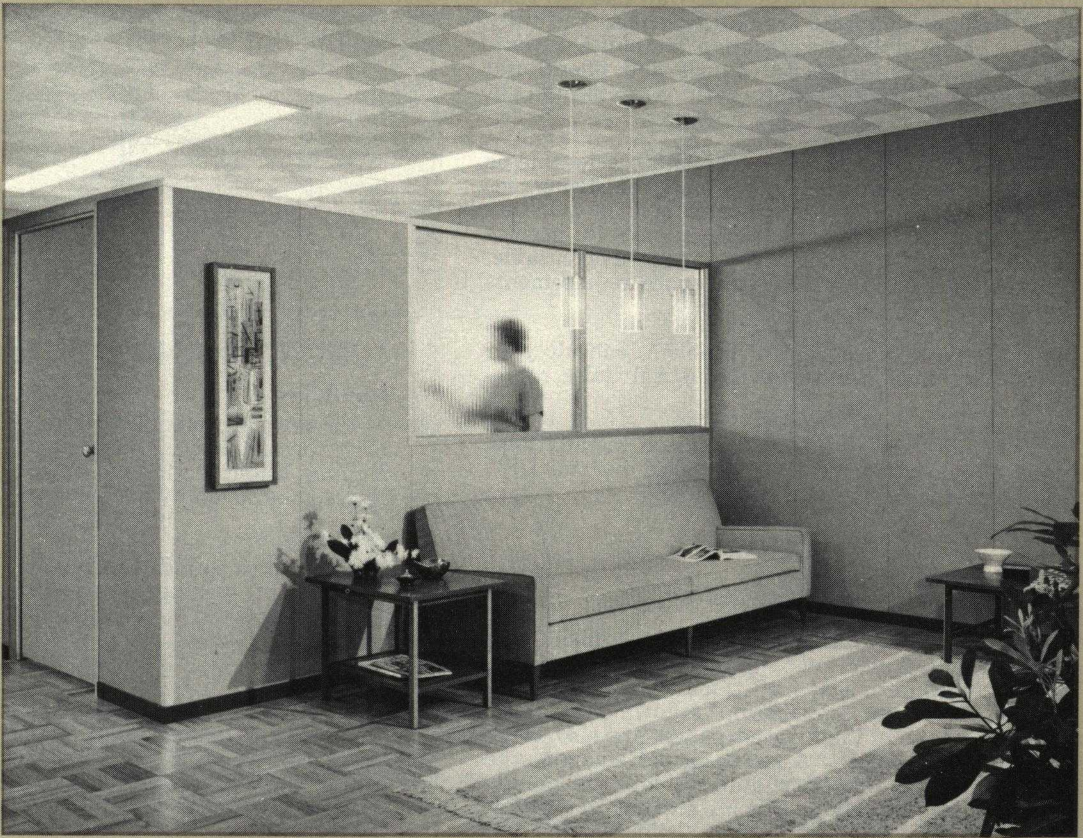
E-Z WALL

MOVABLE PARTITIONS



UNITED STATES GYPSUM

1960

E-Z WALL
MOVABLE PARTITIONS

simplified planning, construction and relocation

The E-Z Wall "Simplicity" design offers the best and fastest solution to space control problems in offices, commercial buildings and institutions.

In contrast to other movable partition systems that require up to 350 separate parts, E-Z Wall has less than 30 parts! Basic components are multi-purpose and fully modular. This modular construction simplifies layout, eliminates the need for special panels and fillers, and permits on-the-job adaptation with a minimum of cutting.

E-Z Wall partitions are as attractive and serviceable as permanent installations. They are made of strong, incombustible laminated gypsum board, held in place by open web steel studs that provide raceways for service wiring and piping. E-Z Wall partitions are always reusable, and may be relocated easily when space requirements change.

When you have a space control problem, consult your local USG Architect Service or Industrial Sales representative.

E-Z Wall layout, and estimates for initial installations, additions or relocations will be furnished by the USG Partition Contractor without obligation.

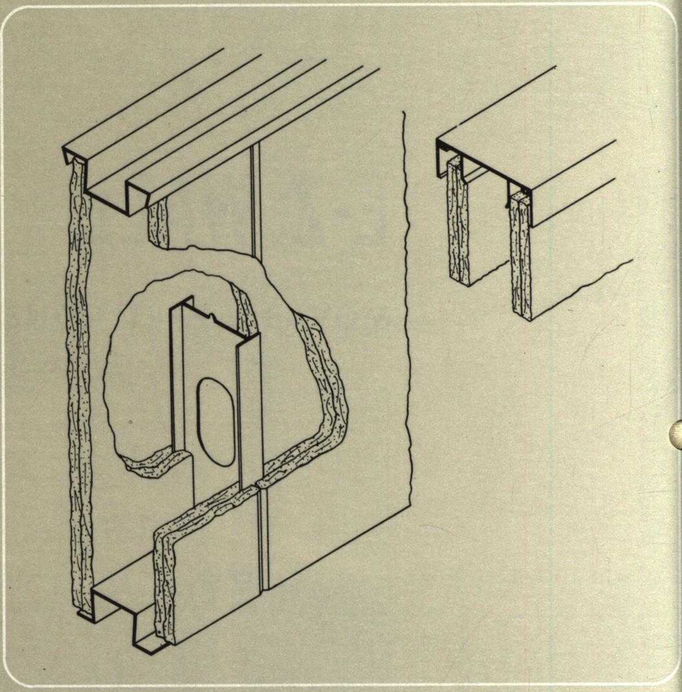
DESCRIPTION

E-Z Wall partitions are flush-panel-type, 3⅜″ thick. Each panel consists of two pieces of ⅜-inch thick gypsum board, mill-laminated to form a ¾-inch thick sheet in standard form ready for paint application following standard painting procedures. (Vinyl faced panels are also available in 3 standard colors.) A roll-formed H-shaped stud holds panels in place (flanges of stud slip into the lamination of the panel). Partition units are erected on a simple hat-shaped, continuous floor runner. Ceiling-height partitions are inserted into a ceiling runner. Openings for windows and door frames are standard extruded aluminum sections. (See diagram.)

Sizes and Types

Railing Height Partitions available up to 48″ in height. May be furnished with a finished rail cap or with glass above the rail.

Cornice and Ceiling Height Partitions available to a maximum of 10′. May be furnished solid, with windows, or in continuous glass variations. Window sizes are fully flexible in both height and width without the use of special parts.



FUNCTION AND UTILITY

Flexibility

Multi-purpose, modular parts are used in all types of partitions (no special panel sizes or fillers are necessary). Railing heights, window sizes, and door sizes may be revised on the job without special parts or extensive labor.

Sound Control

Resistance to sound transmission of the basic partition, exclusive of openings, is equivalent to, or greater than, the loss reported for some wood stud-gypsum lath and plaster partitions.

Fixtures

Open-web steel studs provide ample raceways for wiring. Outlets may be cut into panel and located for convenience. Wall-hung fixtures—lights, chalkboards, and other lightweight fixtures may be attached directly to panels.

Fire Resistance

All materials in E-Z Wall partitions—gypsum board, steel structural members, aluminum trim—are incombustible.

Maintenance

All exposed aluminum members are etched and anodized to provide a neutral gray finish that requires little maintenance. The optional vinyl plastic-faced panels, integrally decorated in a choice of 3 U.S.G. standard colors, may be washed with mild detergent.

LIMITATIONS OF USE

E-Z Wall partitions should not be used as load-bearing members, or where they are exposed to excessive moisture.

SPECIFICATIONS

scope

Furnish and erect E-Z Wall partitions as indicated on the plans and specified hereunder. Partitions are to be flush-panel-type, 3⅜″ thick, (railing, cornice, and/or ceiling height) as supplied by the United States Gypsum Company.

shop drawings

Shop drawings showing layout and details of construction, when required, shall be submitted for approval.

materials

A. Laminated gypsum board panels shall be ¾″ thick by 24″ wide by appropriate height. The panels shall have accurately formed off-set edges for concealed attachment to steel studs.

B. Steel studs shall be open web type, formed from 23-gauge electro-galvanized steel.

C. Floor runners (and ceiling runners in ceiling height partitions) shall be formed from 23-gauge electro-galvanized steel. Floor and ceiling runners shall have formed-in spacers to hold panels in alignment. (Ceiling runners shall have integral trim to conceal top edges of panels.)

D. Base trim shall be 18-gauge, 2½″ high, with 7/16″ projection. Base trim shall be snapped on over 18-gauge base trim clips, provided at maximum spacing of 24″.

E. Door frames shall be formed of an extruded aluminum door buck and an extruded aluminum insert. Door bucks shall provide a finished opening into which an insert is fitted to provide door stops and hardware mortises. Wood doors, furnished by partition contractor, shall be 1¾″ thick by appropriate width up to 3′0″ by 6′8″ high. Continuous removable plastic strikes shall be provided for quiet operation of doors and to lessen sound transmission.

F. Door hardware consisting of three 4½″ by 4½″ butts and key-in-knob lock shall be furnished in US 28 finish by the door supplier. (Door frames equipped for special hardware available at slight extra cost.)

G. Window frames shall be of sizes indicated on the plans and shall be built up from standard extruded aluminum parts. Glass shall be furnished by the partition contractor and shall be set in plastic glazing channels colored to match the window frame.

finish

A. Laminated gypsum board panels shall be supplied with a mill-applied vinyl plastic film. Film shall be integrally colored and shall be embossed. Color to be a standard U.S.G. color, as selected.

or

Laminated gypsum board panels shall be supplied with a manila-finished paper surface ready for field decoration. (If painting is to be part of the partition work, include complete painting specifications.)

B. Exposed aluminum members shall be etched and anodized to provide a permanent finish of neutral gray color.

installation

Lay out the partition and locate all floor attachment clips for end posts and door frames. Floor runners and floor attachment clips shall be securely anchored to the floor. Assemble and install cornice and/or rail and/or ceiling runner. Install gypsum board panels, studs, and trim members in accordance with U.S.G. installation methods.

workmanship

The finished partition shall be rigid, plumb, with horizontal lines leveled; neat in appearance, and free from defects in workmanship. All connections to walls, floors, ceilings, cornice sections, and connections between gypsum board panels shall be concealed. If doors are hung by the partition contractor, hardware shall be adjusted to proper working order.

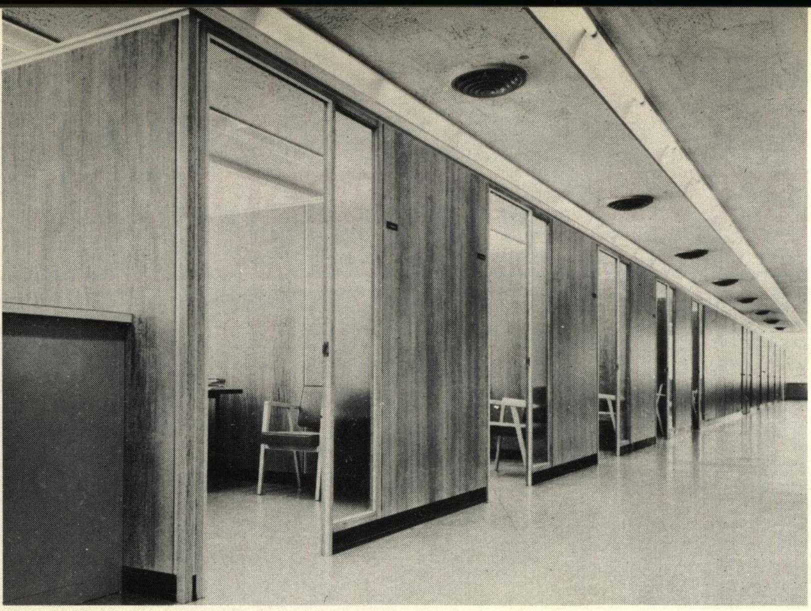
DECORATIVE · FLEXIBLE

WELDWOOD®

Movable Partitions

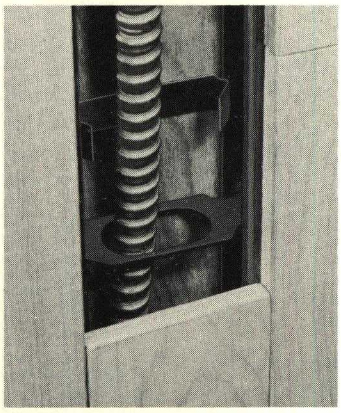
UNITED STATES PLYWOOD CORPORATION

A. I. A. FILE NO. 36-H-6, JANUARY 1960



Design 102 Korina Weldwood "Stay-Strate" Movable Partitions in Greyhound Office Building, Niles, Illinois. Units are modular for complete interchangeability.

weldwood movable partitions



Hollow post provides useful space for electrical and telephone wiring.

Weldwood Movable Partitions combine low-cost flexibility (complete movability) with your choice of partition faces: natural hardwood, fabric-like plastic, high-pressure plastic laminate, or Color-Styled Novowall. Each of these panel faces offers certain liberties to the decorator—and certain physical characteristics which contribute to economy and long, useful life. Complete movability—the total freedom of redesigning floor space allotment—is assured with Weldwood Movable Partitions. Weldwood's exclusive metal key construction locks the partition panels into a solid wall. Yet, they can be quickly and easily dismantled and rearranged in a few hours. There are so few parts involved that Weldwood Movable Partitions can be erected, dismantled, moved and re-installed by regular building maintenance crews. (A complete or partial installation service is also available, if you specify.) Weldwood Movable Partitions are the perfect solution to the problem of room sub-dividing in offices, schools, hospitals, stores, banks, and dozens of other interior installations.

EXCLUSIVE ADVANTAGES

Flexibility—metal key locking systems—all parts interchangeable—all parts salvageable.

Flush design—post connector cap fastened invisibly from within—cap matches panel faces.

Your choice of beautiful, durable face materials—The following face materials are standard with Weldwood Movable Partitions:

- beautiful, furniture-finish natural wood (see page 4).
- colorful, fabric-like plastic (see page 4).
- durable, decorative, high-pressure plastic laminate (see page 4).
- economical Novowall (see page 5).

Your designer can also take advantage of matching wood or aluminum glazing channels, post covers and ceiling channels.

Incombustible Weldrok Core—dimensionally stable, warp-free, incombustible, rot-free.

Interchangeability—All partition panels and door units of the same modular width are completely interchangeable. All component connection parts are 100% re-usable, aiding in future layout revisions.

Sizes—Modular panel widths up to and including 6′-0″ x 12′-0″, with one-piece face (veneer) construction, in any intermediate increment size are available. This provides practical unit sizes for use in today's modern, large, modular building trend.

Accessible concealed wiring—Provisions have been made to accommodate concealed electrical wiring in the base, post and cornice.

Light in weight—Weighing only 4 lbs./sq. ft., approx., this system assures ready movability by regular maintenance crews. No external bracing or extensive preparatory construction or alteration is necessary.

Low maintenance—Nothing to replace in normal usage; you are ensured, at minimum cost, complete utilization of available floor areas in any type building. Panels and post caps need only the minimum care you would expect to give hardwoods, vinyl fabrics, or high pressure plastic laminates. Should wood veneers be accidentally damaged or even fractured, "invisible" repairing and refinishing are economically done without removing damaged panel from the wall.

Warp-free doors—Weldwood Stay-Strate Doors (with the incombustible Weldrok core) are available to complete the installation.

WELDWOOD WELDROK CORE PARTITION PANELS

Weldwood Movable Partitions are designed with the Weldwood Partition Panel which features the new Weldrok® incombustible core. This sub-dividing panel offers the richness of real hardwood partitioning without the disadvantages of fire hazard (due to Weldrok core's being incombustible), warpage, shrinkage, swelling, etc. It can be used for nearly every type of room partitioning.

SPECIAL FEATURES

BEAUTIFUL FACES: Weldwood Partition panels are faced one or both sides with fine hardwood veneers, with vinyl-fabric, and with plastic laminate, as you specify, to complement modern, traditional and contemporary architecture and furnishings. Panels faced differently on each side may also be obtained, to give partitioned areas their own individualized decorative 'walls'.

FIRE-RESISTANT: An important feature of the Weldwood Partition Panel is the Weldrok core—the same core material used in the famous Weldwood Fire Door. This revolutionary mineral core material is incombustible, inert and extremely homogeneous. It provides a core which is light in weight, strong and dimensionally stable.

EXCEPTIONALLY STRONG AND RESILIENT: An 8,000 lb. weight test—2,780 lb./sq. in.—shows the remarkable resiliency and strength of the Weldwood Partition Panel. This is especially important in offices, for instance, where furniture, filing cabinets, etc., are occasionally moved against these walls.

LIGHT IN WEIGHT: This partition panel weighs less than 4 lbs. per sq. ft.

WILL NOT DELAMINATE: Waterproof film phenolic resin glue is used to permanently bond the faces and crossbands to the core. This provides extra protection, even under the most severe service conditions.

WARP-FREE: The inert Weldrok mineral core assures that the panels will remain warp-free and stable.

INSULATION FACTOR: The U-factor of the Weldwood Partition Panel is approximately .35 BTU/hr./sq. ft./F°.

LOW MAINTENANCE: No costly painting or re-decorating with Weldwood Partition Panels. An occasional cleaning and waxing is the only maintenance needed.

GUARANTEE

Weldwood Weldrok-core Partition Panels, when properly installed under normal service conditions, are guaranteed against manufacturing defects for the "Life of the Installation."

Should any Weldwood Weldrok-core Partition Panel fail to meet these standards, in an original installation, United States Plywood Corporation will replace said Partition Panel including erection and finishing without cost to the owner.

SPECIFICATIONS FOR WELDWOOD WELDROK-CORE PARTITION PANELS

All panels (as indicated) shall be Weldwood Partition Panels as made by the United States Plywood Corporation.

Panel Faces—(Here, use appropriate specification for "Stay-Strate", Custom Royal, or Custom-Clad panels . . . see page 4.)

Cross bands — Cross bands shall be thoroughly kiln-dried hardwood, 1/16" thick and extending the full width of the panel.

Core — The core shall be made of WELDROK, which is an incombustible mineral material having a nominal density of 20 lbs. per cubic foot, consisting of hydrous calcium silicates with asbestos fiber binder. The core shall be smoothly sanded prior to application of cross bands and faces.

Factory-machined edges — The panel edges shall be factory-machined to suit the job requirements. Edge treatments such as square sawn, rabbetted, tongue-and-grooved for wood or metal spline can be furnished.

Edge bands — Edge bands 1⅜" thick shall be made with two pieces of ¾" glued up kiln-dried hardwood and securely resin glued to the core. The long edge bands shall extend the full length of the Partition Panel with the short edge bands cut in between them.

Adhesive — The core, crossbanding and faces shall be bonded together with waterproof film phenolic resin glue by the hot plate process.

Sanding—Both faces shall be smoothly belt sanded before leaving the factory.

Sizes — With face veneer running long way, widths to 6'-0" and heights to 12'-0"; with grain running short way, widths to 12'-0" and heights to 6'-0".

Weldwood Partition Panels

WELDWOOD "STAY-STRATE"® PARTITION PANELS

Combines the Weldwood Weldrok-Core Movable Partition Panel with the natural beauty of hardwood.

Weldwood Stay-Strate Partition Panels are faced both sides with fine hardwood veneers that complement both traditional and contemporary architecture and furnishings. Standard thickness (1/28″ to 1/20″) face veneers are always used. Their superiority of appearance and performance is attested by thousands of architects and owners of all kinds of buildings. The standard face veneers are Birch, Korina, Walnut, or other fine woods on special order such as Mahogany, Oak, Maple, etc. Panels may also be obtained with different species on each face.

HOW TO SPECIFY: In Section E of Weldwood Movable Partitions Suggested Specifications, (see page 10), substitute:

1. Panels—Shall be Weldwood Stay-Strate Partition Panels with WELDROK core as manufactured by the United States Plywood Corporation. The thickness shall be 1¾″. The face veneer shall be (specify species required or paint grade, if partition is to be painted). The long edges of the panel shall be grooved and a .040 steel channel applied to each edge.

WELDWOOD CUSTOM ROYAL PARTITION PANELS

Plastic-faced Weldrok-Core Partition Panels for schools, hospitals, institutions.

The decorative Weldwood Custom Royal Partition Panel combines the unsurpassed durability and beauty of high pressure plastic laminates with the stability and strength of the Weldrok-core panels. It offers clean, ever-bright and completely sanitary partitions that are useful for all rooms and areas. Its surface never requires polishing or refinishing—a whisk of a damp cloth instantly wipes away dust, grease and finger prints.

Maintenance-free beauty is locked for life beneath a super-tough skin of clear melamine in the case of Micarta. Micarta is actually harder than marble—with superior resistance to dents, gouges and scratches.

The Weldwood Custom Royal Partition Panels are recommended for use wherever a combination of beauty *plus* extreme durability is desired. The reflective value of Micarta is carefully controlled in three finishes: gloss, furniture finish, and satin. Available in a full range of colors, patterns, and even authentic-looking wood grains, in Micarta as well as other decorative high pressure laminates.

HOW TO SPECIFY: In Section E of Weldwood Movable Partitions Suggested Specifications, (see page 10), substitute:

1. Panels—Shall be Weldwood Custom Royal Partition Panels with Weldrok core as manufactured by the United States Plywood Corporation. The thickness shall be 1¾″. The face shall be (specify manufacturer's color and pattern number). The long edge of the panel shall be grooved and a .040 steel channel applied to each edge.

WELDWOOD CUSTOM-CLAD PARTITION PANELS

Combines the flexibility of the Weldwood Movable Partition with your choice of tough, decorative vinyls, fabrics and special surfaces for hospitals, hotels, schools, restaurants, theatres, offices, etc.

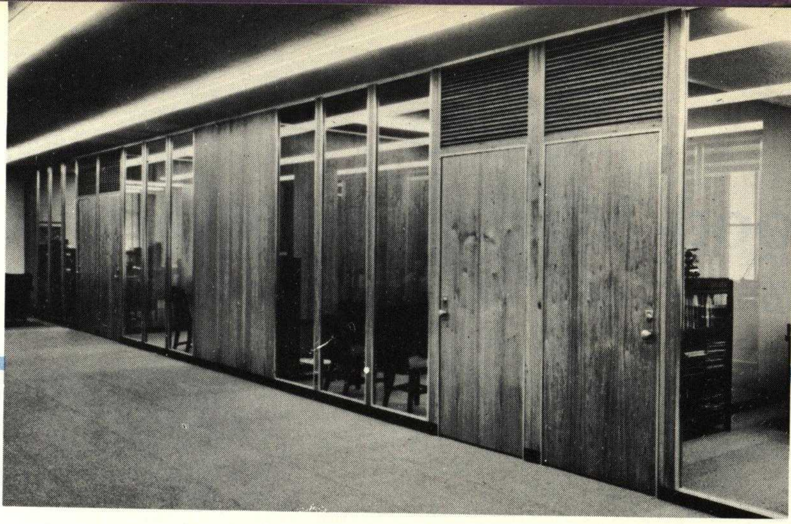
The Weldwood Custom-Clad Movable Partition is an excellent interior partition for use where rough, tough treatment is encountered, and where color and an exciting atmosphere are desired. Weldwood Kalistron, vinyl films and a full list of other coated fabrics and special-purpose materials can be specified on this Weldwood Weldrok Partition Panel construction.

Panel construction is with Weldrok core—to be stable and strong and age-resistant—and with regular Weldwood metal key interlock system for the ultimate case of rearranging floor areas.

WELDWOOD KALISTRON: Kalistron is completely wear-resistant: the color is permanently fused to the underside of tough, transparent sheeting. Tests show that Kalistron is 10 to 17 times as resistant to wear and abuse as battleship linoleum. Because it contains no filler or scrap material and is calendered sheeting, Kalistron has great tensile strength. Kalistron is also highly resistant to most common staining agents and is extremely simple to maintain. Surface dirt may be removed with ordinary soap and water.

HOW TO SPECIFY: In section E of Weldwood Movable Partitions Suggested Specifications, (see page 10), substitute:

1. Panels—Shall be Weldwood Custom-Clad Partition Panels with Weldrok core as manufactured by the United States Plywood Corporation. The thickness shall be 1¾″. The faces shall be (specify Kalistron RCL number, color and pattern, or particulars of other face material). The long edges of the panel shall be grooved and a .040 steel channel applied to each edge.



General Motors Building, Detroit, Michigan

WELDWOOD FIRE-RETARDANT PARTITION PANELS

Decorative, fire-resistant movable partitions

Faces Decorative hardwoods, plastic laminates, vinyls, fabrics, or special surfaces.

Construction Special edge bands on Weldwood Stay-Strate, Custom Royal, and Custom-Clad Partition Panels (see page 4).

Approval Local city approvals available on request.

Alternate Construction Identical to the famous Weldwood Class "B" 1-hour Fire Door.

Approval Each panel bears proper certification of the mill.

The Weldwood Fire-Retardant Partition Panels have the well-known Weldrok incombustible mineral core and are edge-banded at the mill with Protexol Class "A" treated lumber.

Connectors and post caps can be specified as Design 100, Design 101, Design 102, or Design 103—and offer the same advantages of utmost movability with salvageable parts and components.

To complete the installation, Weldwood Fire Doors should be specified.

WELDWOOD NOVOWALL PARTITION PANELS

Weldwood Novowall Partition Panels combine economical, stable Novowall with the features and advantages of Weldwood Movable Partition System.

This movable partition, developed for the lower budget field, provides factory prefinished panel sections of decorative Novowall . . . with its wood mosaic surface stained or finished natural, or with beautiful color styling to your specification.

DESCRIPTION

Novowall (1¾″-thick Novoply®) is a unique all wood 3-ply board of balanced sandwich construction consisting of a dense outer surface of specially prepared wood veneer flakes, a lower density core of medium sized chips and another higher density layer of flakes. These flakes and chips are resin-coated and, in 3 layers (or plies) under heat and pressure, are simultaneously fused and formed into smooth, flat, uniform panels. Since Novowall has no wood grain direction, with the flakes and chips at a multitude of cross angles to one another, it is outstandingly flat, dimensionally stable and free from warp. As the surface is impregnated, it has excellent resistance to abrasion.

Novowall utilizes the Weldwood Movable Partition Connection System to insure a true flush partition.

No color limitations — Any color can be specified on Weldwood Novowall Partition Panels. Thus the designer has complete freedom to combine true colors and their tints in any combination he desires for decorating and for lighting.

This freedom of color choice is becoming most important in all types of buildings—color applied to satisfy scientific concepts of its ability to influence moods and reactions of workers, visitors, customers, patients and students.

Novowall panels are altogether interchangeable with the Weldwood Weldrok-core panels (hardwood, plastic-fabric, and plastic laminate faced). When floor layouts change, it is entirely feasible to combine Novowall panels with other Weldwood Partition Panels into interesting and satisfactory wood/color/plastic combinations.

Weldwood Novowall Partition Panels do not limit room design and decorating. For example, a flush corridor partition could be a light shade of brown or green colored Novowall to softly reflect light from a minimum size fixture, while the reverse of the partition, in an executive office, could be stained walnut. An endless variety of suitable combinations can be planned for any area in any type building.

HOW TO SPECIFY NOVOWALL

In section E, Materials, of Weldwood Movable Partitions Suggested Specifications (see: page 10) substitute:

1. Panels — Shall be Weldwood Novowall Partition Panels as manufactured by the United States Plywood Corporation. The thickness shall be 1¾″. The faces shall be decorative Novowall. The long edges of the panel shall be grooved and a .040″ steel channel applied to each edge.

GENERAL NOTES

1. Panel Widths—Panels up to 4'0" wide are stocked. However, panels are readily available in any increment up to 6'0" wide. Panel widths are 2¾" less than module to accommodate wiring, connections, etc.

2. Panel Heights—Up to and including 12'0" height. Additional ceiling heights accomplished in two piece construction.

3. Door Widths—All standard door sizes available. Door module is 6" greater than door size to accommodate jamb, wiring, connection, etc.

4. Reinforcements to ceiling or other bracing shall be provided on runs over 16' in length when unsupported by cross runs.

5. All wiring may be concealed. Electric outlets and switches may be located in base, posts or cornice.

Weldwood Movable Partitions

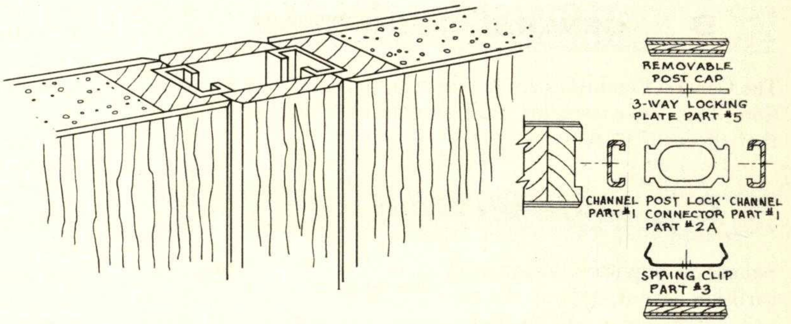
VARIATIONS FROM DESIGN 100 (pp. 6, 7, 8)

Architects' and designers' concepts may very well differ somewhat from the popular and most often specified Design 100 Weldwood Movable Partitions with their very attractive 2¾"-wide Flush Post Caps. To accommodate other designs, several attractive, useful variations of posts and caps are standard.

In addition to these three standard design variations, the experienced members of United States Plywood Corporation's and the Weldwood Movable Partition Distributors' staffs are always available to discuss any design custom details which will produce the desired individualistic effect.

DESIGN 101 WITH 1¾" FLUSH POST CAP

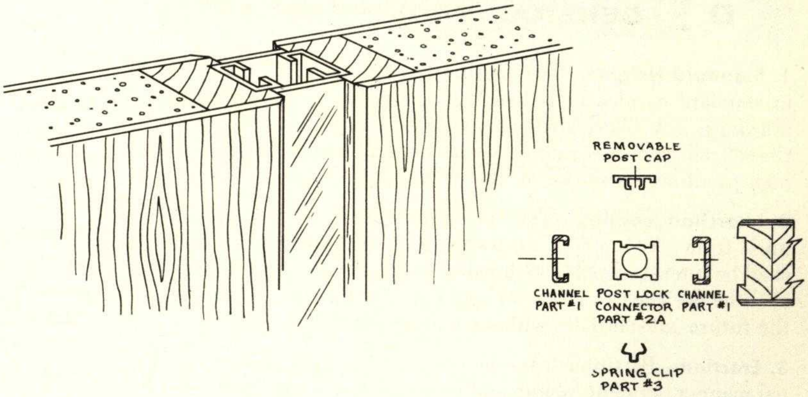
Very similar to Design 100 in appearance except for width of post cap and in design except for connectors and post cap . . . offers a truly flush design with any Weldwood Partition Panel. It is of course a completely modular system—all door and panel units of a similar size are completely interchangeable without disturbing adjacent panels.



REMOVABLE POST CAP
3-WAY LOCKING PLATE PART #5
CHANNEL PART #1
POST LOCK CONNECTOR PART #2A
CHANNEL PART #1
SPRING CLIP PART #3

DESIGN 102 WITH ⅞" RECESSED ALUMINUM POST CAP

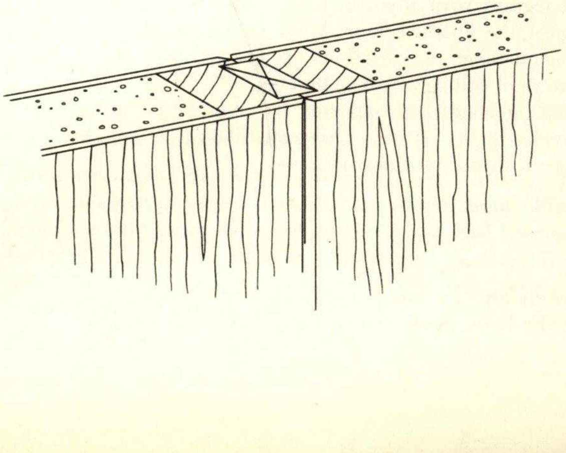
Provides a very effective custom-look installation at standard price. With the vertical shadow-line of the recessed aluminum post strip and recessed base and recessed head, Design 102-connected panels appear to be set forward from the wall in very attractive manner. All Weldwood Partition Panels can be used with Design 102 and are of course interchangeable. Panels, post strips and all component parts are completely salvageable.



REMOVABLE POST CAP
CHANNEL PART #1
POST LOCK CONNECTOR PART #2A
CHANNEL PART #1
SPRING CLIP PART #3

DESIGN 103 SPLINE, "V" JOINT

Where a choice partition panel is demanded—but where *complete* flexibility of floor division is not a prime requisite—Weldwood panels connected by Design 103 is a logical selection. The panels are connected by wood or metal splines—erection being progressive to require minimum connector parts.



Weldwood Movable Partitions

(sold and erected by Weldwood Partition Manufacturing Distributors)

SUGGESTED SPECIFICATIONS

FLUSH MOVABLE PARTITIONS

Note: Design engineering facilities are available to aid in the development and planning of additional details from this basic system.

A SCOPE

Furnish and install complete the Weldwood Movable Partitions as hereinafter specified and indicated on the plans.

Partitions of other manufacturers which are proposed as generally meeting these specifications may be submitted for approval, stating the exceptions from these specifications and the difference in price effected by their use.

B GENERAL CONDITIONS

The General Conditions are hereby made a part of this Specification. This sub-contractor shall assume all obligations therein that affect his work.

C SHOP DRAWINGS

Submit in duplicate drawings showing details of construction, partition layout, typical elevations, hardware schedule, finish and any special conditions not covered by typical details. Shop drawings must be approved before fabrication and assembly of material.

D GENERAL REQUIREMENTS

1. Standard Heights—The partitions shall be 1¾″ thick and in standard cornice (7′1″) or ceiling heights as shown on the drawings. Top fillers shall be variable in height (as required). Glazed railing or low railing partitions shall match the standard high partitions as shown on the drawings (as required).

2. Interchangeability—The partitions shall be in modular units from 1′0″ to 6′0″ in width in 2″ multiples. Door units shall be interchangeable with panel units of the same size. Units shall be designed to allow for rapid 2, 3 and 4-way additions in the future substantially without removing existing units.

3. Erection—Partitions shall be erected in a rigid and substantial manner, straight, plumb and true with horizontal lines level. The component units shall not swell, shrink, warp, crack or open up. Units shall be interlocked and aligned at all panel and door unit joints. In essence the partition shall be flush; however, all panel edges shall be slightly beveled by breaking the edges and a slight V joint formed with adjacent parts. Partitions shall be installed on top of the finished floor. Floor fastenings shall be concealed and adjustable to variations in floor levels. Reinforcement to the rigid ceiling or other bracing shall be provided on runs over 16′ in length unsupported by cross runs, or as required to provide rigidity. Hung ceilings shall be rigid enough to withstand lateral thrust on the partitions.

Note requirements here for any partitions to have *maximum soundproofing*—sealed base and head and rockwool packed posts, base and head.

4. Electrical Provision—Provision shall be made for wiring and outlet space in the base, posts and in the cornice. Cutouts for outlets, etc., shown on the drawings shall be provided by this sub-contractor. All electrical parts and work shall be by others.

5. Hardware—Door hardware shall be provided as specified on the Hardware Schedule, and installed neatly and accurately. (If required) Door closers shall be concealed overhead type. Doors shall be hung on 1½ pair 4″ x 4″ ball-bearing butts. Louvres shall be provided for doors as shown in the drawings (if required).

E MATERIALS

1. Panels—Shall be Weldwood Partition Panels with WELD-ROK core as manufactured by the United States Plywood Corporation. The thickness shall be 1¾″ full. The face veneer shall be (Specify species required or paint grade, if partition to be painted). The long edges of the panel shall be grooved and a .040 steel channel applied to each edge.

2. Panel Connections—Shall be provided by means of positive metal connectors. Vertical wiring space shall be provided through the metal connectors. The flush post covers of matching Weldwood plywood shall be attached by snap-on spring clips.

3. Doors & Frames—Doors shall be 1¾″ Weldwood "Stay-Strate" Doors. The doors shall be hung with clearance at jambs and heads. The door frames shall be made of wood matching the panels as shown on the drawings. Aluminum (brass) stops shall be provided.

4. Gates—(if required) Shall be provided where shown on the drawings and shall be of same construction as Partition Panels.

5. Glass and Glazing—(if required) Shall be provided of design, quality and thickness shown on the drawings.

6. Base—The base shall be 5″ high and run continuously on both sides of the partition. It shall be removable from either side to allow access to lay-in wiring. The base material shall be ⅛″ satin black Micarta (alternate: ⅜″ wood matching the partition).

7. Cornice—Shall have a ⅜″ projection and run continuously on top of all units. The material shall be wood matching the partition and joints shall be staggered on the two sides. The internal cornice shall also run continuously and provide a wiring space accessible at the posts. Ceiling high partitions shall utilize the standard aluminum ceiling channel as detailed.

8. Top Filler—(if required) Shall be Weldwood Partition Panels that extend to the ceiling and match the material of the partition units. The top filler shall be an integral part of the unit.

Alternate—Double sheetrock top fillers shall be applied to studs on 24″ centers. Joints shall be taped to make joints invisible. Finishing shall be done to match ceiling by painting contractor.

9. End Fillers—Shall be flush and made of ⅜″ matching Weldwood plywood both sides.

10. Finish—Hardwood faces of panels and all exposed wood parts shall be stained or filled depending on the wood, lightly steel wooled and then two coats of a water-white satin lacquer applied, lightly steel wooled between coats (or specify finish required).

weldwood

ACOUSTICAL MOVABLE PARTITIONS

for sound control and privacy • guaranteed to perform as claimed • hardwood faced • 1¾"-thick

• 34 db installation average rating by National Bureau of Standards actual tests

To satisfy the growing desire among architects and owners for privacy and quiet in all kinds of buildings, United States Plywood Corporation has developed this very effective, economical acoustical movable partition . . . average rated at 34 db sound transmission loss at eleven levels over the 125 to 4000 cps sound intensity range. With its connecting posts and installation components and Weldwood Acoustical Doors, it is a completely integrated system.

These hardwood-faced soundproof partition panels show no difference in outward appearance from hardwood-faced standard Weldwood Partition Panels and Doors of the same species. They can be readily combined, using the same connection system.

MOVABILITY The connectors are Weldwood's exclusive metal key design, and offer the same freedom of floor layout and future redesign.

DECORATIVE FACES Any of the full line of Algoma-Made hardwoods, prefinished or unfinished, or custom finished to specification.

PANEL CONSTRUCTION Hardwood veneered ⅛", 3-ply skin over sturdy, stable Novoply core, with acoustical damping and separation within the panel. 1⅜" stiles and rails.

PANEL THICKNESS—1¾" standard.

PANEL SIZES—up to 5/0 x 10/0.

PANEL WEIGHT—6 lb./sq. ft.

CONNECTOR SYSTEMS A modification of Design 101 (see page 9) is recommended, with its 1¾" flush post cap. See details. Modifications of Design 100—with 2¾" flush post cap—and Design 102—with recessed aluminum post cap—may also be detailed where special appearance is desired.

INSTALLATION For variations from the suggested details, consult your Weldwood Movable Partitions Distributor, or your nearby Weldwood Branch Office, or write direct.

WALL STARTER DETAIL

GUARANTEE

Weldwood Acoustical Partition Panels, when properly installed under normal service conditions, are guaranteed for acoustical performance as claimed and against manufacturing defects for the "Life Of The Building". Should any Weldwood Acoustical Partition Panel fail to meet these standards, in an original installation, United States Plywood Corporation will replace said partition panel including erection and finishing without cost to the owner.

HOW TO SPECIFY

In Section E of Weldwood Movable Partition Suggested Specification, see page 10, substitute:

1. Panels—Shall be Weldwood Acoustical Partition Panels with acoustic core, as manufactured by United States Plywood Corporation. The thickness shall be 1¾" full. The face veneer shall be (Specify species required or paint grade if partition is to be painted). The long edges of the panel shall be grooved and a .040" steel channel applied to each edge.

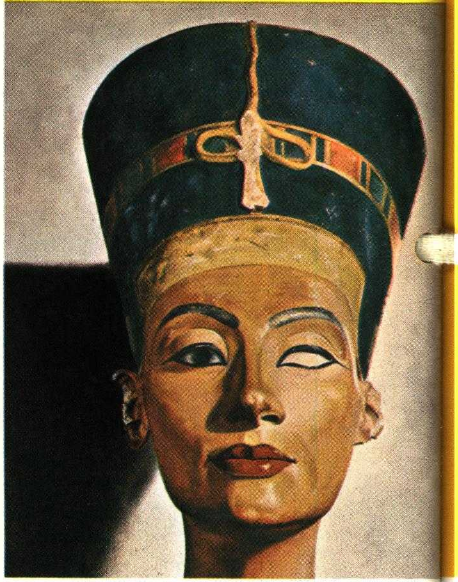
Made Only By

VMP

VIRGINIA METAL PRODUCTS, INC.

Only VMP offers you PERMACOLOR



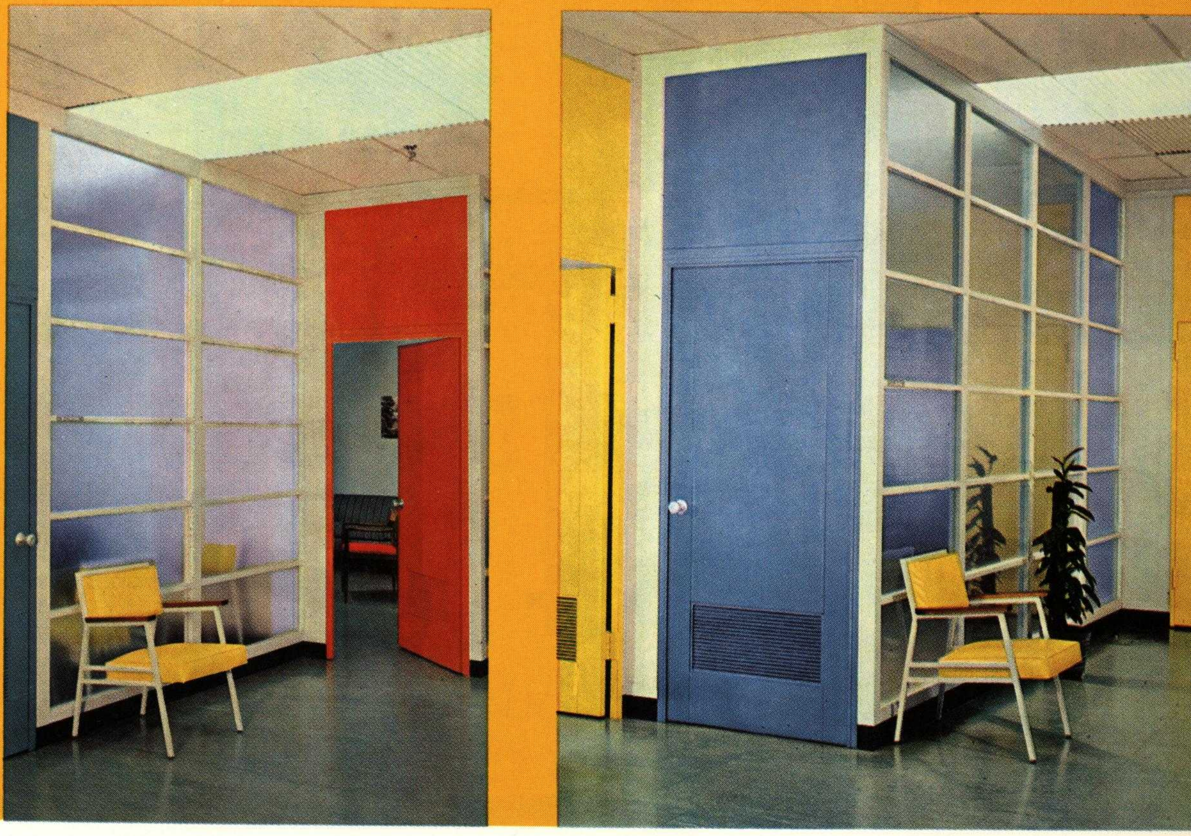
A FINISH THAT DEFIES TIME

Permacolor—far more rugged than the colors that still shine vividly on this head of Queen Nefertiti after some 3300 years. This remarkable new finish for VMP Mobilwalls withstands acid . . . alkali . . . abrasion . . . bleaching light . . . salt spray . . . temperature changes: truly proves its enduring beauty against these enemies of wall texture and color.

Time-defying Permacolor is just one of many reasons 19 of 20 largest U. S. corporations are owners of recent VMP Mobilwall installations . . . why three of 1958's six "Office of the Year" award winners used VMP movable partitions.

WITH THESE OTHER CUSTOMER BENEFITS

- Panel faces of patent leveled furniture steel—U. S. Standard gauges.
- Rigid and rugged construction with the appearance of permanency.
- Accessories quickly available for fast additions or replacements.
- Interchangeable parts assure maximum flexibility as well as low stock inventory requirements.
- The most convenient wiring facilities in the entire modular construction field.
- Sound adapted.
- Virtually zero maintenance.
- Rolled shapes to insure precision of fit of mating parts.
- Field installation by factory trained VMP crews.
- Life-time service for every VMP Mobilwall installation.
- VMP offices or representatives in every major U. S. city.
- Continuous "open-stock" supply of fully interchangeable units.



VMP Mobilwalls, based on the horizontal lines of the Japanese Shoji Screen, reflect the international activities of Dorr-Oliver Incorporated, Stamford, Conn.

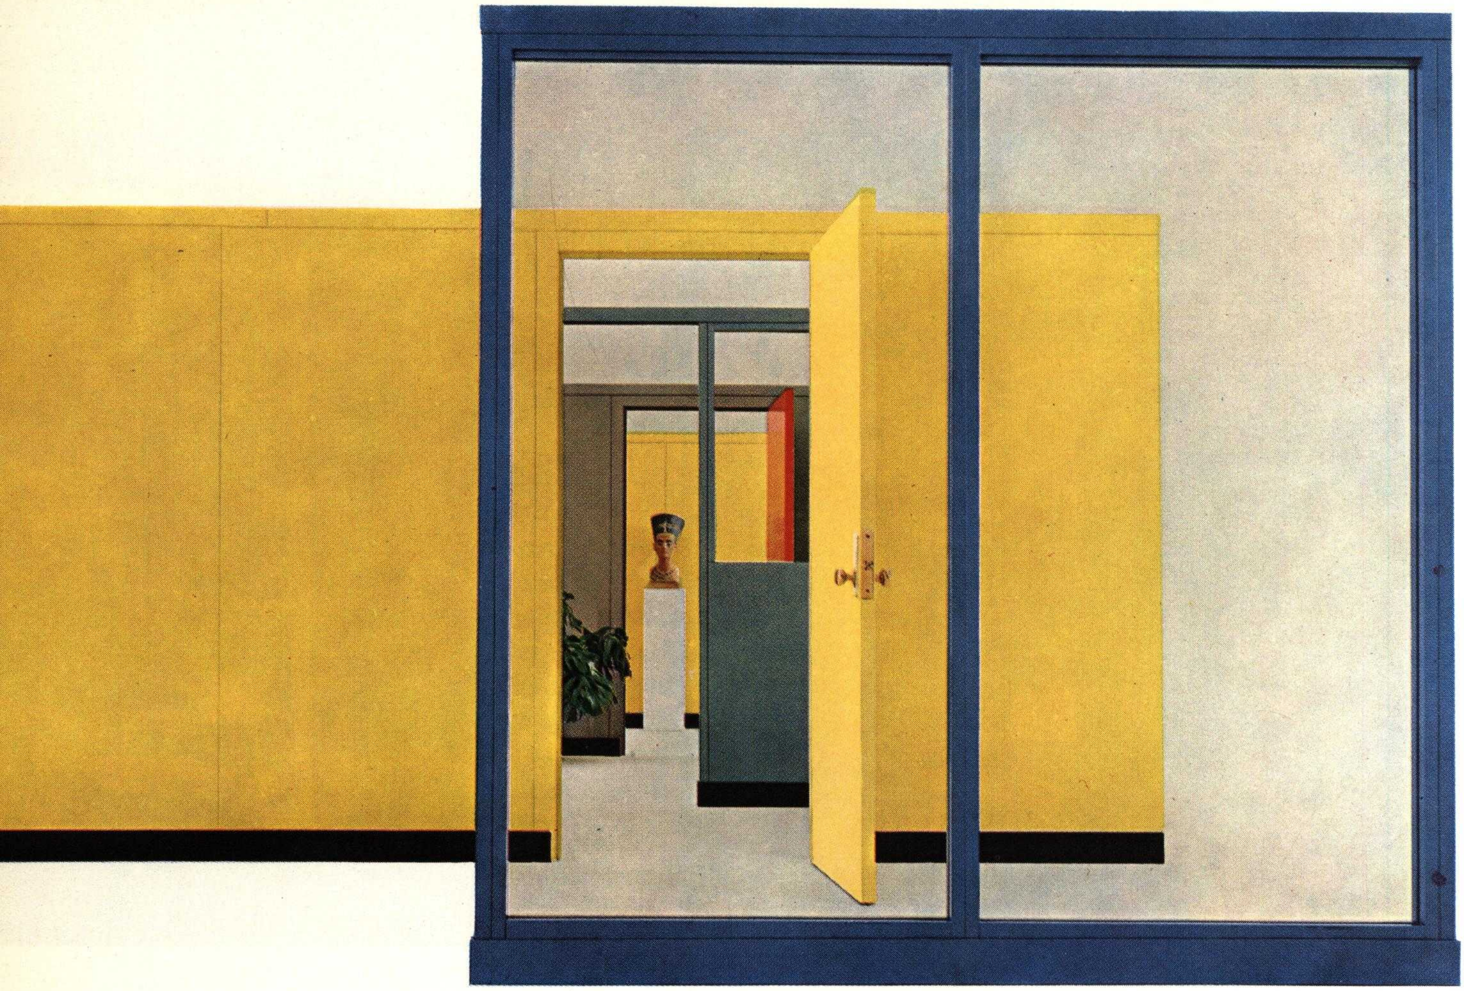
Only VMP offers you . . .

FURAMIC STYLING

. . . A COORDINATED DESIGNING, ENGINEERING AND PRODUCTION SERVICE OFFERED TO YOU ONLY BY VMP

Furamic Styling lets you specify color, arrangement and accessories to fulfill *your* concept and carry out *your* original ideas. Thanks to this creative collaboration between you and VMP, you can create dramatic new interiors to reflect a corporate image . . . give your clients completely individualized interiors at far less than the usual cost of custom styling.

As a starting point, consider the basic VMP partition systems described briefly on the following pages. Then call on VMP design engineers to work with you. (Contact your nearest VMP representative listed on the back cover of this booklet. Or call VMP's Marketing Vice President, Delevan H. Stearns, at 2651 in Orange, Virginia.) Furamic Styling is at your command . . . to develop custom-styled Permacolor Mobilwalls in any price range, from the most economical to the most luxurious.

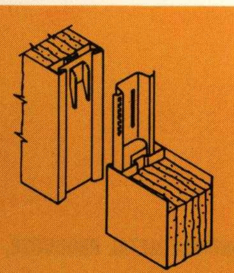


For matchless flexibility at a fraction of former cost...

accent
MONOLINE MOBILWALLS

This single-line partition system combines the smartness of a modern, fully-flush partition with a subtle accent line between panels . . . the rearrangement ease of engineering simplicity unique in the partition field . . . and the thrift of a first and last cost far lower than that of any comparable product.

Secret of Accent Monoline's complete flexibility is an important advance pioneered by VMP engineers, an exclusive new spring spline on which patents are pending. Panels can be changed or replaced from any point of partition run, without jackknifing adjoining panels or disturbing top filler. Thus a single 3″ panel can be changed or a door installed in just five minutes!



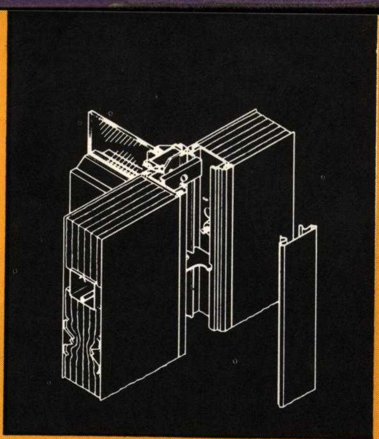
Splines are integral with panel assembly. Four-point panel interlock assures maximum tightness of joint. Heights and widths to fit your job requirements.

RF Installation, Baptist Foreign
Mission Board, Richmond, Virginia

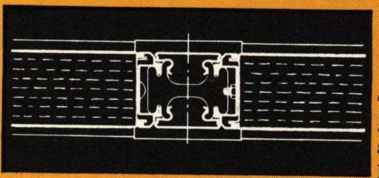
Royal Flush and Semi Flush Mobilwalls have proved their versatility and lasting beauty in offices, schools and hospitals throughout America. With RF, the truly flush, non-recessed panels are 3″ thick, available in all-steel or steel-and-glass combinations. Matching railing and wainscot provide a complete RF interior.

At a somewhat lower cost and with greater versatility, consider VMP type SF, a companion Mobilwall to type RF. SF panels are 2¾ inches thick—similar in construction to RF except that panel surfaces are recessed into the post member, this gives a ⅛ inch offset with posts and post covers. Especially adaptable for rapidly changing needs, as panel readily reduces in width.

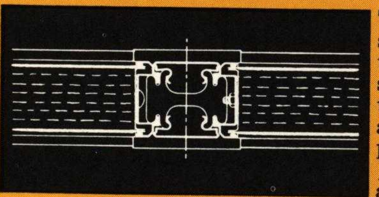
Both RF and SF Mobilwalls feature VMP's famous universal post which accommodates two, three or four-way intersections. Since extension requires no removal or dismantling of adjoining partitions, subdivision or revision of space is fast and economical. Other benefits include: telescopic glazing; four point contact link plates; snap-on mouldings at cornice, post and base. Wide variety of widths, heights and panel arrangements.



VMP's universal post shape offers many advantages. There is no need to remove or dismantle adjoining partition units, should extension be necessary. The simple removal of the post cover permits the attachment of an additional unit with the use of the self-aligning link plate members. Result: Faster subdivision or revision of office space.

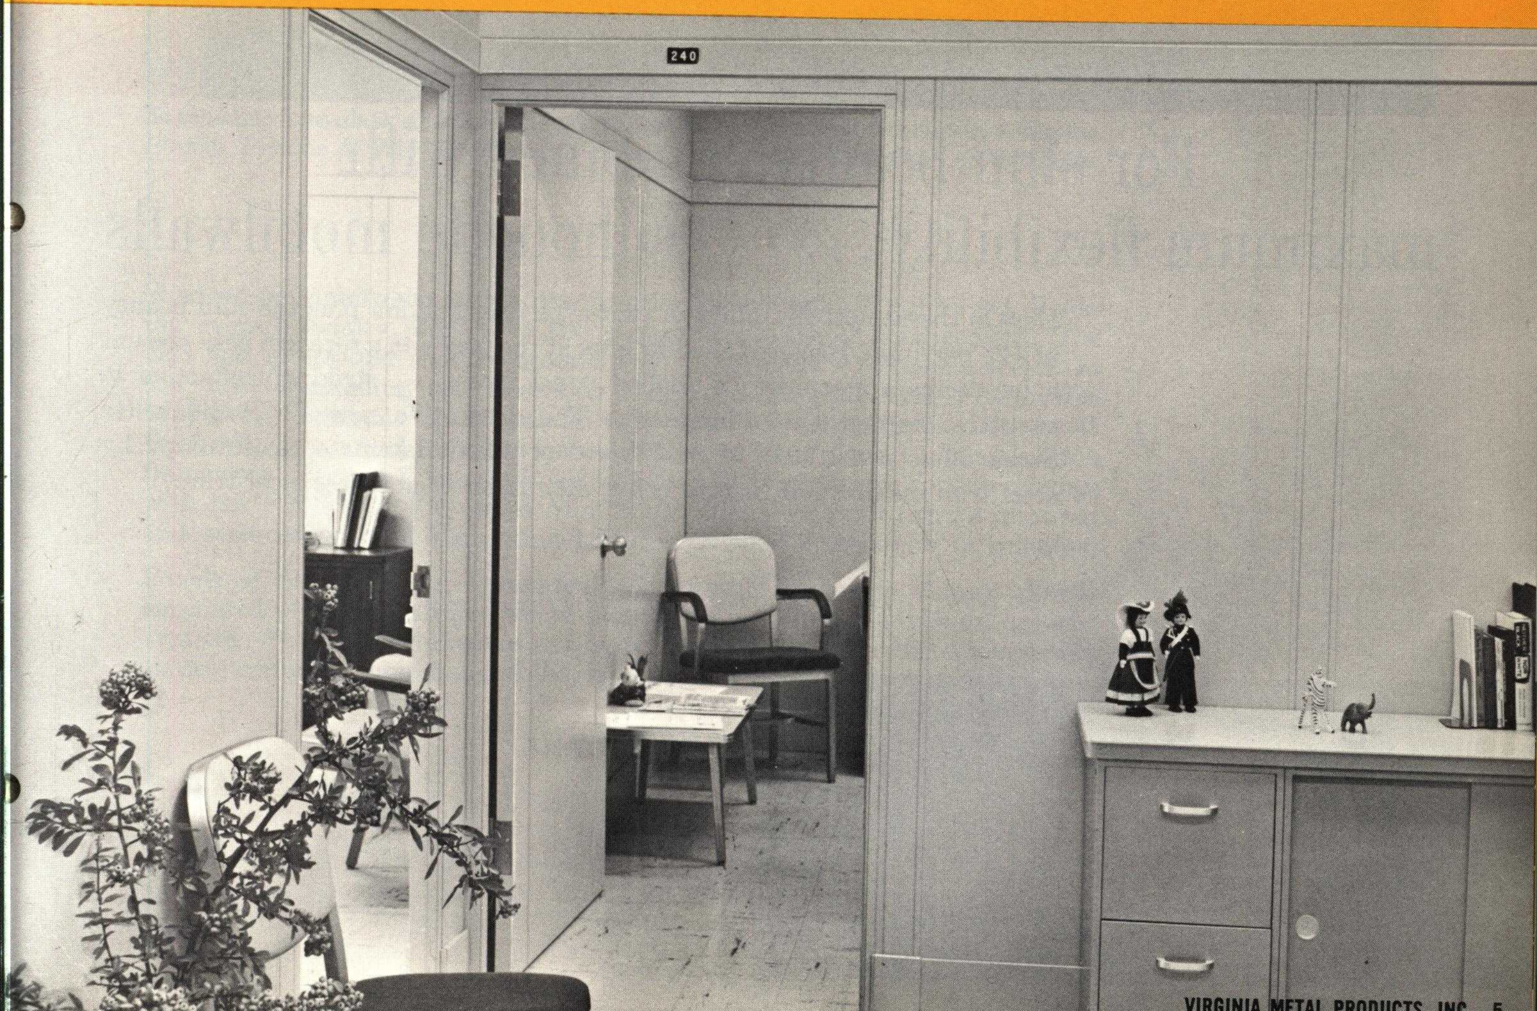


These two profiles illustrate the basic difference between VMP RF and SF partitions. The RF partition shown at left is 3″ thick. Panels are flush with post and pilaster members.

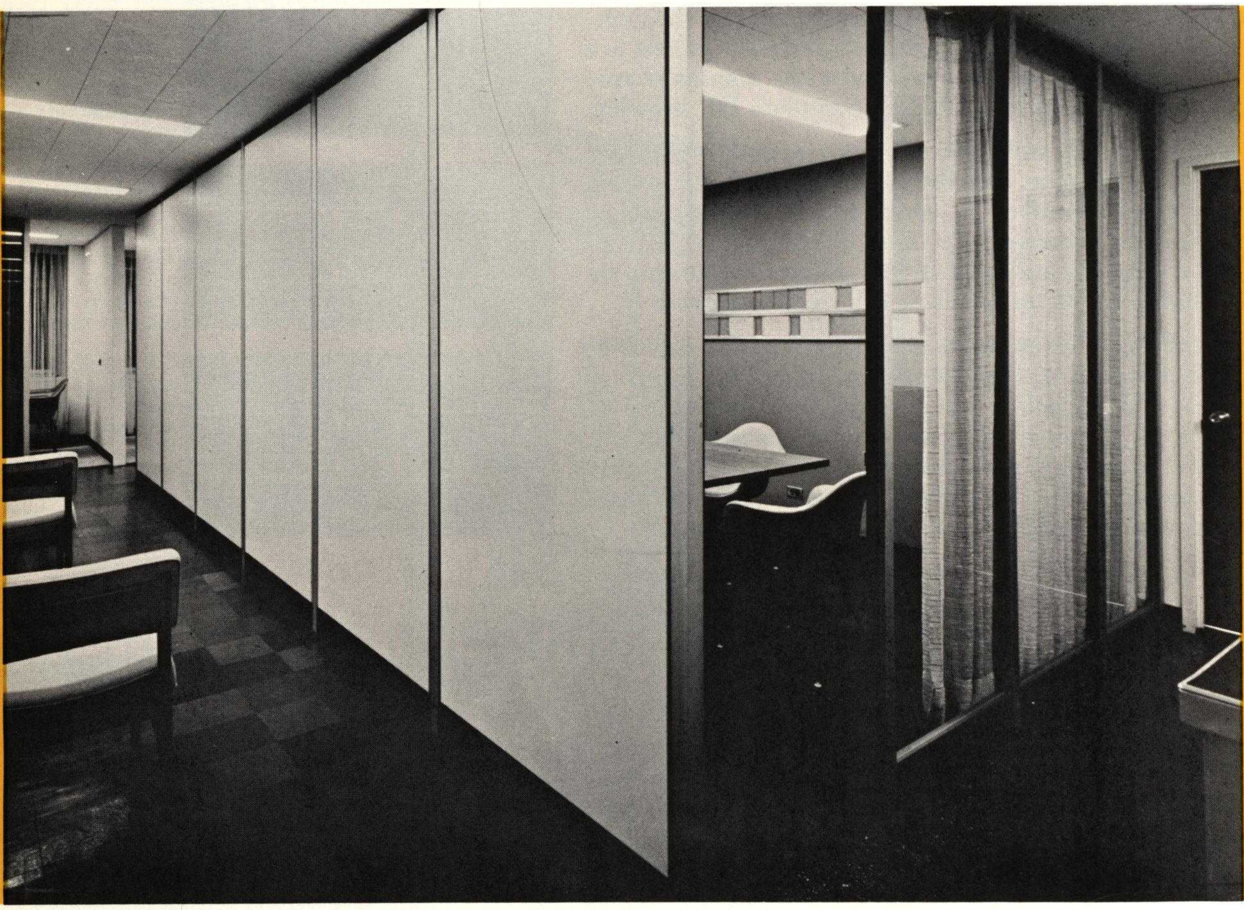


The SF partition, shown at left, is 2¾″ thick. Construction is similar to RF except that the panel surfaces are recessed into the post member, giving a ⅛″ offset with posts and post covers.

For dignity and simplicity in style ... RF or SF mobilwalls

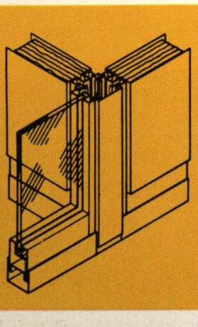


Modern Silhouette Mobilwalls grace the Executive Offices of Cushman and Wakefield, 529 Fifth Avenue, New York City. Photograph by Felix Gilbert.



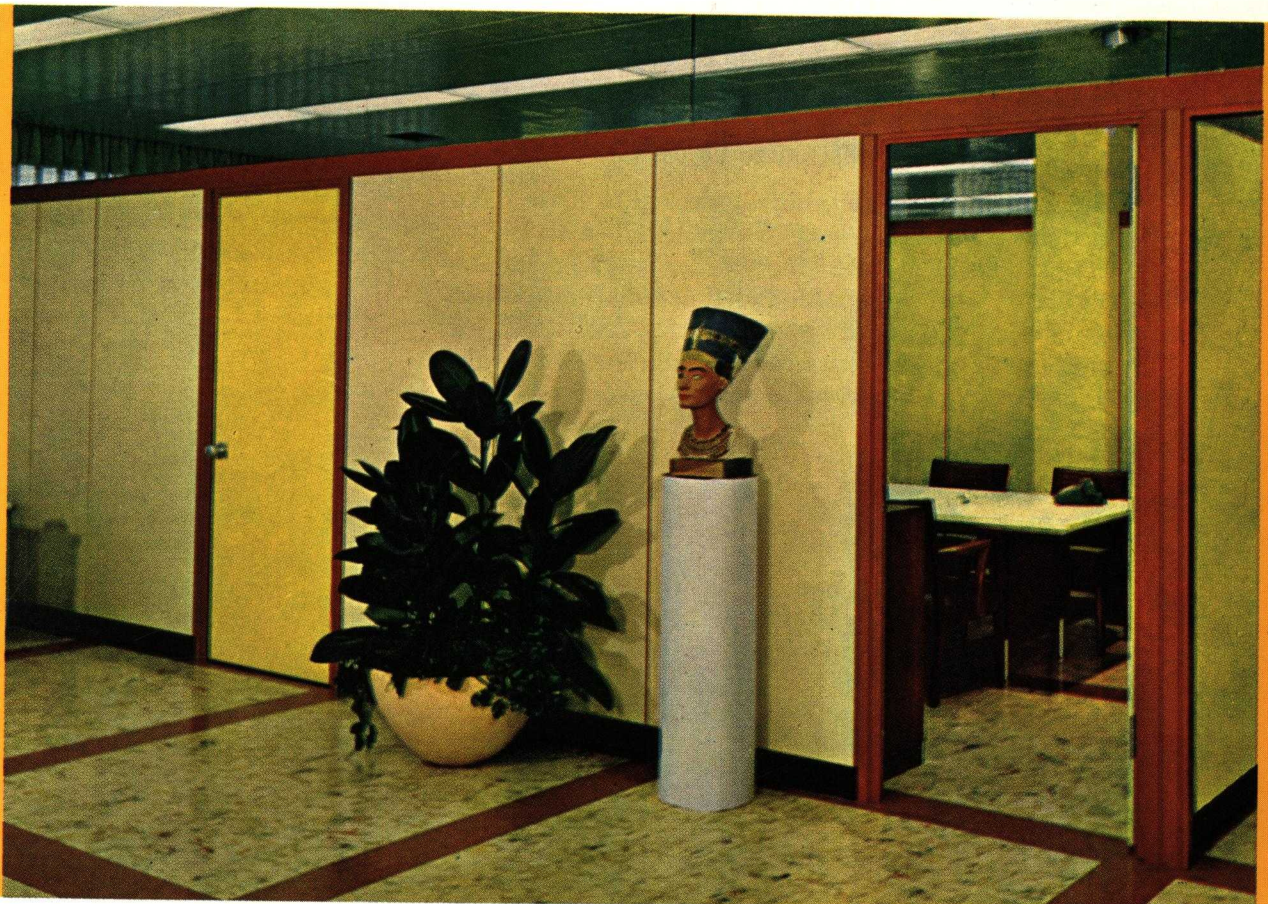
For slim beauty combined with maximum flexibility . . . SL silhouette mobilwalls

Here is the utmost flexibility of unit-type construction plus the slim beauty of a 2″ partition. Recessed shadow lines at the post and a recessed base present a handsome appearance of applied panel faces . . . strikingly effective in executive and general office areas. The decorative new VMP Silhouette Series offers panel faces of steel, wood or plastic laminate, accentuated by steel trim members of neutral color, aluminum or stainless steel trim.



Silhouette's universal post allows two, three, or four-way intersections for faster revision of office space. Positive link-plate system assures rigidity.

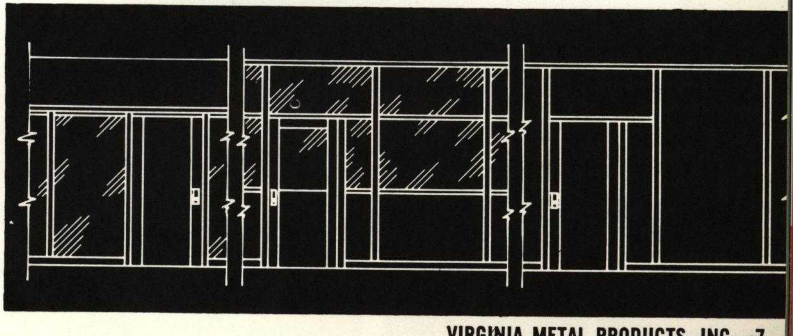
For maximum flexibility of unit type construction... FG shadowline mobilwalls

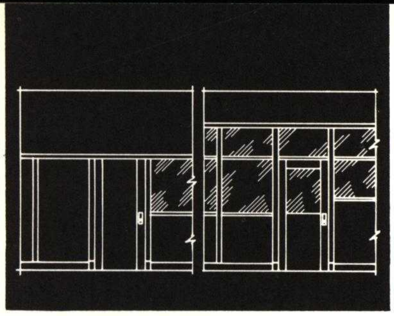


Shadowline Installation, International Minerals and Chemical Corporation, Skokie, Illinois. Perkins & Will—Architects. Turner Construction Company—Contractor.

Shadowline Mobilwalls open a new frontier for modern office interiors. Striking modern beauty joins with the utmost flexibility of arrangement. The deft and interesting shadow around each panel adds a dramatic accent to the most demanding and luxurious areas of a building. And Shadowline Mobilwalls represent an ultimate in unit-type versatility. Panel units are 3″ thick with two sound insulated removable panel faces mounted on a skeleton framework. Because framework is 2⅜″ thick, it is adaptable for interchange with the FP, FF or FM series Mobilwalls. Either or both can be removed and replaced without disturbing adjacent panels. Redecorate in minutes!

Panels of plastic fabric, laminated wood veneer, plywood veneer, plastic laminated plywood, fabric covered tackboards and steel chalkboard are also available for endless variations in textural interest. Positive link-plate action assures complete interchangeability and rigidity.





An attractive and easily maintained wall with flush panels, FP Mobilwall offers many of the features of FF Mobilwalls, but has fewer parts. This means substantial savings on installation and upkeep.

FP is particularly suitable for clerical or filing rooms and other functional areas. FP interlocks with FF and FM Mobilwall styles at the post, providing maximum flexibility when various kinds of functional areas adjoin. Panels are of steel or steel and glass, 2⅜″ thick, set flush with posts. Rock wool insulation. Concealed wireways, continuous strike around floating door jamb is steel instead of rubber.

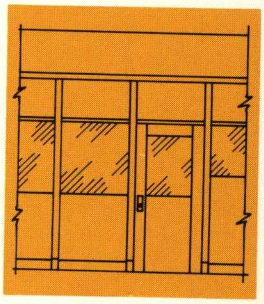
For greatest economy... FP mobilwalls

Below—a striking example of Furamic Styling in Permacolor... VMP Mobilwalls patterned along the lines of the Japanese shoji screen for Dorr-Oliver's new headquarters building in Stamford, Connecticut. Designed to reflect the worldwide activities of this international engineering firm.

nterior Design—Rodgers Associates, New York. Architect—Sherwood, Mills and Smith, Stamford. Contractor—Deluca Construction Co., Stamford.

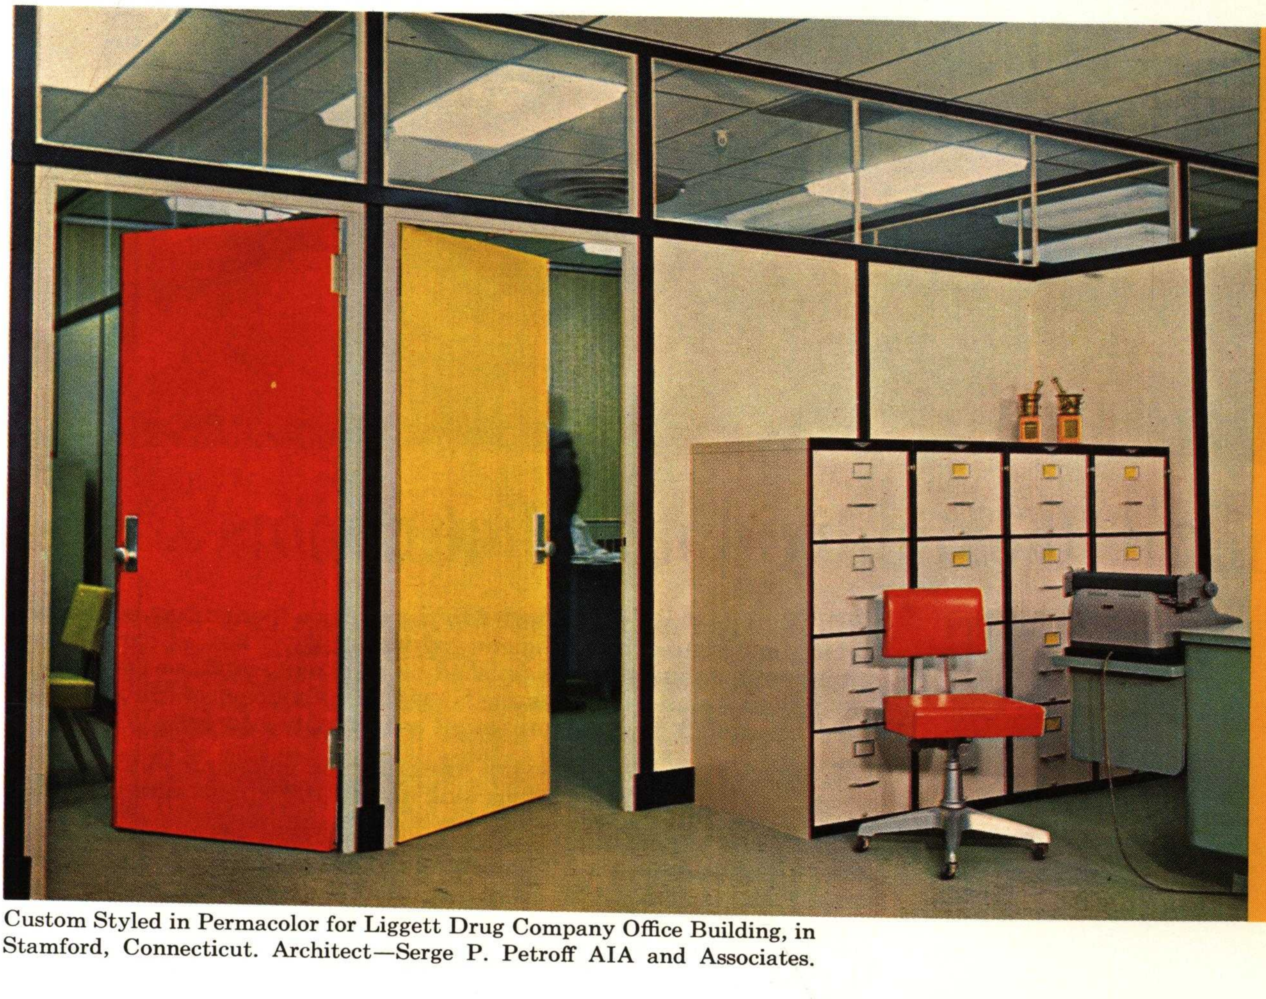
For smart appearance at moderate cost...FF mobilwalls

Available in a wide variety of widths or heights in steel or steel and glass combinations, FF panels are 2⅜" thick, steel, rock wool insulated, have continuous wireways and adjustable door jamb with continuous rubber strike.



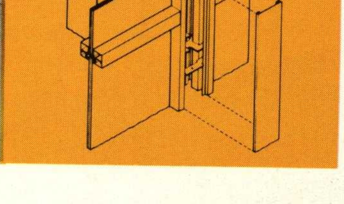
Thanks to extreme standardization of components, FF Fully Flush Mobilwalls lead the modular partition field in offering good looks at a very favorable cost. FF Mobilwalls provide a smooth, fully flush wall suitable for executive or general offices, conference or reception rooms.

A valuable FF plus feature—exclusive in the industry—is the ability to join directly and interlock with FM and FP Mobilwalls. Thus some areas may be partitioned with flush type FF while storage or other adjacent areas are partitioned with FM— a paneled, low-cost partition type—for even greater savings. (See below)

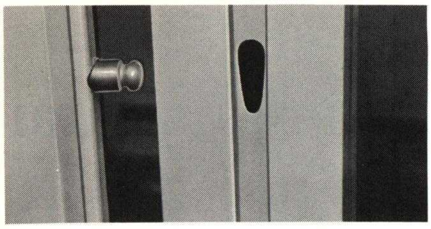


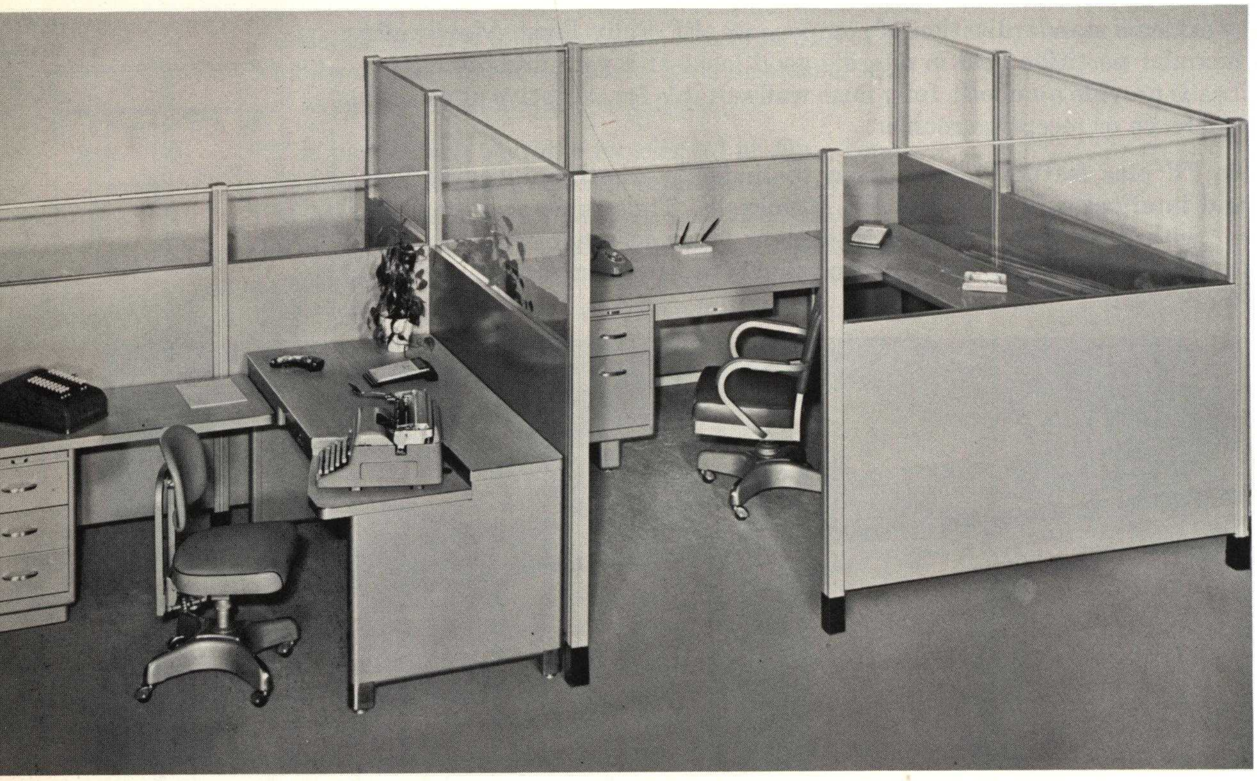
Custom Styled in Permacolor for Liggett Drug Company Office Building, in Stamford, Connecticut. Architect—Serge P. Petroff AIA and Associates.

For Adjacent Areas . . . FM Mobilwalls. This paneled partition interlocks completely with type FP and FF—a VMP exclusive. Plus features include: 2⅜" thick posts; ⅜" thick packed steel panel; concealed wireways in base, posts and cornice; positive link-plate action for assured rigidity; continuous rubber strike on floating door frames; moderate sound-proofing properties. Matching Mobilscreen and Mobilrail available.



Panel Locks Into Post. Tongue and groove construction of panel and post plus two steel locking studs insures a tight and positive connection of the panel to the post. No tools are required to link the panels together.





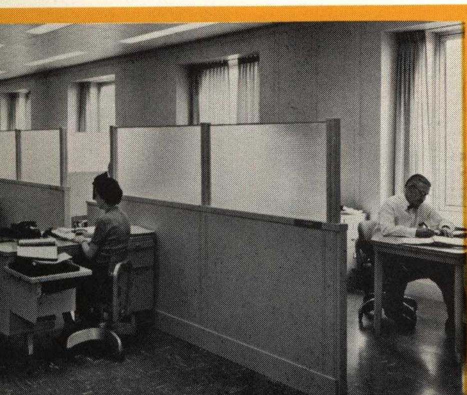
Mobilwall Jr.

for individual office rooms…and…

With VMP 2⅜″ thick full-flush Mobilwall Jr., a moderately priced conversion of large office area into efficient individual work spaces can be made with minimum of confusion. The finished office places emphasis on the economical and easy to install—do-it-yourself engineering concept of Mobilwall Jr., which can be installed by any competent maintenance force.

This advantage eliminates the necessity of engaging outside installation crews. Its clean-cut harmonious look and sturdy appearance make Mobilwall Jr. a most popular choice in flexible office planning.

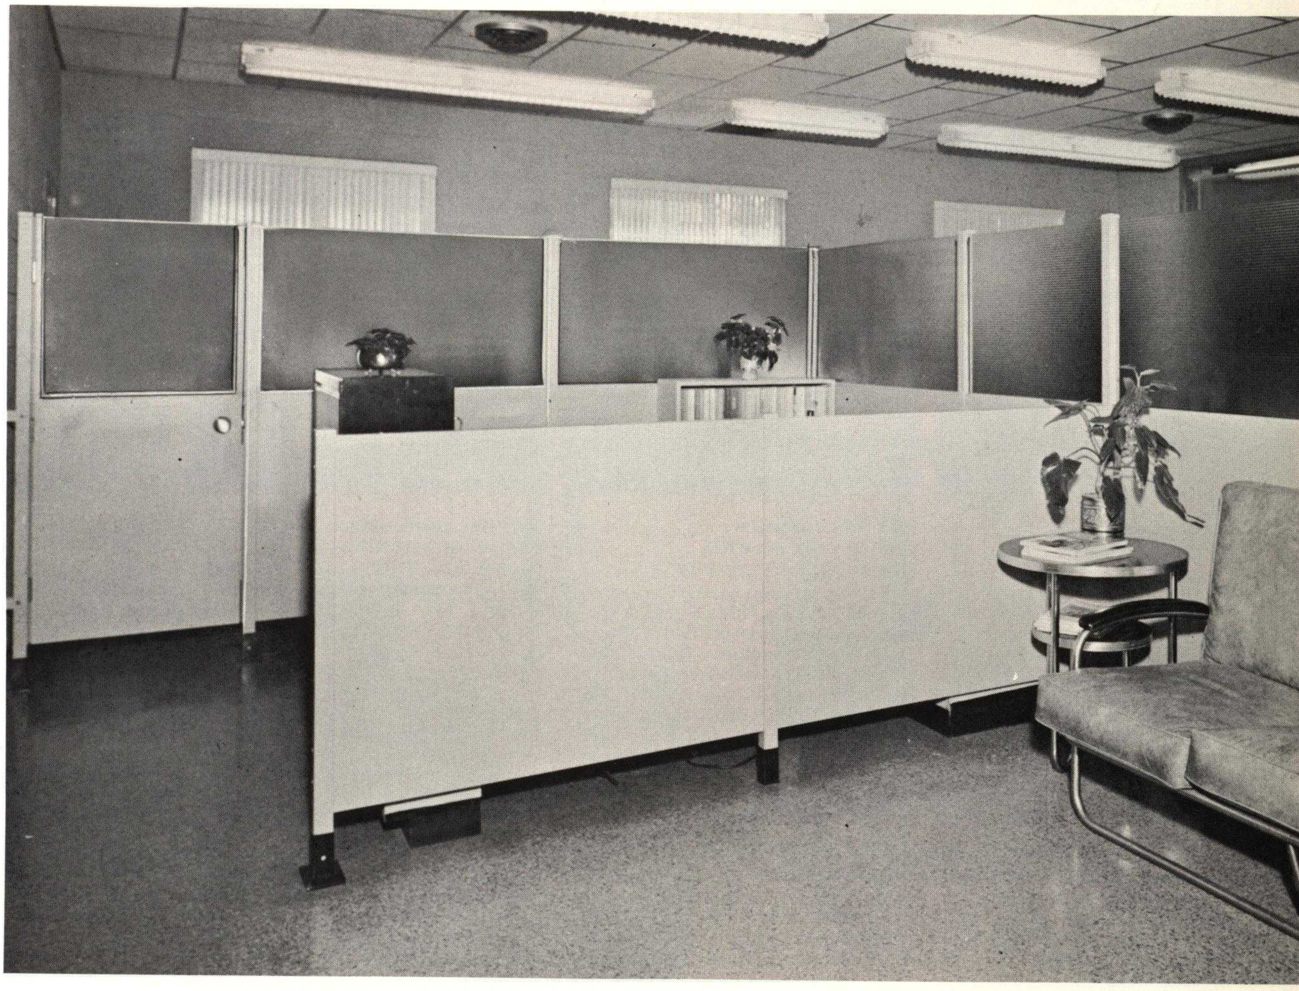
Available in heights of 42″, 54″ and 66″ steel or steel and glass combinations. Panel widths from 12 to 68 inches in 6 inch increments. Parts are interchangeable for multiple use, and one universal post meets all standard partition conditions whether 2-way, 3-way or 4-way extensions are required. Mobilwall Jr. is the same unit thickness as Mobilwall Type FP and FF.



For "low elevation" space sub-division—**RF** & **SF** mobilscreen

Mobilscreen is an eye-level high partition, suitable for use with general lighting and ventilating arrangements. 42″ rail height with 12″ or 24″ of glass above. Mobilrail is designed to match and join Mobilscreen. Offered in 36″, 42″ and 54″ rail heights. Single and double acting gates may be located wherever they are needed.

Metlwal Jr. installation, B & G Olson Company, Inc., Mechanical Contractors, Richmond, Virginia.



Metlwal Jr.

for large area sub-division mobilwall Jr. and metlwal Jr.—

Metlwal Jr., 1¾″ thick, is the *most* economical steel divider wall available and leads the field in simple, inexpensive space control. Like Mobilwall Jr., Metlwal Jr. makes it possible to segregate or sectionalize large areas or rooms on a do-it-yourself basis. As time and motion studies have repeatedly proved . . . this leads to a higher order of business efficiency. Use Metlwal Jr. to divide space—create privacy—regulate traffic—improve efficiency. You can create any office layout without interfering with existing lighting and air conditioning. *And*, your business need not be interrupted during installation. Tailored with many of the details of our full-flush 2⅜″ thick Mobilwall Jr., this thin-trimly designed room divider adequately copes with a majority of office re-arrangement problems.

Available in heights of 42″, 54″ and 66″ steel or steel and glass combinations. Parts are interchangeable for multiple uses and one universal post meets all standard conditions whether 2-way, 3-way or 4-way extensions are required.

For partial partitioning—**RF** & **SF** mobilrail

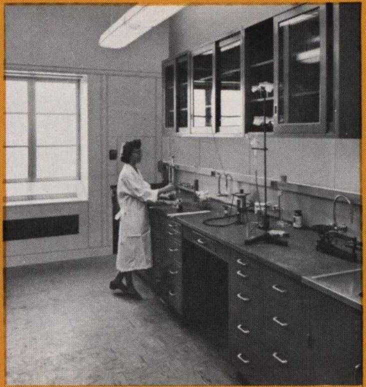
VMP offers the widest variety of glazed and low railings in the industry . . . two flush types, one semi-flush type and two paneled types. Mobilrails are used throughout the country to define work areas, create semi-private offices, control traffic, enclose information desks and reception areas. A proven way to increase work efficiency.

For every specific partition need...

for factories . . .

B-W-WB MOBILWALL

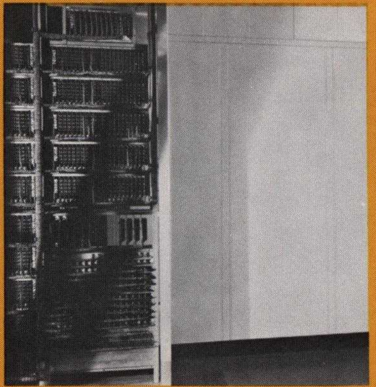
VMP industrial type B, W and WB Mobilwalls are designed for factory space-division. The interchangeable panels are erected between posts vertically for heights up to thirty feet. All-steel, or steel-and-glass is available in these strong, attractive partition types. Glass, single steel or insulated steel panels are completely interchangeable. VMP industrial partitions have a post cover on each side of the post making it possible to take down panels from either side and making wiring accessible from both sides. (Type B only has an independent floating base, removable for wiring.) Type W has narrow muntin spacing; B and WB have wide muntin spacing.



for laboratories . . .

LW MOBIL-LAB-WALL

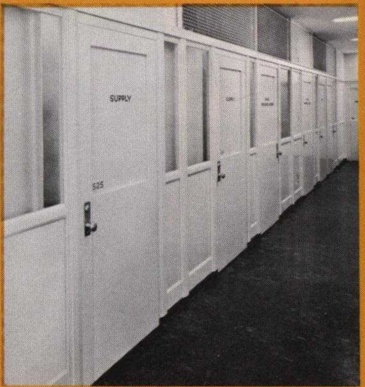
VMP Mobil-Lab-Wall is an exclusive partition, designed for use in laboratories. This 6″ thick partition makes it possible to internally house mechanical and electrical services with service outlets to either wall surface. VMP Mobil-Lab-Walls feature movability, extreme strength and fire resistance. Explosion hazards are reduced since the panels will not disintegrate into fragments. Mobil-Lab-Walls are available in ceiling high, cornice high, or of peninsular or island type application. All units are interchangeable and are adaptable for junction with other standard VMP Mobilwalls, exterior wall wainscot and conventional walls.



for fire protection . . .

FW MOBIL-FIRE-WALL

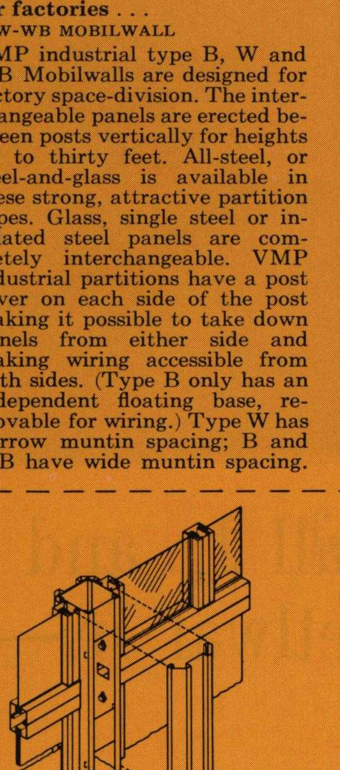
VMP type FW Mobil-Fire-Wall is a handsome, exceptionally strong 3¾″ thick adaptation of type RF. VMP Mobil-Fire-Walls have been approved by Underwriters' Laboratories, Inc. to meet all requirements of the Underwriters and A. S. T. M. one-hour temperature and hose stream fire test. Protects personnel, valuable records and equipment, and reduces fire insurance premiums. Applications include public buildings, schools, hospitals, laboratories, communication companies, and factories. Mobil-Fire-Wall need only be used where fire control is actually required, and all adjoining partitions on either side can be any of the VMP standard Mobilwalls.

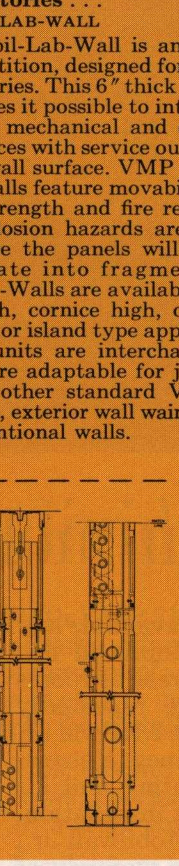


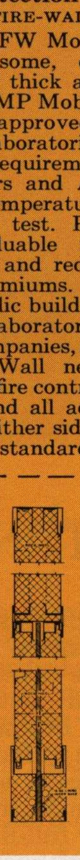
for moulded panel design . . .

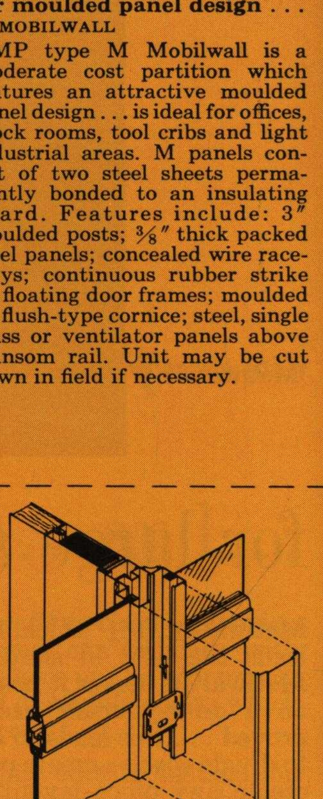
M MOBILWALL

VMP type M Mobilwall is a moderate cost partition which features an attractive moulded panel design . . . is ideal for offices, stock rooms, tool cribs and light industrial areas. M panels consist of two steel sheets permanently bonded to an insulating board. Features include: 3″ moulded posts; ⅜″ thick packed steel panels; concealed wire raceways; continuous rubber strike on floating door frames; moulded or flush-type cornice; steel, single glass or ventilator panels above transom rail. Unit may be cut down in field if necessary.



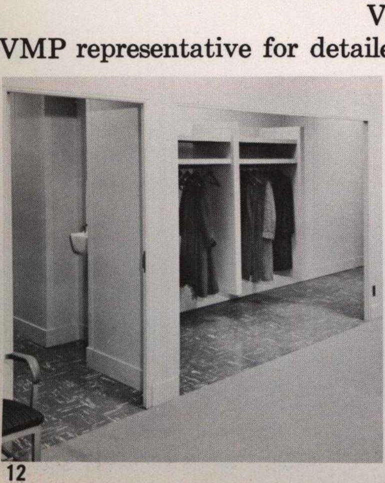


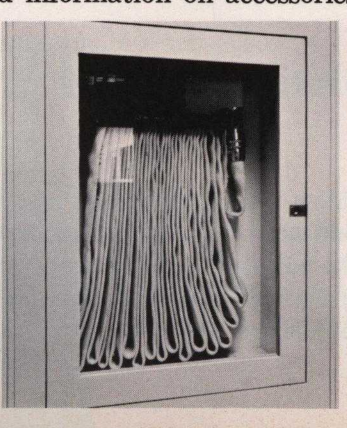


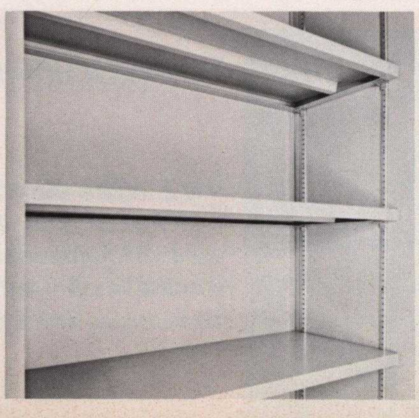


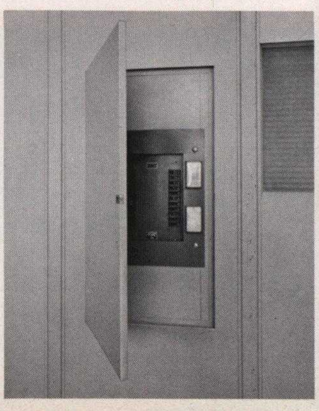
For accessories...

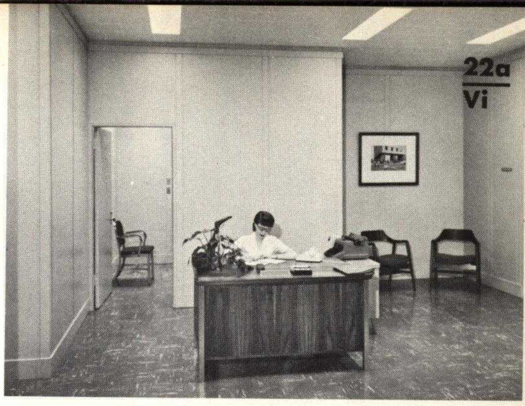
VMP offers the most complete line of accessories available in the industry. Ask your VMP representative for detailed information on accessories and special items for every VMP partitioning system.











Mobilwalls can soon pay for themselves by creating a happier working climate and increasing employee output.

VMP Mobilwalls are designed for "livability" as well as beauty and dependability.

VMP Mobilwalls adapt easily to the best principles of good design and sound organizational planning.

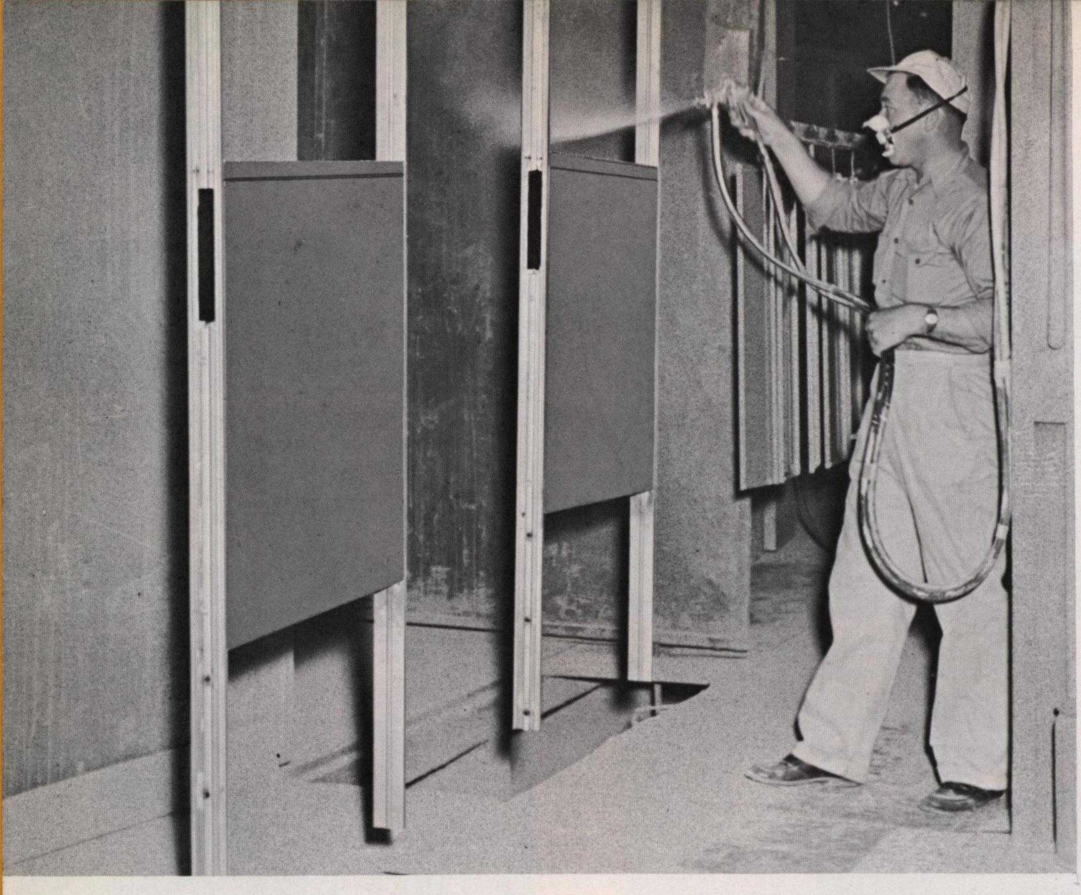
Prompt installation by trained VMP crews eliminates installation problems completely.

For today...

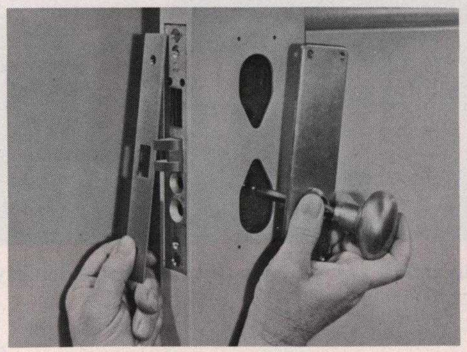
VMP Mobilwall interiors are designed as much for "livability" as for beauty and dependability . . . endlessly versatile in the creative and efficient use of space for all types of buildings. VMP Mobilwalls adapt easily to the best principles of good design and sound management planning. They can shut out glare . . . simplify organizational systems . . . eliminate noisy distractions . . . channel traffic . . . insure privacy . . . contribute to fire safety.

Mobilwalls often more than pay for themselves by creating a happier working climate and increasing employee output.

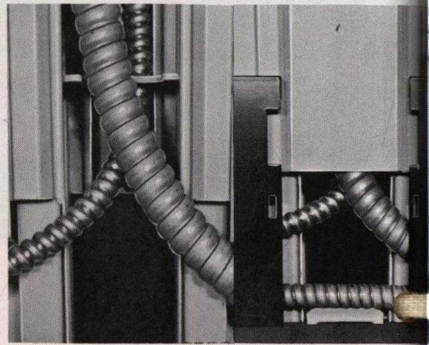
Despite all their plus advantages, Mobilwalls materially reduce construction costs, since their light weight reduces normal building dead loads and superstructure cost. And prompt installation by trained VMP crews eliminates installation problems completely.



Savings in maintenance alone can soon repay the initial installation cost of a VMP Mobilwall interior. Mobilwalls are finished for life—NEVER need repainting. Mobilwalls will not chip, warp, crack or spall. They require no carpentry . . . no plastering . . . no general patching up . . . in fact, practically no maintenance except an occasional soap and water washing to preserve their original lustre.



VMP Mobilwalls have been carefully designed to eliminate or simplify almost every problem of replacement or repair. Such a feature as VMP's unique telescopic glazing member, for instance, speeds glass changes and replacements. Doors in VMP Mobilwall systems feature interchangeable hardware. Electrical fittings, too, are interchangeable.



Mobilwall true lay-in wiring facilities are the most complete and accessible in the industry. Electrical changes are simple "snap-open, snap-on" operations. As for utility repairs and additions, VMP Mobilwalls end costly probing and ripping required with conventional construction. Panels remove quickly for easy access to utilities.

and tomorrow

Not even the most forward-looking architect can foresee a company's future or anticipate every need for office layout changes. And it is then that Mobilwalls truly prove their long-range economy! VMP Mobilwalls are endlessly adaptable and versatile. They can be used time and time again . . changed and rearranged in a matter of hours with a minimum of confusion and expense. There's no tearing down and discarding of costly material . . . no expensive rebuilding . . . and little or no loss of working time. Ask your VMP representative for additional proof that VMP Mobilwalls can meet your every partitioning requirement; both this year and all the years to come.

Concealed ceiling channel of No. 18 gauge steel shall have a continuous groove to receive post extensions. Exposed trim of No. 20 gauge steel, 3" high, shall be removable to provide access to wiring.

K. DOORS AND FRAMES:

Doors of 1¾" thickness shall be manufacturer's standard design for solid, louvered or glazed types and shall be insulated in a manner similar to panels. Glazing shall be accomplished without loose mouldings or exposed screws.

Door frames shall be of flush, welded construction and adjustable to normal floor variations.

Hardware cutouts and reinforcements shall be provided in both doors and frames to receive hardware specified hereunder.

8. HARDWARE:

Locksets and latchsets of standard design regularly furnished with metal partitions shall conform to the standard adopted by the hollow metal door man
facturers providing ready interchan

Specifications

When specifying metal partitions, there is a Mobilwall system to meet every need. If it is a new design concept, personalized Furamic Styling by VMP can be of assistance, affording you a coordinated designing, engineering and production service with research *today* on a Mobilwall system of tomorrow. Please consult local VMP offices and representatives for complete and detailed specifications and design data on standard VMP Mobilwall applications, and assistance in design of the new and unique partition systems.

MOVABLE UNIT-PANEL WALLS

WHITE
FLUSH PARTITIONS

UNIT-PANEL

standard prefabricated units

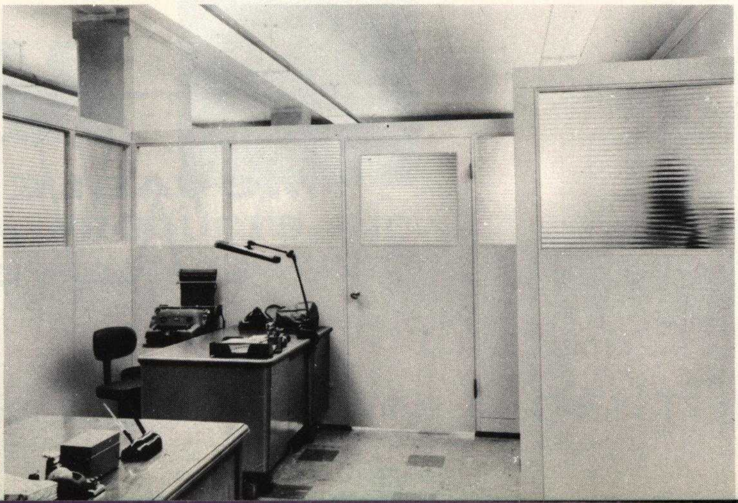
It pays in every way to modernize and organize your working space — beautifully — with UNIT-PANEL Flush Partitions. First, you are assured of easier installation and greater flexibility, and you make a long-range investment. In addition to fine construction from quality materials, you enjoy streamlined flush design, custom quality finish, safety FIRECORE and better sound cushioning — economically. You have a choice of rich "ROCKFACE," the lowest cost *flush* partition on the market . . . or prestige "BIRCHFACE," a *flush* partition with custom look at moderate cost. Both retain factory freshness with minimum upkeep. Both type UNIT-PANEL movable walls are GLAZED AT NO EXTRA COST! Because they're designed for streamlined modern business and adaptable to future growth, progressive offices choose "White" UNIT-PANELS.

MORE FLEXIBILITY, EASIER INSTALLATION!

Because UNIT-PANELS are standardized and prefabricated, flexibility is built right into them. All sections are accurately slotted and slip together quickly and tightly without fastening. Only base and wall scribing are anchored. Yet they are rigid as solid walls due to pinpoint accuracy of fit and concealed screw fastenings. So well engineered that panels can be disassembled and reassembled almost at will — with no costly installation or interference with office work. And White offers a complete design service from layout to finish.

MORE CUSTOM FEATURES FOR LESS!

Though pricing is moderate, you enjoy many of the same features found in custom-built partitions. UNIT-PANELS are flush-designed on both sides for a modern streamlined look, space economy and easy maintenance. UNIT-PANELS arrive beautifully finished from the factory. "ROCKFACE" has a two-coat application in standard Green, or your choice of color on reasonable quantities. "BIRCHFACE" partitions are carefully stained and finished to customer specifications to bring out the beauty of the birch graining. Both partitions contain a 2¼" laminated FIREPROOF asbestos core that cushions sound and reduces fire hazard.



movable walls

UNIT-PANELS ARE BUILT TO LAST, DESIGNED TO ANTICIPATE YOUR CHANGING NEEDS!

Construction Advantages:

Ready for Delivery Anytime! Ready for shipment when your specifications arrive — without a delay. UNIT-PANELS are standardized, prefabricated partitions made up in advance and kept in stock.

Wide Choice of Flexible Units! Available in ceiling height, seven foot, bank type and railing heights . . . and in standard widths, every 6" from 24" to 48", center to center of units. 36" doors and panels are easily interchangeable. Ceiling height partition comes with a choice of prefabricated top units, or variable mineral board top filler, or glazing.

Minimum Installation Expense! Designed and engineered simply and accurately, UNIT-PANELS do not require professional installation, and may be disassembled and reassembled with ease. Complete instructions are included.

Rigid Construction. UNIT-PANELS are rigid as solid walls when locked into position. Both "Rockface" and "Birchface" partitions are a full 2½" thick from face to face, completely filled and reinforced with asbestos.

Safety Fire Core. All panels in cornice high partitions are filled with 2¼" thickness of laminated fireproof asbestos core.

Glazing Included at No Extra Cost! UNIT-PANELS are available in a variety of railing, seven-foot and ceiling high combinations with partial or solid glazing at no extra cost.

Concealed Fastenings and Built-in Wire Chase! All fastenings for baseboard, wall scribing and post are completely concealed. A continuous channel for electrical wires and outlets runs horizontally through the base and header — a similar channel runs vertically through posts. Alternate access wire base available.

SPECIFICATIONS

UNIT-PANEL "ROCKFACE"

Partitions, where indicated on plans, shall be "ROCKFACE" Standard Unit-Panel, prefabricated and all-flush design, as manufactured by White Partitions, Inc., 56 East Glenwood Ave., Hyde Park 36, Mass., and installed at project by their contractor.

Panel and Trim faces veneered with $\frac{1}{8}$" asbestos board. $2\frac{1}{2}$" panels banded with wood frame, with glued-in corrugated asbestos.

Posts: $2\frac{1}{2}$" x 1" standard. $2\frac{1}{2}$" x 4" where required for electrical outlets.

Top cornice and base: $2\frac{1}{2}$" x 4" asbestos board face on laminated wood core. Has continuous wire chase. Base is continuous and secured to floor with steel pins.

Doors: Flush type $\frac{1}{8}$" 3-ply gum on kiln-dried laminated wood core. $1\frac{3}{8}$" x 6'8" in 2'0", 2'6" and 3'0" widths. Factory fitted to frame.

Glass: Standard is double thick clear or $\frac{1}{8}$" luxlite.

Hardware: One pair $3\frac{1}{2}$" x $3\frac{1}{2}$" button tip brass plated butts. Lock or latch sets are supplied. Doors may also be factory cut in for hardware to be supplied by others.

Superstructure to Ceiling: Prefabricated units $2\frac{1}{2}$" face to face of corresponding unit widths to line vertically with 7' high units in variable height up to 76". May be of glazed sash or solid asbestos face.

Pivot or hinged transoms over doors or elsewhere as required.

Superstructure Alternate: May be of flush mineral board filler on wood frame or a combination of sash and filler for exceptionally high ceilings.

Finish: Two factory finish coats in standard green.

UNIT-PANEL "BIRCHFACE"

Partitions, where indicated on plans, shall be "BIRCHFACE" Standard Unit-Panel, prefabricated and all-flush design, as manufactured by White Partitions, Inc., 56 East Glenwood Ave., Hyde Park 36, Mass., and installed at project by their contractor.

Panels and Trim: All trim faces of clear birch. $2\frac{1}{2}$" panels banded with wood frame, and faced both sides with 3-ply birch panel on all asbestos core.

Posts: $2\frac{1}{2}$" x 1" standard. $2\frac{1}{2}$" x 4" where required for electrical outlets.

Top cornice and base: $2\frac{1}{2}$" x 4" birch face on laminated wood core, and has continuous wire chase. Base is continuous and secured to floor with steel pins.

Doors: Flush type $\frac{1}{8}$" 3-ply birch on kiln-dried laminated wood core. $1\frac{3}{8}$" x 6'8" in 2'0", 2'6" and 3'0" widths. Factory fitted to frame.

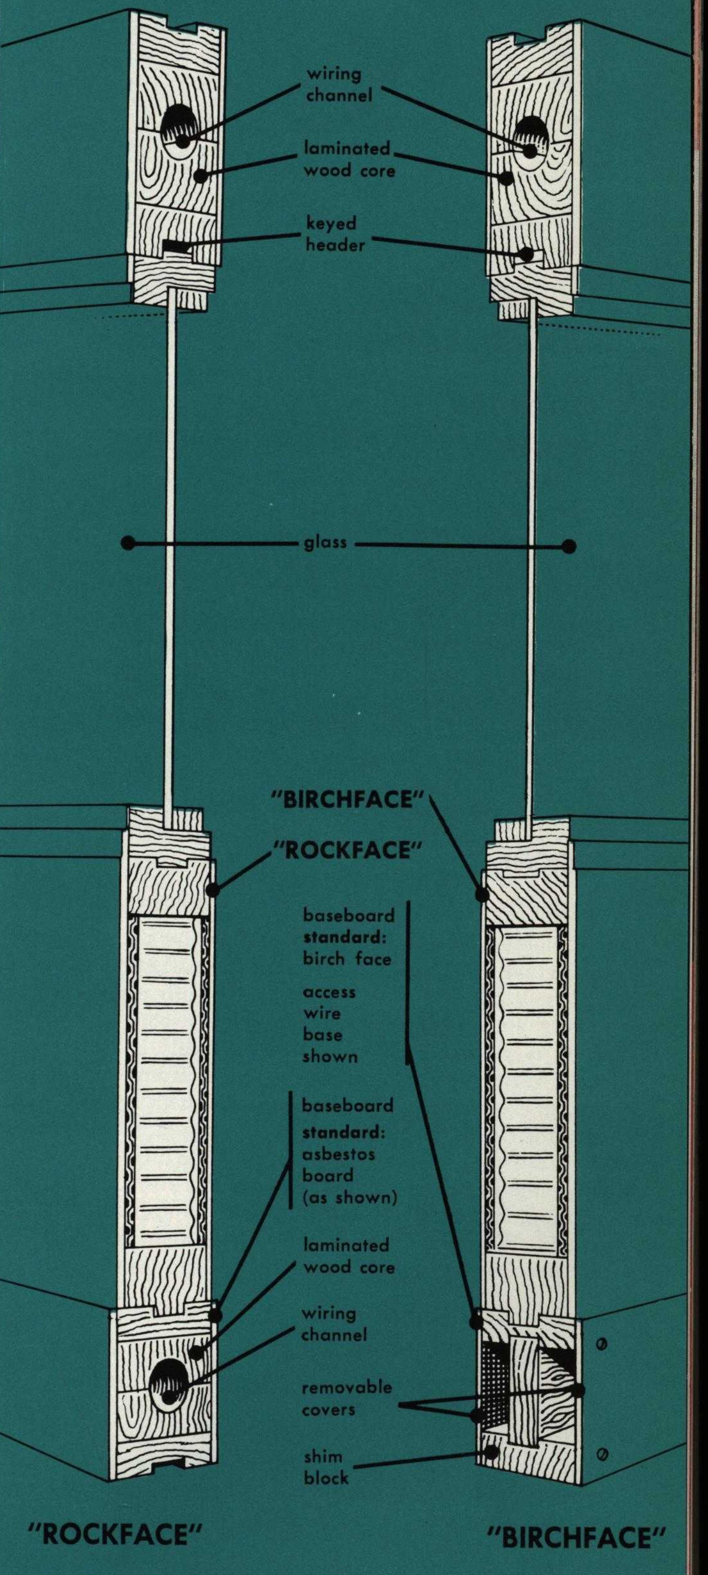
Glass: Standard is double thick clear or $\frac{1}{8}$" luxlite.

Hardware: One pair $3\frac{1}{2}$" x $3\frac{1}{2}$" button tip brass plated butts. Lock or latch sets are supplied. Doors may also be factory cut in for hardware to be supplied by others.

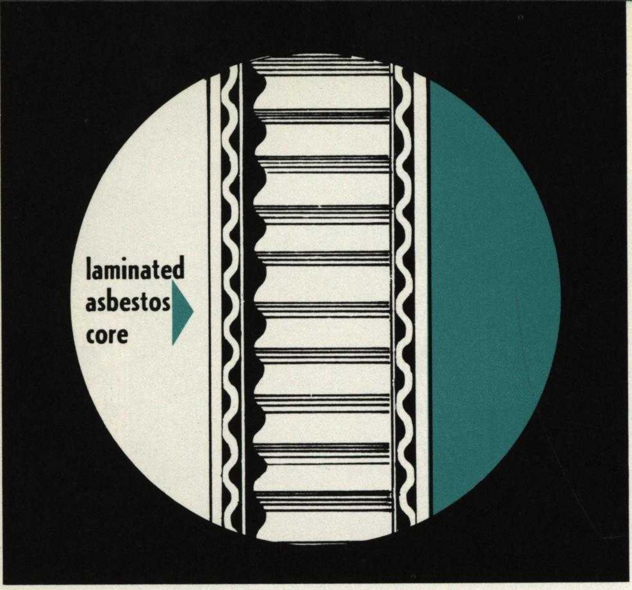
Superstructure to Ceilings: Prefabricated units $2\frac{1}{2}$" face to face of corresponding unit widths to line vertically with 7' high units in variable height up to 76". May be of glazed sash or solid "BIRCHFACE." Pivot or hinged transoms over doors or elsewhere as required.

Superstructure Alternate: May be of flush mineral board filler on wood frame or a combination of sash and filler for exceptionally high ceilings.

Finish: Complete factory finish, 1 coat stain filler to desired color, sealer coat sanded, and finished coat of semi-gloss furniture lacquer. "BIRCHFACE" also furnished natural for finish by others.



SECTION SHOWING CONSTRUCTION



"ROCKFACE"

the Lowest Cost Flush Partition on the Market

More and more offices, plants and institutions are appreciative of the tailored good looks and flexibility of this partition. The initial cost is amazingly low, the upkeep easy, and the design basically so good that it is adaptable to new and changing needs. Moreover, because of its streamlined simplicity, "ROCKFACE" affords space control tailor-made to just the right degree of privacy or semi-privacy necessary in any given work situation. And its careful factory-painted finish lends itself readily to future changes in interior decorating. Modern "ROCKFACE" answers the increasing need for flush partitions that are quickly assembled, budget-priced, impressive and designed for the future. See preceding page for complete specifications.

"BIRCHFACE"

the Flush Partition with a Custom Look

Chosen by executives who know the value of putting up a good front fortified by quality construction. Key offices can now afford natural wood walls with all the warmth, beauty and richness of custom quality paneling. Adaptability is its strong point. "BIRCHFACE" is available in a wide variety of rich stains ranging from traditional to late modern, all of which maintain their original beauty indefinitely and eliminate costly upkeep. Moreover, the units assemble with an ease that only "White" prefabricated precision partitions offer, and are so constructed that expansion or new office plans are vastly simplified. "BIRCHFACE" flush partitions are an investment in the future. See preceding page for complete specifications.

Easier to Assemble and Disassemble!

UNIT-PANELS are so precisely prefabricated that even amateurs have no difficulty installing any of the four heights quickly, with the minimum of inconvenience. First, the continuous base and wall scribing are put up and anchored. The base is secured to the floor by steel pins located about every four feet. Then, all the other components slip neatly into grooves pre-set according to the individual requirements.

Like the base, the header on the seven foot partition is continuous. A mineral board filler may be installed above to form a ceiling high partition. The header top cap is counterbored and screwed through the top into the vertical rib, post and filler members.

To disassemble, the procedure is easily and quickly reversed.

Complete Assembly Instructions Supplied!

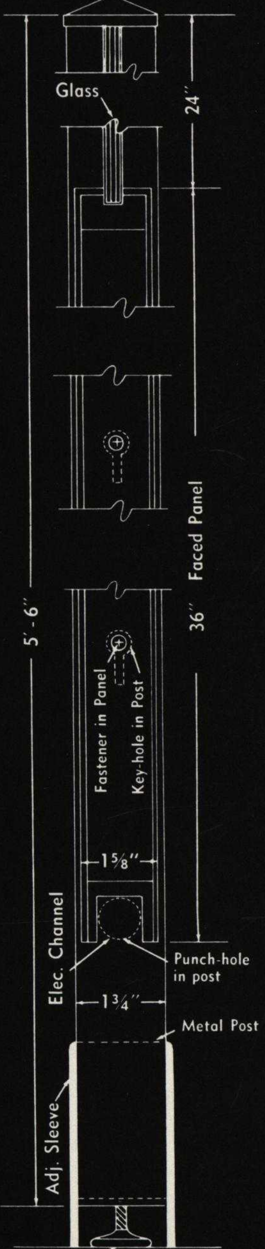
V. I. P. PANEL



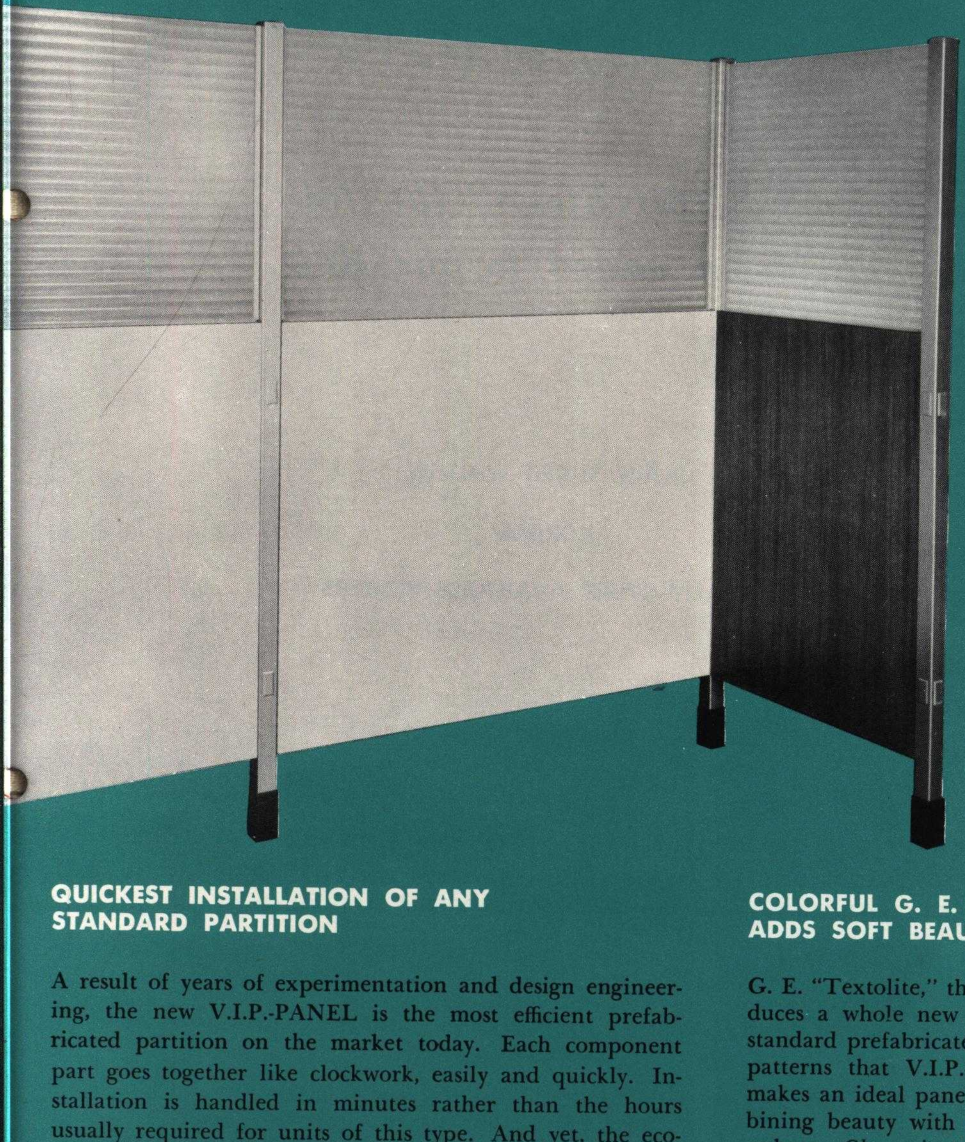
WHITE

PARTITIONS INC.

Introducing AN ENTIRELY NEW CONCEPT IN MOVABLE WALLS!

WHITE's NEW V.I.P. PANEL

FEATURING FAMOUS G.E. Textolite® LAMINATED SURFACING



FOR THE LOOK OF PERMANENT LUXURY IN A MATTER OF MINUTES

QUICKEST INSTALLATION OF ANY STANDARD PARTITION

A result of years of experimentation and design engineering, the new V.I.P.-PANEL is the most efficient prefabricated partition on the market today. Each component part goes together like clockwork, easily and quickly. Installation is handled in minutes rather than the hours usually required for units of this type. And yet, the economical V.I.P.-PANEL excels in beauty and construction, giving the appearance of custom design and costly installation.

The V.I.P.-PANEL offers unbeatable custom features at a *budget price:* the greatest variety of paneling colors and designs ever offered . . . streamlined flush design . . . easy adaptability to future expansion . . . and finely engineered construction features both inside and out. *Honeycomb Core* is puncture-proof, cushions sound, strengthens walls. *Universal Posts* made of heavy gauge metal come fitted with keyhole adapters, finial caps and metal channels for glazing. *Glazed to Order* with your choice of glass. *Floor Glides* included for leveling panels.

COLORFUL G. E. "TEXTOLITE" ADDS SOFT BEAUTY, HARD WEAR

G. E. "Textolite," the long-lived laminated surfacing, introduces a whole new trend in beauty paneling. No other standard prefabricated units offer the variety of colors and patterns that V.I.P.-PANELS can give you. "Textolite" makes an ideal paneling for every type of work area, combining beauty with exceptional durability and almost no upkeep. *Cleans instantly* with a damp cloth! *Will not chip or crack! Resists stains and scratches!* Even the top rails, on both sides of the glazing where wear is greatest, are protected by "Textolite."

Standard V.I.P.-PANELS are immediately available from stock in modern shades of green, gray, beige and wood grain. On special orders you have unlimited choice — G. E. "Textolite" comes in over 70 varieties! Interior decorating to your own specifications is smart and thrifty with "Textolite"-faced V.I.P.-PANELS selected from a full range of solid colors, authentic wood grains, luxurious marbles and stylized patterns. And with all this beauty, you get unbeatable durability.

complete design service . . .

White Partitions, Inc. is prepared to assist you in the planning of any movable partition installation. Our engineers are thoroughly experienced in "space-economy" design for partition installation. We can handle the complete job from initial layout planning and complete fabrication to final installation, or we can assist you on any specific problem relative to your own plan.

Complete unit layouts for all jobs are submitted for approval before shipment. If installation by others, complete instruction data is included. Quotations are given on (1) complete installations with our forces, (2) delivered job site for erection by others.

Our installations predominate the northeast, southeast and mid-west. Our dealer coverage extends north to Ottawa, Canada, south to Roanoke, Virginia and west to Cincinnati, Ohio. Outside of this general area we are in a position to provide design service and to handle specific projects on a limited basis.

In addition to standard "Birchface" the following veneers have been added to our line of natural wood finishes.

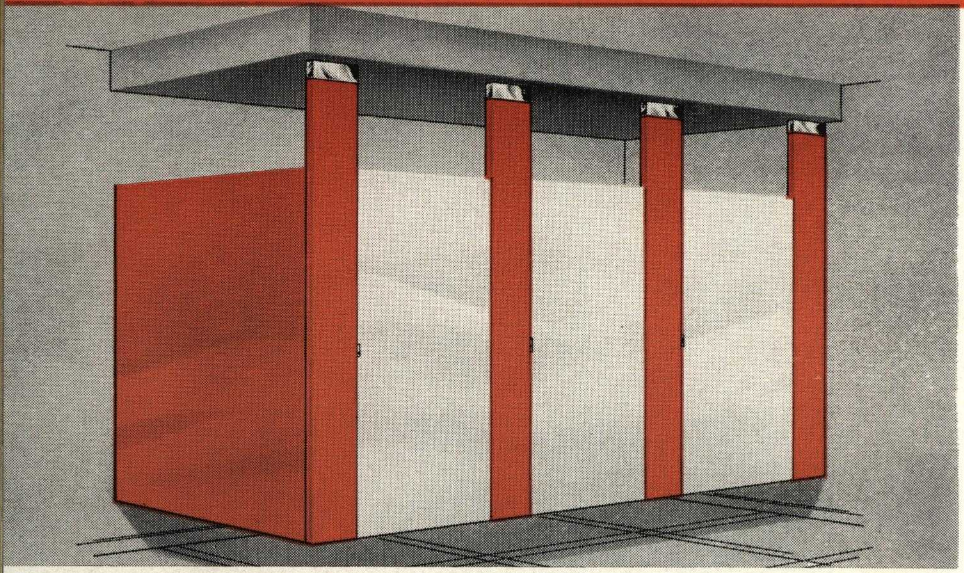
metal toilet compartments

The toilet compartments described on the following pages have been especially designed for beauty and appearance, strength of construction and durability in service. Nearly a quarter century of experience in engineering and manufacturing skill in production of precision tools has gone into the design and fabrication of our enclosures. Practical design, quality materials, precise fabrication and beautiful finishes make Accurate installations the finest obtainable. Hardware is of the best quality and designed and manufactured for durability and appearance.

Ardmore/ ceiling hung type



Designed to be rigidly supported from the ceiling and providing a floor area free from obstructions which simplifies cleaning when wall hung fixtures are used. Structural overhead supports furnished by others (generally specified under miscellaneous ornamental iron contract) are to be installed 7'-6" from floor to insure satisfactory installation.

metal toilet compartments

Specifications

GENERAL—Toilet Compartments shall be (insert for type) as manufactured by the ACCURATE PARTITIONS, INC. McCook, Illinois.

MATERIALS—All steel sheets shall be stretcher leveled, extra smooth finish galvanized bonderized steel. Separating partitions and doors shall be 20 ga. steel. Ardmore, Bayport and Drexel type pilasters to be 16 ga. steel, Concord type pilasters to be 20 ga. steel. Wall and pilaster stirrup brackets enameled to match partitions or chrome plated if specified. Pilaster base trim shall be polished stainless steel.

CONSTRUCTION—All partitions, doors, and pilasters shall be flush construction with fibre board sound-deadening core, cemented under pressure approximately one inch thick for partitions and doors, and 1¼ inch thick for pilasters. All sheets shall have formed edges and be interlocked under tension with continuous crown moulding mitred and welded at sides and corners. Concord type (overhead braced) shall be securely braced with continuous 18 ga. one inch by 1¾ inch tubular steel headrail extending full length of installation.

HARDWARE—All doors to be ***Accurate*** "Stay-Level" non-rising type adjustable to permit door to remain at any desired position and equipped with ***Accurate "400"*** concealed position controlled cam action door hinge. Each door to be mounted with top and bottom chrome plated hinge brackets of cast alloy non-ferrous material. The top pivot hinge bracket to be recessed into the cast alloy reinforced inset door fitting and supported with a corrosion resistant pivot pin mounted in a nylon bearing and locked into door fitting above and below bearing point. The lower hinge bracket to be recessed into cutout at bottom corner of door and firmly fixed to the corrosion resistant cam member extended within the door against a ball bearing roller positioning device securely fastened to door. All moving parts shall operate on nylon and frictionless bearings. Each door shall be fitted with heavy brass chrome plated strike and latch keeper, slide bar latch, coat hook and bumper, all fastened with tamper proof fastenings.

FINISH—All metal shall be thoroughly cleaned and phosphatized and given coat of zinc chromate rust resisting primer, baked on and followed by two coats of high-temperature baked synthetic enamel providing a uniform and protective finish.

Headrail	----------	18 ga.

COMPARTMENTS

Width—30, 32, 34 and 36 inches, center to center of compartment
Depth—57 inches. Height of partitions and doors—58 inches
Distance from floor to bottom of partitions and from doors to headrail—12 inches
Distance from floor to top of headrail—82 inches
Distance from floor to top of partitions and doors—70 inches

PILASTERS

Width—4, 5, 6, 8, 10 and 12 inches

DOORS

Width—22, 24, 26, 28, 30, 32 and 34 inches

The foregoing dimensions comply with the modular system of dimensional co-ordination and standard stock sizes for panels, doors and pilasters.

Sales representatives may be found by consulting the yellow pages of your local telephone directory or contact us direct.

ALL METAL PARTITION COMPANY, INC.
194-204 Dupont Street • Brooklyn 22, N.Y.C.

ALL METAL partitions

Twenty-five years of experience and technical knowledge as well as outstanding construction features result in quality installations of All Metal Partitions in existing, remodeled or new buildings.

Sturdily constructed, All Metal Partitions are designed to provide maximum performance and better sanitation. Fittings and hardware have been awarded special attention for function and adjustability to suit various field conditions.

All Metal Partitions range in cost from the economical but thoroughly satisfactory "Panel Type" to the most modern "Flor-Clear" Type which is suspended from the ceiling and offers the desirable feature of ease of maintenance.

features

- Constructed of galvanized steel or furniture steel of heavy gauge.
- Double reinforcement of edge with an outer moulding and an inner full length die-drawn circular tube forming a seal against condensation and moisture.
- High quality enamel finish in a choice of decorator colors.
- Designed to provide low-cost maintenance.
- All Metal Partitions are equipped with superior, trouble-free fittings and "Time-Test" hardware.
- Adaptable to all types of architectural and interior design.

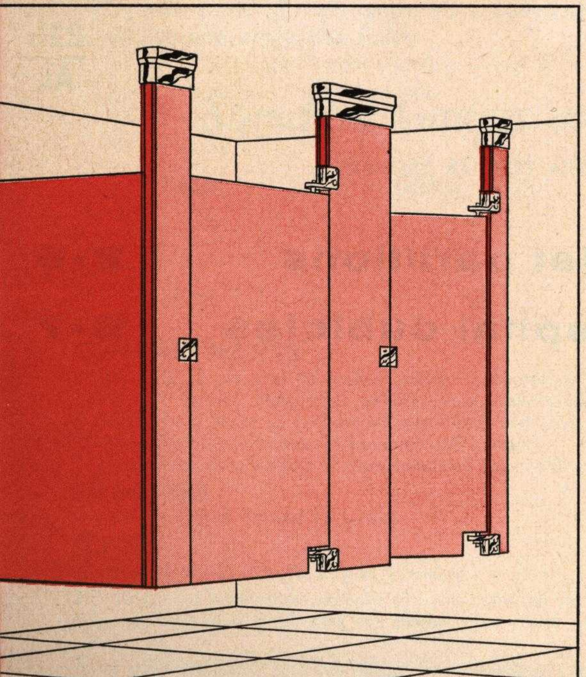
building types

All Metal Partitions are recommended for educational institutions, commercial and office buildings, industrial plants, restaurants, hospitals, airline and railroad terminals, etc.

colors

Color finish for All Metal Partitions is baked-on enamel applied over galvanized-bonderized steel or furniture steel. All Metal Partitions may be incorporatd with any contrasting or related color scheme; twelve attractive standard colors are available. Color chart on request.

toilet partitions Flor-Clear type



specifications

General: All toilet compartments shall be "All Metal" Flor-Clear Type construction, as made by All Metal Partition Company, Inc., Brooklyn, N.Y.

Dividing Partitions: All partitions shall be finished to a thickness of 1 in. and formed of two sheets of 20 gauge full pickled, cold rolled, stretcher level, furniture steel (galvanized bonderized if specified) cemented with waterproof rust-proofing cement at high pressure to a sound deadening fibrous core. Edges shall be interlocked with 20 gauge half round steel die drawn moulding with all corners mitered, welded and ground. All joints shall be permanently locked and sealed against moisture and condensation with a continuous die-drawn circular split tube. Partition slabs shall be attached to walls and pilasters by means of malleable iron stirrup brackets.

Suspended stiles shall be built similar to Dividing Partition except that same shall finish 1¼" thick. Top edge shall be reinforced for ceiling connection by means of a heavy crossbar member and jack screw levelling device shall be concealed by a stainless steel shoe three inches high.

Doors: Doors shall be flush 1 in. thick and of same design and construction as specified for dividing partitions with necessary reinforcements for hardware. Doors shall be hung on gravity hinges designed for quiet closing or to remain open at any angle.

Fittings: Wall fittings shall be malleable iron, designed for adjustability to suit various field conditions.

Finish: Finish shall be quality enamel over prime coat baked on at high temperature to insure even polymerization in any of "All Metal" standard colors.

Hardware: All hardware shall be "All Metal" standard, consisting of concealed hinge. Slide latch, strike, pull combination hook and bumper, of non-ferrous metal, chromium plated.

specifications

General: All toilet compartments shall be "All Metal" DeLuxe Flush Type construction, as made by All Metal Partition Company, Inc., Brooklyn, N.Y.

Dividing Partitions: All partitions shall be finished to a thickness of 1 in. and formed of two sheets of full pickled, cold rolled, stretcher level, furniture steel (galvanized bonderized if specified) (20 gauge for large panels) (22 gauge for small panels) cemented with waterproof rust-proofing cement at high pressure to a sound deadening fibrous core. Edges shall be interlocked with 20 gauge half round steel die drawn moulding with all corners mitered, welded and ground. All joints shall be permanently locked and sealed against moisture and condensation with a continuous die-drawn circular split tube which is interlocked with the crown moulding. Partition slabs shall be attached to walls and pilasters by means of malleable iron stirrup brackets.

Front Stiles: Front Stiles shall be of flush type 1¼ in. thick, made of two sheets of 20 gauge full pickled, cold rolled, stretcher level, furniture steel (galvanized bonderized if specified) cemented with waterproof rust-proofing cement to a sound deadening core of high pressure. Stile shall be fastened to floor by means of a fitting designed for vertical adjustment. Floor connection shall be concealed with a stainless steel shoe three inches high.

Doors: Doors shall be flush 1 in. thick and of same design and construction as specified for dividing partitions with necessary reinforcements for hardware. Doors shall be hung on gravity hinges designed for quiet closing or to remain open at any angle. Doors when in a closed position shall line up with top of stiles with no hardware or fittings protruding.

Fittings: Wall fittings shall be malleable iron, designed for adjustability to suit various field conditions.

Finish: Finish shall consist of one prime coat and a finish coat of Baked-On Enamel in any of "All Metal" standard colors.

Hardware: All hardware shall be "All Metal" standard, consisting of concealed hinge. Slide latch, strike, pull, combination hook and bumper, of non-ferrous metal, chromium plated.

specifications

General: All toilet compartments shall be "All Metal" (Flush Type and Panel Type) construction, as made by All Metal Partition Company, Inc., Brooklyn, N.Y.

Fittings: Headrail fittings shall be plain heavy type cast aluminum designed for adjustability to suit various field conditions. Stirrup brackets shall be of wrought steel. All fittings shall be enameled to match the partitions. Post shoes shall be (cast alloy, chrome plated), (cast aluminum, enameled).

Finish: Finish shall consist of one prime coat and a finish coat of Baked-On Enamel in any of "All Metal" standard colors.

Hardware: All hardware shall be "All Metal" standard, consisting of hinge and hinge brackets, slide latch, strike, pull, combination hook and bumper, all of non-ferrous metal, chromium plated. (If economy is a necessity, specify malleable iron, enameled.)

Door Construction: Doors shall be of flush type construction, formed of two sheets of 22 gauge, full pickled, cold rolled stretcher level furniture steel, cemented at high pressure to a sound deadening core and reinforced with tubular members at each vertical edge. Doors shall be hung on gravity hinges designed for quiet closing or to remain open at any angle.

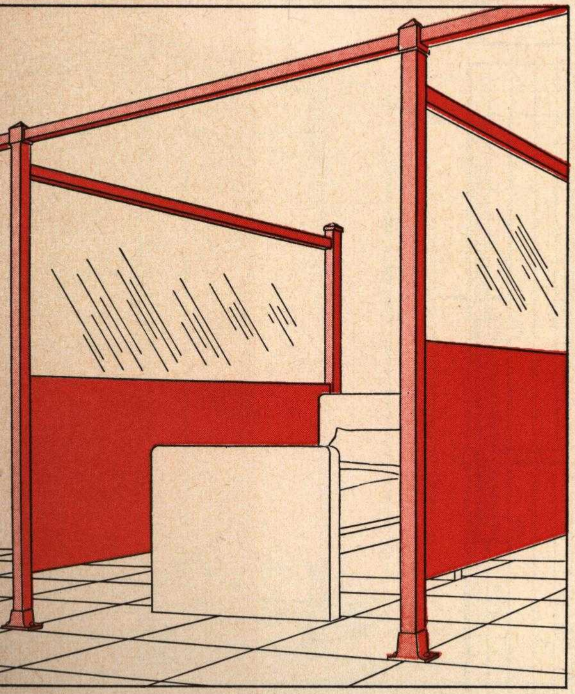
Additional specifications continue on opposite page.

toilet partitions

flush and panel type

hospital cubicles

flush type



specifications

"All Metal" Hospital Cubicles can be advantageously used where the division of rooms are desired, for privacy and/or isolation. Their use in the ward or semi-private room makes it possible to keep the patient separated at a minimum cost and inconvenience. They may also serve as windshield to prevent drafts.

The "All Metal" Cubicle line is quite flexible in scope, presenting the architect his choice as to steel and glass, or all steel construction. They are available in various heights and can be built up from floor to ceiling.

"All Metal" Hospital Cubicles are of Flush type and are adaptable to all purposes and uses in wards, semi-private rooms or corridors. They permit privacy, but when of steel and glass construction, allow full visibility. They are ideal as wind-breakers and in eliminating drafts.

The "All Metal" Flush Cubicle is available in various heights and can be built up from floor to ceiling. They are well suited for use as isolation cubicles and nurses' stations. They can be had in either solid steel or steel and glass construction.

"All Metal" Flush Cubicles are rigidly constructed. Posts or standees are 2 in. square welded tubes. Panels are 1½ in. thick and are formed of two sheets of steel cemented to a fibrous core and reinforced at all necessary points. Panels are locked to post with specially designed three-point locking device, then welded in place. Rails are of hollow metal, interlocked and welded to post.

When partition is of steel and glass construction, glass is held in recess formed in top of panel and intermediate rail, then is secured vertically by sanitary shaped mouldings, screwed on.

"All Metal" Flush Cubicles can be had either free-standing or braced by head rail. Cubicles are verminproof and easy to maintain.

Finish shall consist of prime coat and a finish coat of Baked-On Enamel in any of "All Metal" standard colors.

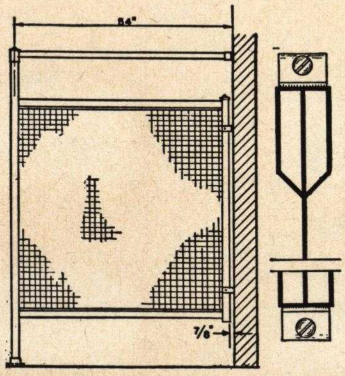
flush type

Dividing Partitions: All partitions shall be flush, approx. 15/16 in. thick and formed of two sheets of full pickled, cold rolled, stretcher level, furniture steel (20 gauge for large panels) (22 gauge for small panels) cemented with waterproof rust-proofing cement at high pressure to a sound deadening fibrous core. Edges shall be interlocked and all joints permanently locked and sealed against moisture and condensation with a continuous die-drawn circular split tube. Partition slabs shall be interlocked to a 1¾ in. square post by a four hook self-locking device which draws slabs and posts together in a permanent tension grip and is then welded in place. The contact edges between posts and panels shall form a flush joint. Headrail shall be 1½ in. x 1½ in. square steel tubing.



panel type

Dividing Partitions and Front Panels: All partitions shall be formed of a single sheet of stretcher level, cold rolled, furniture steel inserted into surrounding frame members for their entire depth, interlocked and welded to form one solid unit. All partitions shall be built with top and bottom rails of sanitary shaped tubing and 1¾ in. square tubular front and back posts. Headrail is to be of 1½ in. x 1½ in. square tubing.

AMERICAN SANITARY PARTITION CORPORATION 1960

planning the rest room

so important to public relations

Sanitation and cleanliness are the primary requisites of modern living. Attractive, sanitary restrooms contribute to public relations as well as to everyday comfort and convenience.

American Sanitary Partitions are not only attractive and modern in appearance, but are built for service and durability.

For 29 years we have extended our efforts to produce a stronger and more sanitary partition unit and have contributed to many developments in this field.

new partition line

The Plastic Laminate Toilet Partition is our latest development in modern design for sanitary and attractive restrooms.

The surface material used for this product is a high-pressure decorative laminated plastic. It is hard and smooth, highly resistant to wear and scratching, yet warm and pleasant to the touch. It will never rust and needs no refinishing and comes in a wide variety of eye-appealing patterns and colors.

technical services

Our experienced representatives located throughout the country (see list on back cover) are a proven asset, not only to the company, but to architects and customers as well. Consultation services for preliminary estimates, layouts and on all matters pertaining to this line of business are available from our local representatives.

stock materials

Due to standardization of toilet room sizes and general layout, we are able to stock certain materials for immediate shipment. Refer to page 11 for complete list of stock items.

decorator color chart

Toilet Partitions, subject to frequent washing and cleaning as well as to various acid conditions require better than the usual protection. Through continuous tests and research we have, with the cooperation of our paint manufacturers, Pratt and Lambert, developed a synthetic baking enamel which strongly resists these conditions. These new colors are made of the highest quality of raw materials with titanium dioxide pigment and synthetic resins and applied to a chemically clean material, baked on under high temperature to insure hardness and durability. Following the trend of Coloramics, we have selected our standard colors to a variety of modern shades harmonizing with any surrounding color schemes. Colors other than these may be specified, at slightly higher cost. While every effort to furnish an identical reproduction of your selected color will be made, a slight allowance for the paint manufacturer's shade tolerance must be considered.

standard fittings and hardware

American Sanitary compartments are **ALL PRE-DRILLED** for **ALL** door hardware and for **ALL** dividing partition-to-pilaster attachments, thus reducing field costs and eliminating study and interpretation of complicated template drawings, etc.

Heavy wrought steel headrail and wall fittings with smooth sanitary corners are enamelled to match partition units. Fittings are easily applied and are adjustable to job conditions.

"TROUBLE-PROOF" door hardware

The use of the 3-point supported top pivot together with "Zytel" Nylon and Stainless Steel working parts assures long-lasting, trouble-free operation of the "TROUBLE-PROOF" Hinge Set.

Standard make accessories, including paper holders, utility shelves and other related items can be furnished at extra cost.

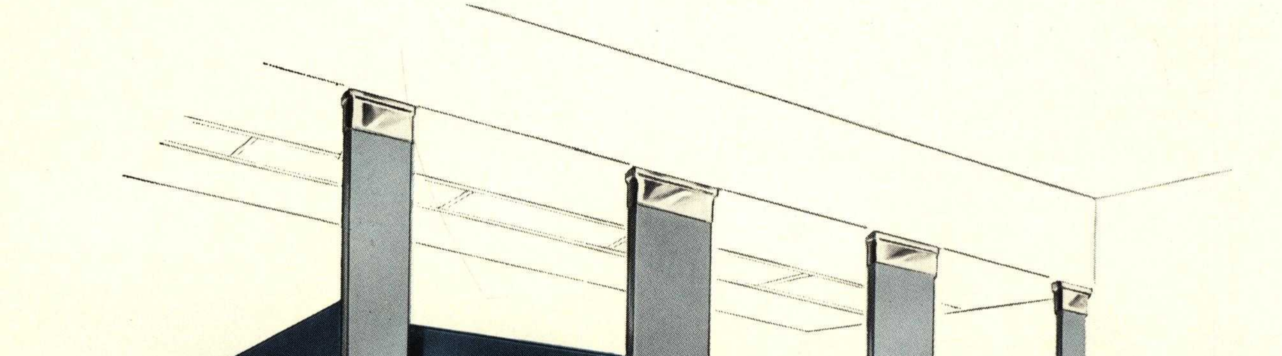
ceiling stile TYPE "CS"



Ceiling Hung Partitions offer exceptional attractiveness and help to achieve the effects required in today's ultra modern washrooms.

This outstanding development creates an unobstructed floor area which simplifies cleaning and reduces the continuous cost of maintenance.

specifications

General: Toilet compartments shall be Type "CS" as manufactured by American Sanitary Partition Corporation, New York, N. Y. *Note:* Structural members required in ceiling to fasten Stiles shall be provided by others.

Materials: All steel shall be galvanized bonderized, stretcher levelled. Stiles shall be of 16 gauge material, Panels of 20 gauge and Doors of 22 gauge. Panel and Door Edge moulding shall be of 20 gauge.

Construction: Stiles, Panels and Doors shall be of veneer steel construction laminated to a honeycomb filler of correct dimension producing a Stile unit of not less than 1¼" thick and Panel and Door units of not less than 1" thick. All corners shall be welded and ground smooth. Stile and Panel and Door units shall be reenforced internally and prepierced for the application of fittings and hardware.

Fittings: Shall be of wrought steel and adjustable to keep Panels and Stiles clear from walls and floor. Except for 3" high cover base of polished *stainless steel* all other fittings shall be enamelled to match partitions.

Finish: All material shall be chemically cleaned, given one coat of rust resisting primer and one coat of synthetic baked enamel of one or two of our standard colors.

Hardware: Doors shall be equipped with "TROUBLE-PROOF" Hinge Set or approved equal. Each hinge set shall consist of Cast Alloy Non-Ferrous Metal Chrome Plated hinge brackets. The top pivot shall be recessed into the edge of the door 2½" below the top; heavy stainless steel pivot pin operating in a "Zytel" Nylon bearing shall be anchored above and below the top hinge bracket. The operation of the door shall be controlled by the lower hinge unit which consists of a heavy stainless steel pintle and mating "Zytel" Nylon cams which permit setting of the door at any desired position when door is not latched. Bumper and Keeper shall be of 18-8 stainless steel polished to a high lustre. Slide Latch and Coat Hooks shall be of cast alloy non-ferrous metal chrome plated. All hardware except Coat Hooks shall be through bolted. One way type theft proof screws and fasteners shall be provided for all hardware.

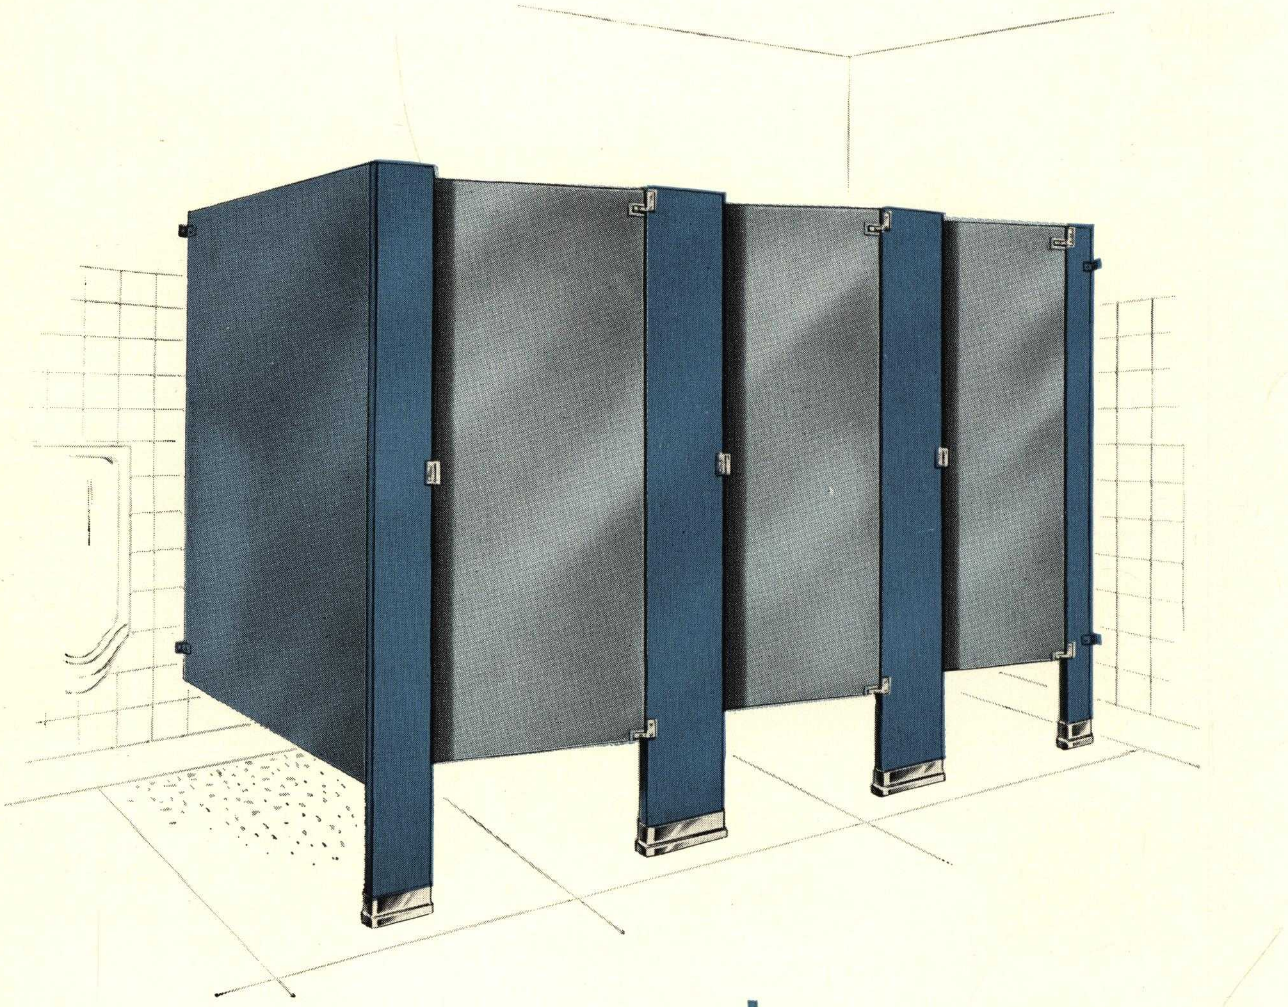
floor stile TYPE "FS"



Floor Stile Partitions offer a feeling of airiness by accenting the ceiling height. The flush and clean horizontal lines complement today's modern architecture.

specifications

General: Toilet compartments shall be Type "FS" as manufactured by American Sanitary Partition Corporation, New York, N. Y. *Note:* To provide a secure fastening of Stiles a solid sub-floor not over 2″ below the finish floor shall be provided by others.

Materials: All steel shall be galvanized bonderized, stretcher levelled. Stiles shall be of 16 gauge material, Panels of 20 gauge and Doors of 22 gauge. Panel and Door Edge moulding shall be of 20 gauge.

Construction: Stiles, Panels and Doors shall be of veneer steel construction laminated to a honeycomb filler of correct dimension producing a Stile unit of not less than 1¼″ thick and Panel and Door units of not less than 1″ thick. All corners shall be welded and ground smooth. Stile and Panel and Door units shall be reenforced internally and prepierced for the application of fittings and hardware.

Fittings: Shall be of wrought steel and adjustable to keep Panels and Stiles clear from walls. Except for 3″ high cover base of polished *stainless steel* all other fittings shall be enamelled to match partitions.

Finish: All material shall be chemically cleaned, given one coat of rust resisting primer and one coat of synthetic baked enamel of one or two of our standard colors.

Hardware: Doors shall be equipped with "TROUBLE-PROOF" Hinge Set or approved equal. Each hinge set shall consist of Cast Alloy Non-Ferrous Metal Chrome Plated hinge brackets. The top pivot shall be recessed into the edge of the door 2½″ below the top; heavy stainless steel pivot pin operating in a "Zytel" Nylon bearing shall be anchored above and below the top hinge bracket. The operation of the door shall be controlled by the lower hinge unit which consists of a heavy stainless steel pintle and mating "Zytel" Nylon cams which permit setting of the door at any desired position when door is not latched. full flush TYPE "FF"

The Full Flush model is the most popular type of toilet partition available today. It reflects the modern appearance of more expensive types, yet does not require special structural provisions to effect a rigid installation. Flush stiles minimize maintenance operations, just as on all expensive types.

specification

General: Toilet compartments shall be Type "FF" as manufactured by American Sanitary Partition Corporation, New York, N. Y.

Materials: All steel shall be cold rolled stretcher levelled furniture steel (*Alternate:* All steel shall be galvanized bonderized, stretcher levelled.) Stiles and Panels shall be of 20 gauge and Doors of 22 gauge material. Panel and Door Edge moulding shall be of 20 gauge and Headrail rectangular 20 gauge 1" x 1½" lock joint tubing.

Construction: Stiles, Panels and Doors shall be of veneer steel construction laminated to a honeycomb filler of correct dimension producing a Stile unit of not less than 1¼" thick and Panel and Door units of not less than 1" thick. All corners shall be welded and ground smooth. Stile and Panel and Door units shall be reenforced internally and prepierced for the application of fittings and hardware.

Fittings: Shall be of wrought steel and adjustable to keep Panels and Stiles clear from walls. Except for 3" high cover base of polished *stainless steel* all other fittings shall be enamelled to match partitions.

Finish: All material shall be chemically cleaned and given one coat of rust resisting primer and one coat of synthetic baked enamel of one or two of our standard colors.

Hardware: Doors shall be equipped with "TROUBLE-PROOF" Hinge Set or approved equal. Each hinge set shall consist of Cast Alloy Non-Ferrous Metal Chrome Plated hinge brackets. The top pivot shall be recessed into the edge of the door 2½" below the top; heavy stainless steel pivot pin operating in a "Zytel" Nylon bearing shall be anchored above and below the top hinge bracket. The operation of the door shall be controlled by the lower hinge unit which consists of a heavy stainless steel pintle and mating "Zytel" Nylon cams which permit setting of the door at any desired position when door is not latched. Bumper and Keeper shall be of 18-8 stainless steel polished to a high lustre. Slide Latch and Coat Hooks shall be of cast alloy non-ferrous metal chrome plated. All hardware except Coat Hooks shall be through bolted. One way type theft proof screws and fasteners shall be provided for all hardware.

plastic laminate TYPE "PL"

Toilet partitions surfaced with high-pressure decorative laminated plastic are the latest development of modern materials and design for sanitary and attractive restrooms.

Our use of laminated plastic with its proven superiority to other more commonly used materials together with our many years of experience in the toilet partition industry has produced a toilet partition unit that offers more advantages and beauty than any other materials used to date.

Our design is developed from our metal partition line, incorporating all of the features required to produce a sound, rigid and lasting installation. To these important basic principles, we have added the permanence, beauty and warmth of laminated plastic thus making possible an economical unit which requires little or no maintenance.

These partitions are available in a wide variety of warm, glowing colors and patterns and will delight the architect and decorator with their beauty.

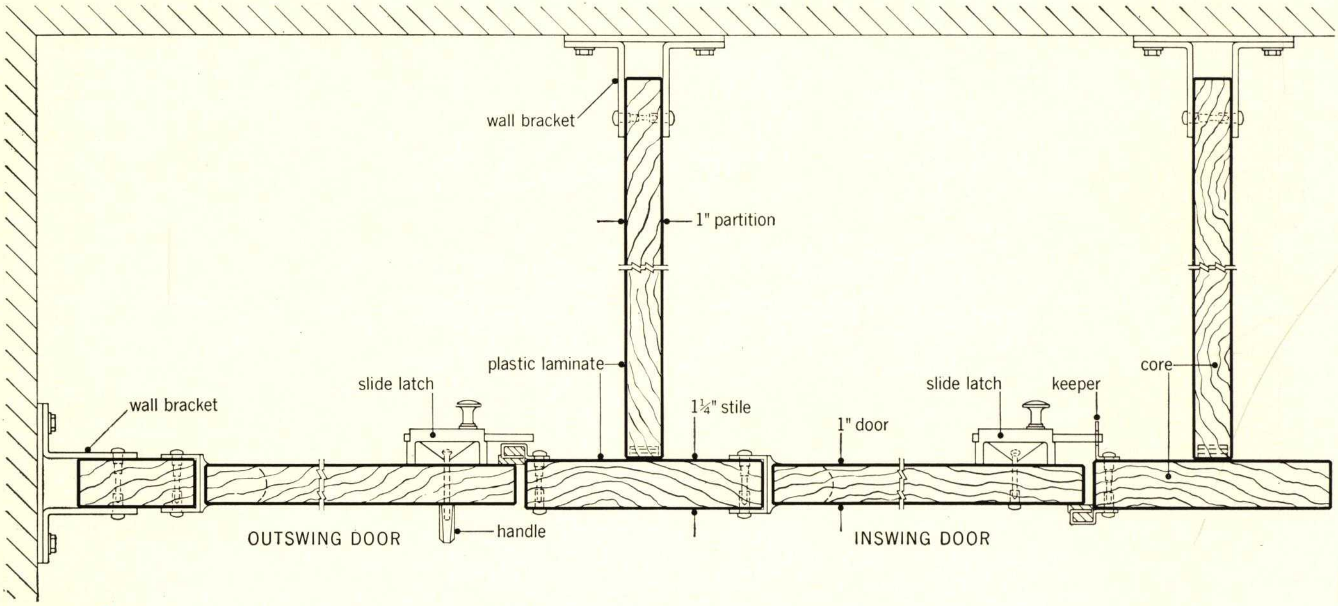
details SCALE: 3'' = 1'-0''



specifications

Type PL-CS, Ceiling Stile, General: Toilet Partitions shall be Type PL-CS Ceiling Stile, as manufactured by American Sanitary Partition Corporation, New York, N. Y.
NOTE: Structural members in ceiling shall be provided by others.

Type PL-FS, Floor Stile, General: Toilet Partitions shall be Type PL-FS Floor Stile, as manufactured by American Sanitary Partition Corporation, New York, N. Y.
NOTE: To provide a secure fastening of stiles, a solid subfloor not over 2" below the finish floor shall be provided by others.

Type PL-FF, Full Flush, General: Toilet Partitions shall be Type PL-FF Full Flush, as manufactured by American Sanitary Partition Corporation, New York, N. Y.
NOTE: Since this type does not require any special ceiling or floor provisions, headrail bracing will be required.

Materials: All surface and edging material shall be 1/16" thick high grade pressure decorative laminated plastic. Core material shall be exterior grade plywood or Nova-Ply.

Construction: Panels and doors shall have laminated plastic bonded to the surfaces and edges of ⅞" thick core to produce a 1" thick panel and door. Stiles shall have laminated plastic bonded to the surfaces and edges of 1⅛" thick core to produce a 1¼" thick Stile.

Fittings: Wall and floor fittings shall be adjustable to keep Panels and Stiles clear of walls and floors. Wall brackets and stile cover base shall be of polished stainless steel.

Hardware: Doors shall be equipped with "Trouble-Proof" Hinge Set or approved equal.

standard and stock sizes

In view of the standardization of toilet room sizes, layouts and fixtures of late, we are able to stock a variety of materials for prompt STOCK shipment. The use of said stock material will assure on-time completion of projects operating under a tight or limited time schedule.

The layout detailed will cover a multitude of job conditions. A special door width at one end of the battery or the other will not delay the STOCK feature.

This stock material is available in the following Types and grades of material finished in any one of our 10 standard colors:

1 CEILING STILE TYPE "CS" Galvanized Bonderized Steel.	PAGES 4 - 5
2 FLOOR STILE TYPE "FS" Galvanized Bonderized Steel.	PAGES 6 - 7
3 FULL FLUSH TYPE "FF" Galvanized Bonderized or Cold Rolled Steel.	PAGES 8 - 9

Individual Type Specifications are naturally adhered to.

unit

CARTHAGE
MARBLE
CORPORATION

STALLPACK® floor mounted toilet enclosures

Stallpack is complete in itself!

Stallpack is a packaged unit containing all the component parts of a standard-sized marble toilet compartment. Stallpack includes: polished Ozark Grey Veined marble partition and mullions, galvanized bonderized steel doors with baked enamel finish, complete set of non-ferrous chrome-plated hardware and instructions for quick installation.

Stallpack looks best!

Its richly gleaming grey marble is unmatched in beauty and adaptability among all other compartments. It replaces the cold, antiseptic glare and rattling echo of painted partitions with the depth and splendor of fine, natural marble.

Stallpack performs best!

Stallpack marble stays shining clean with little effort, never needs paint or repair. Unequalled for durability, the hard Class A marble used in Stallpack will last for the life of your building. Quality Stallpack hardware will not rust or corrode, performs efficiently for years of hard use.

Stallpack is ready for shipment!

Marble partitions and mullions are mass-produced to stock and stored in our warehouse along with Stallpack hardware purchased at quantity prices. Everything is packaged in readiness for immediate delivery. Stallpack is standardized, and that means more quality for less money, more convenience in delivery!

SPECIFICATIONS

general

Toilet compartments shall be Stallpack marble units as manufactured by the Carthage Marble Corporation, Carthage, Missouri. There shall be no posts or headrails. Solid sub-floor not more than 2″ below finish floor shall be provided by others for anchoring the Stallpack stiles. Toilet walls furnished by others must be perpendicular to the floor surface and must be of some solid masonry construction or hollow tile to allow the anchoring of partitions to the walls.

marble

Stiles and partitions shall be of Ozark Grey Veined marble, polished and drilled for installation.

metal doors

Doors shall be flush construction of 22-gauge cold rolled steel, 1″ thick, with fibre board cores cemented under pressure to the inner metal surfaces. Face plates of doors shall have die-formed moulding, mitered and welded at corners. Doors shall be galvanized, bonderized and coated with a rust-resistant synthetic primer followed by synthetic enamel baked at high temperatures.

wood doors (optional)

Birch Veneer Doors shall be chipboard solid core flush doors, 1″ thick, as manufactured by U. S. Plywood Corp. The extruded core shall be made from wood chips and resins.

Edge strips shall be ¾″ hardwood bonded on the two long edges, top and bottom. Cross bands shall be any suitable hardwood not less than 1/12″ and birch face veneers shall be standard rotary cut 1/24″ thick. All face veneers shall be tapeless spliced and stroke sanded. Plies shall be bonded with resin by hot plate presses to meet tests for Type 1 (fully waterproof under CS 35-56 for hardwood plywood).

Finish shall consist of one coat sanding sealer, 2 coats of high solid clear lacquer and one coat of clear satin lacquer.

hardware

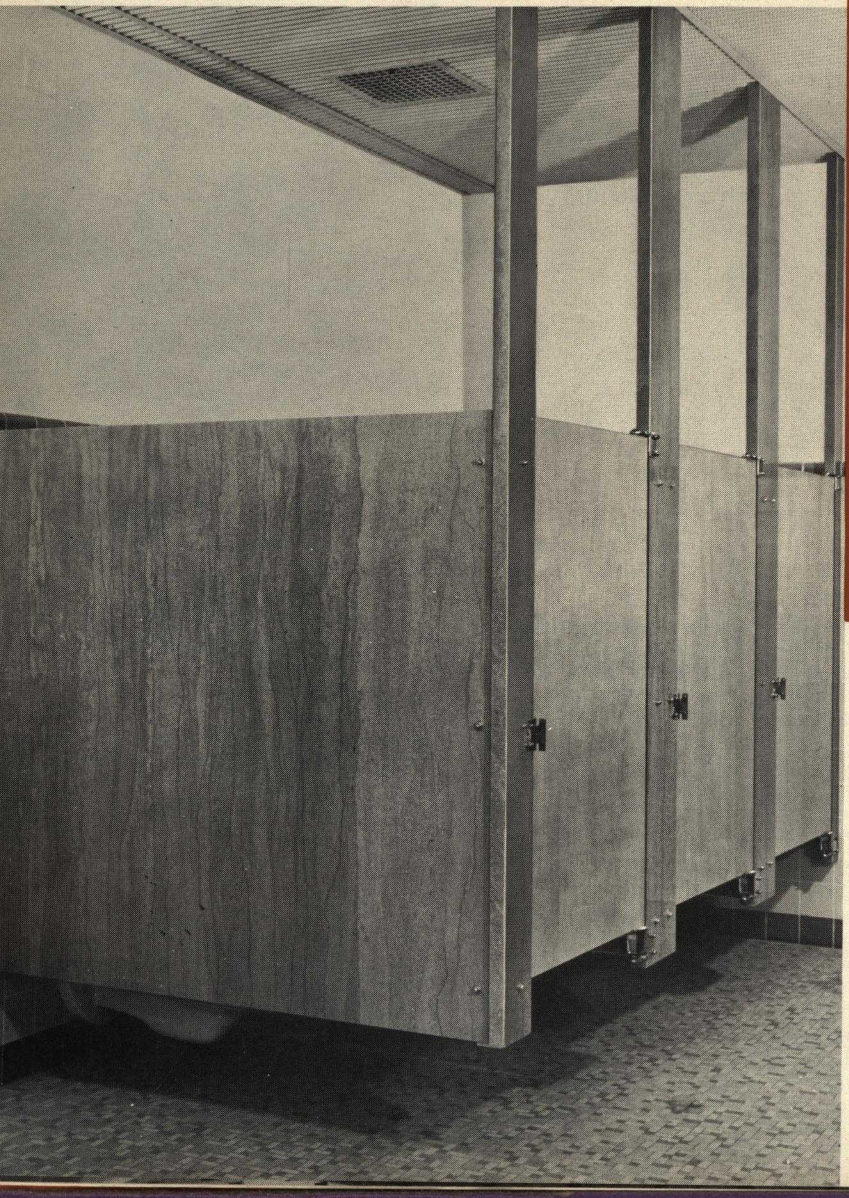
Compartments shall be fitted with combination keeper and bumper, gravity hinge, slide bar latch, coat hook with rubber tipped bumper, clip angles with cap nuts and brass rods, and paper holder. All hardware shall be of non-ferrous metal, chromium plated.

SPACEPACK

ceiling-hung toilet enclosures

Spacepack is a ceiling-hung marble toilet enclosure that is new in structural design (see details). Like Stallpack, it is prefabricated to standard size. Gleaming grey marble, chrome-plated hardware, and well-made metal doors are packaged and stocked at our plant, ready for immediate shipment.

Spacepack provides the ultimate in a toilet enclosure that is easily maintained. It leaves the floor clear of obstructions to make thorough cleaning a quick and easy job. What's more, the Class A Ozark Grey Veined marble used for stiles and partitions needs only an occasional washing with mild soap and water to stay shining clean and free from bacteria. This Class A marble won't rust or corrode, needs no paint or repair, and will give generations of dependable service. Even the hardware used for Spacepack is rustproof forever, being made entirely from non-ferrous metals.



detail drawings Scale: ½″ = 1′-0″

RECESSED ALUMINUM STRIPS ¼″ x ¾″ IN CROSS SECTION RUN FULL LENGTH OF STILES AND ARE PERMANENTLY ATTACHED TO MARBLE.

Scale: 1½″ = 1′-0″

SPECIFICATIONS

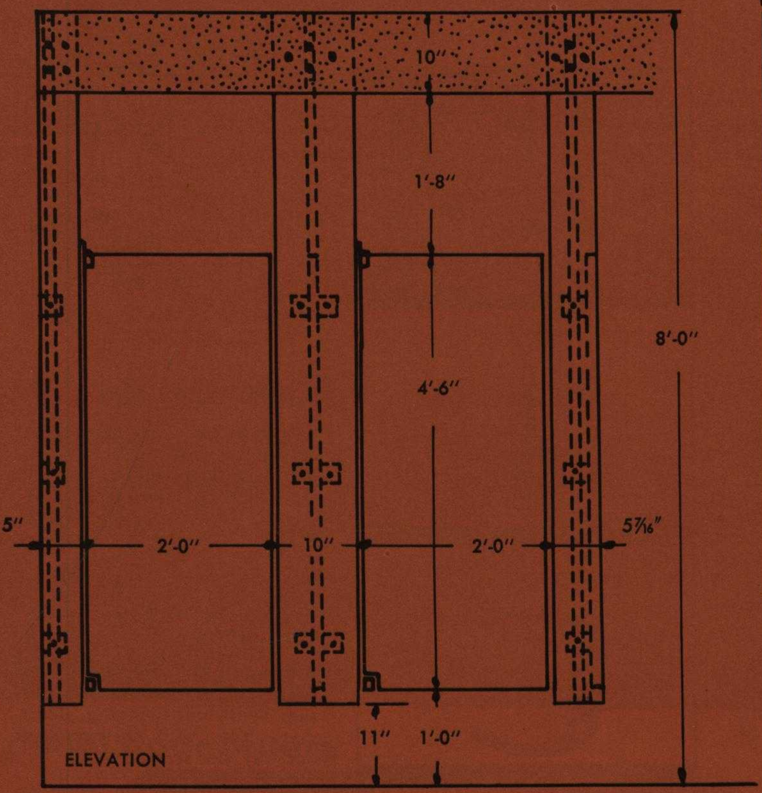
general

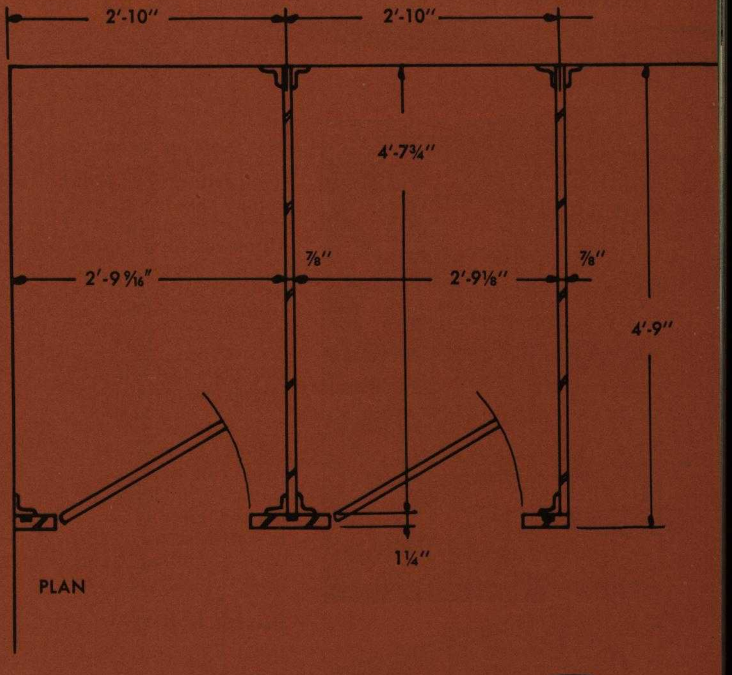
Toilet compartments shall be Spacepack ceiling-hung marble units as manufactured by the Carthage Marble Corporation, Carthage, Missouri. Toilet walls furnished by others must be perpendicular to the ceiling surface. Structural members in ceiling will be furnished by others.

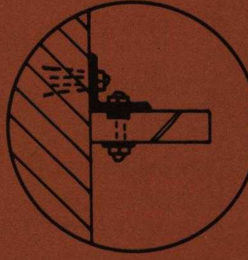
marble

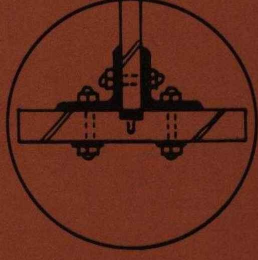
Stiles and partitions shall be of Ozark Grey Veined marble, polished and drilled for installation. Each stile shall be reinforced with an aluminum strip, ¾″x¼″ in cross section, and running the full length of the stile. The aluminum strip shall be recessed in the back of each stile and shall be permanently attached to the marble.

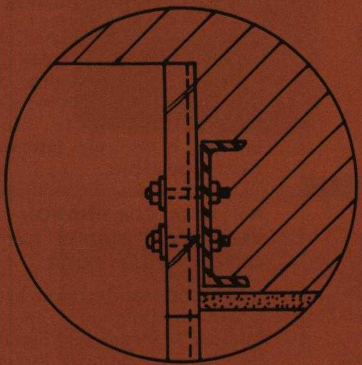
FOR CALCULATING METAL CHANNEL SIZE, WEIGHT OF TYPICAL CENTER STILE, PARTITION, DOOR AND HARDWARE IS 430 POUNDS.

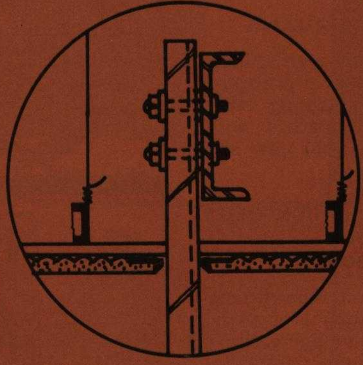


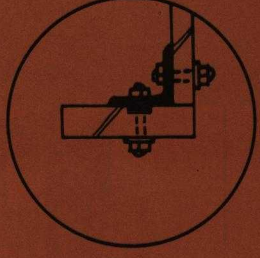












STILE DETAILS
No Scale

metal doors

Doors shall be flush construction of 22-gauge cold rolled steel, 1" thick, with fibre board cores cemented under pressure to the inner metal surfaces. Face plates of doors shall be bonded with interlocking trim moulding, mitered and welded at corners. Doors shall be galvanized, bonderized and coated with a rust-resistant synthetic primer followed by synthetic enamel baked at high temperatures.

wood doors (optional)

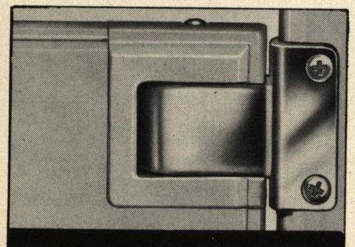
Birch Veneer Doors shall be chipboard solid core flush doors, 1" thick, as manufactured by the U. S. Plywood Corp. The extruded core shall be made from wood chips and resins. Edge strips shall be of ¾" hardwood bonded on the two long edges, top and bottom. Cross bands shall be any suitable hardwood not less than 1/12" and the birch face veneers shall be standard rotary cut, 1/24" thick. All face veneers shall be tapeless spliced and stroke sanded. Plies shall be bonded with resin by hot plate presses to meet tests for Type 1 (fully waterproof under CS 35-56 for hardwood plywood). Finish shall consist of one coat sanding sealer, two coats of high solid clear lacquer and one coat of clear satin lacquer.

hardware

Compartments shall be fitted with combination keeper and bumper, gravity hinge, slide bar latch, coat hook with rubber tipped bumper, clip angles with cap nuts and brass rods, and paper holder. All hardware shall be of non-ferrous metal, chromium plated.

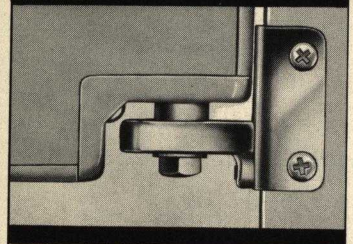
HARDWARE all non-ferrous metal chrome-plated

Hardware with the M designation is furnished with the metal door only. Hardware with the W designation is furnished with the wood door only. Hardware without letter designation is standard regardless of door type.



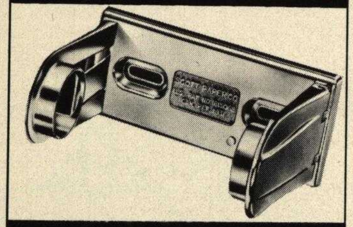
No. 206M UPPER HINGE

Non-ferrous, chrome-plated hinge has nylon and stainless steel moving parts. Die cast chromed cover provides flush surface over hinge, keeps out dirt, is sanitary. Tested over 2 million cycles with no measurable wear.



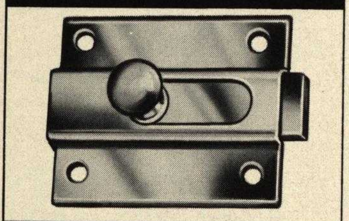
No. 205M CONCEALED LOWER HINGE

Non-ferrous chrome plated concealed hinge has opposing nylon cam action, stainless steel pintles. Suitable for in- and out-swinging doors. Adjustable to stand at any angle. Tested over 2 million cycles with no measurable wear.



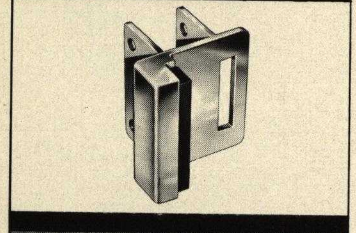
No. 964 ROLL TISSUE HOLDER

Rustproof, chrome-plated, die-cast holder is designed to dispense Tissue Service Roll. Hinged on one arm for quick, easy refilling. Tension device prevents spinning of the roll, assuring economical use of tissue.



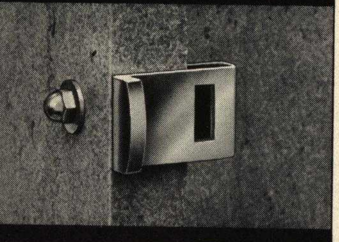
No. 305M SLIDE BAR LATCH

Rustproof, chrome-plated, brass slide bar-latch has a concealed spring plate eliminating rattle of latch bar. Attached with theft-resistant one-way slot screws.



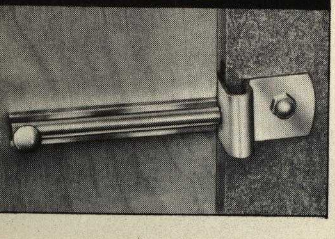
No. 306M COMBINATION KEEPER AND BUMPER FOR IN-SWINGING DOOR

Rustproof, non-ferrous, chrome-plated combination keeper and bumper for in-swinging doors has a rubber bumper insert for noiseless closing and is attached to marble mullion.



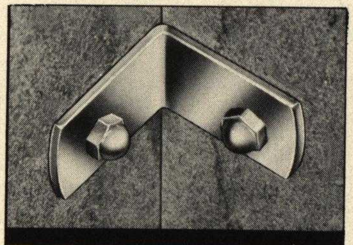
No. 308W STRIKE FOR IN-SWINGING DOOR

This rustproof, chrome-plated brass strike has vulcanized rubber bumper for noiseless closing and is easily attached to marble mullion.



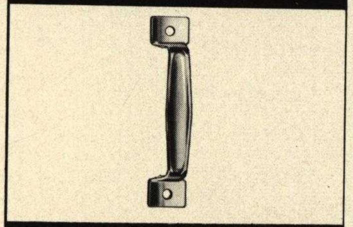
No. 307W LATCH FOR IN-SWINGING DOOR

This rustproof, chrome-plated brass latch consists of slide bolt and slide, is easily attached to the door. Simplicity of mechanism provides trouble-free operation.



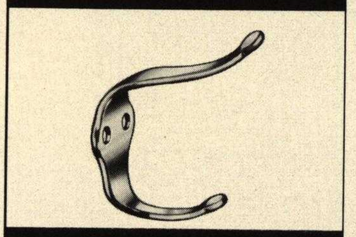
No. 503 CLIP ANGLE

Sturdy, rustproof, chrome-plated brass clip angle fits snugly against marble and provides a minimum of horizontal space to collect dirt. It is slotted to compensate for minute adjustments when out-of-line walls or floors are encountered, saves hours of setting time.



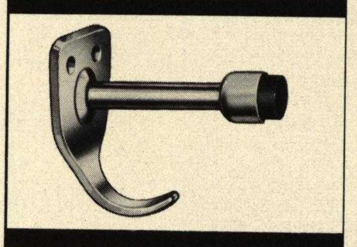
No. 406M DOOR PULL

Rustproof, chrome-plated brass door pull is used only with out-swinging doors and is attached with theft-resistant one-way slot screws.



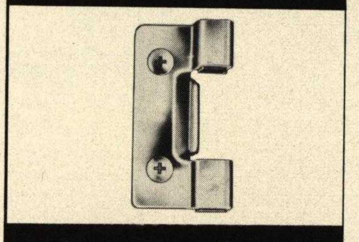
No. 604 TWO-PRONG COAT HOOK

Rustproof, chrome-plated, brass coat hook is used in combination with out-swinging doors. Attached with theft-resistant one-way slot screws.



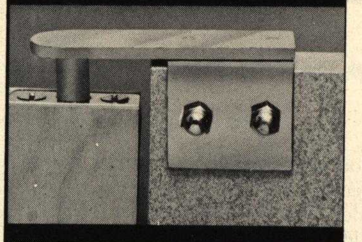
No. 603 COMBINATION COAT HOOK AND BUMPER

Rustproof, chrome-plated, brass combination coat hook and bumper for in-swinging doors is attached with theft-resistant one-way slot screws. Rubber bumper is securely fastened in its slot by a pin.



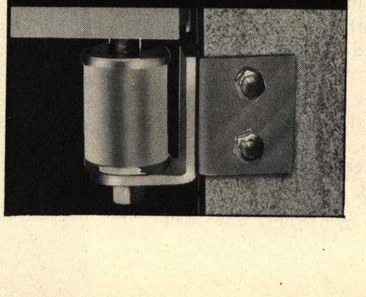
No. 309M COMBINATION KEEPER AND BUMPER FOR OUT-SWINGING DOOR

Rustproof, non-ferrous, chrome-plated combination keeper and bumper for out-swinging doors has a rubber bumper for noiseless closing and is attached to marble mullion.



No. 203W TOP-PLATE GRAVITY HINGE

This rustproof, chrome-plated brass hinge is of sturdy construction. It fits the top of the marble mullion and holds a pin in a metal slot on the top edge of the door.



No. 204W GRAVITY HINGE

This rustproof, chrome-plated brass gravity hinge works on a cam and can be adjusted to hold door open or shut by turning nut on bottom.

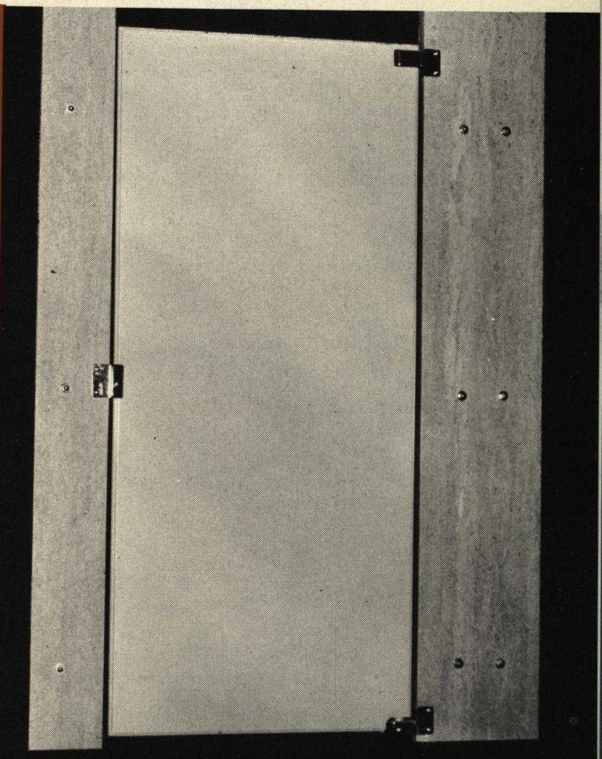
doors

METAL DOORS

Metal doors are now standard with Stallpack and Spacepack marble toilet enclosures. They will be available in two colors, turquoise or terra cotta. Metal doors are available only in the standard Stallpack size (2′-0″x4′-6″). Any departure from this size may utilize the Stallpack birch veneered solid-core wood door.

WOOD DOORS OPTIONAL

Wood doors are optional and can be furnished when a completely non-corrosive compartment is desired. This door is of solid core construction with birch veneer. See hardware Nos. 307W, 308W, 203W, and 204W for hardware used with this door. See sample specifications for a more complete description of the wood door.

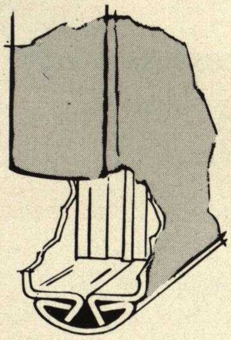


Because of the many variable and uncontrollable factors that affect the baking or firing process, and because responsible manufacturers of baking enamel and porcelain frit retain the privilege of a reasonable color variation, we are consequently unable to guarantee the exact matching of colors.

metal door colors

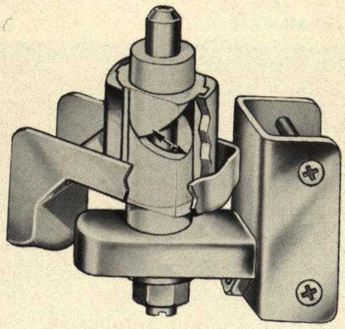
🟩 **42 Turquoise**

🟫 **13 Terra Cotta**



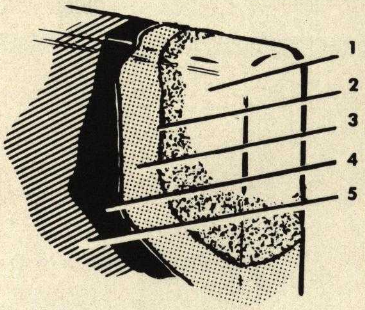
METAL DOOR CONSTRUCTION

Flush doors are made of two steel sheets spaced and insulated with laminated, corrugated fibre filler cemented to inner surfaces under pressure. Furthermore, each door is welded into a rigid one-piece unit, then bound with interlocking moulding welded at corners—in effect, double locked. Each edge is reinforced by three thicknesses of metal.



METAL DOOR HINGE

Rustproof, non-ferrous, chrome-plated concealed hinge for all metal doors. Opposing nylon cam action, stainess steel pintles. Suitable for in-swinging and out-swinging doors. Adjustable to stand at any desired angle. Tested over 2 million cycles with no measurable wear. Easy action —no slamming of door.



METAL DOOR FINISH

Baked enamel on bonderized galvanized steel.

1. Cold rolled steel.
2. Exceptionally smooth galvanized coating affords resistance to corrosion.
3. Bonderized for additional resistance and positive adhesion of enamel to metal.
4. Synthetic primer.
5. Enamel for highly protective surface coating and lustrous beauty.

information

See our general marble catalog in Sweet's Architectural File 13f/Ca with color plates of 16 low-cost domestic marbles, photographs of many domestic and foreign marble installations, and a complete descripion of our company and our reliable custom marble fabrication.

NOTES

- *It is the policy of Cutler Metal to constantly endeavor to improve the design and engineering of its Toilet Partitions. The company therefore reserves the right to institute improvements without notice.*

- *This catalog contains all information an architect would require for specifying quality metal compartments. For additional information, write Building Products Division, Cutler Metal Products Co., Camden 3, New Jersey.*

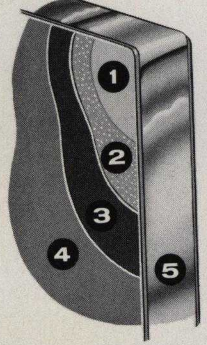
YOU GET THE FINEST WHEN YOU SPECIFY CUTLER TOILET COMPARTMENTS IN VITREOUS PORCELAIN ENAMEL OR BAKED ENAMEL

CUTLER QUALITY

As every architect knows, a product is only as good as the company behind it. Cutler Metal Products Company was founded and has been built upon the ideal of integrity in product design, workmanship, service. Over 40 years of engineering know-how goes into the planning, designing, and construction of Cutler Toilet Compartments. Result: Cutler Toilet Compartments are considered to be among the best made and most competitively priced units on the market today—and they're adaptable to all types of architectural and interior design. Two finishes are available—Vitreous Porcelain Enamel and Baked Enamel.

CUTLER VITREOUS PORCELAIN ENAMEL ON STEEL SPECIFICATION

Toilet Compartments Cambridge, Fordham, Overbrook (specify one), Shower, Dressing Enclosures and Hospital Cubicles shall be Cutler vitreous porcelain on steel complying with Porcelain Enamel Institute standards for acid-resisting architectural porcelain enamel as manufactured by Cutler Metal Products Co. Cutler porcelain enamel is available in the colors shown on page 3.



1 **Heavy gauge enameling iron.**

2 **Etched surface.**

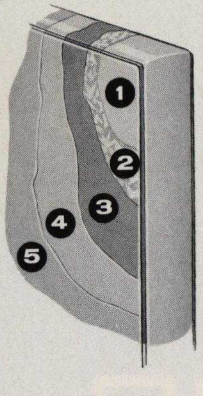
3 **Ground coat of porcelain.**

4 **Finish color coat of porcelain.**

5 **Stainless steel locking moulding.**

CUTLER BAKED ENAMEL FINISH
5-WAY PROTECTION Means Better Service — Longer Wear

Because metal compartments are subject to frequent washing and cleaning as well as to various acid and alkali conditions, they require better than average protection. All Cutler Compartments are 5-way protected against corrosion — guaranteeing extra service and longer wear.



1 **Heavy gauge stretcher-leveled furniture steel for strength and durability.**

2 **A Galvanized coat to prevent corrosion.**

3 **A Bonderized coat to insure adhesion of surface coatings to metal—extra corrosion protection.**

4 **A Primer coat to prepare the surface and provide the ideal base for the final finish.**

5 **Special double-coat acid and alkali-resistant vinyl alkyd enamel finish baked on at high temperature provides a protective surface of lustrous lasting beauty.**

This five-way protection increases the service and life-expectancy of Cutler Toilet Compartments at least three times.

OUTSTANDING CONSTRUCTION FEATURES

All Cutler Metal Compartments are precision-engineered for streamlined beauty, structural strength, and rapid easy assembly and installation. All edges are interlocked under tension with drawn metal molding. Result: easy cleaning, tamper-proof, and no exposed openings to inflict injury, catch dust, or hold dirt.

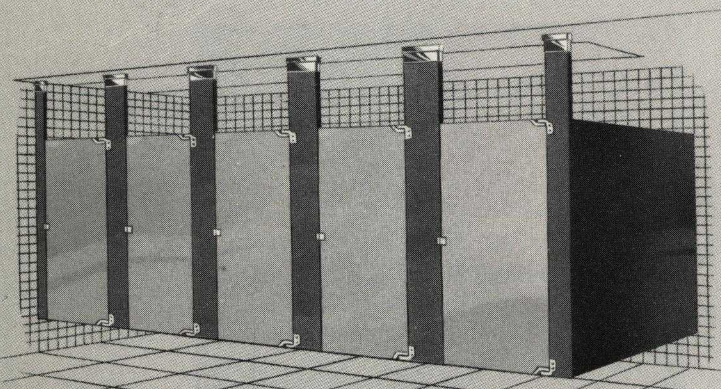
Standard Black No. 340, and Standard White No. 341 not shown

Acid and Alkali Resistant — Cutler Metal Compartments are available in a wide range of high gloss acid and alkali-resisting durable baked vinyl enamel finishes. They are not affected by cleaning fluids, soaps, acids, and salt spray and are completely resistant to *uric acid* and all standard commercial cleaning solvents.

Color Combinations — Any two color combinations desired are optional and may be selected at no extra charge. Combinations of three or more colors can be furnished at a slight additional charge.

Minimum Color Variation — Because of the nature of the baked enamel process, slight variations in color are sometimes unavoidable. Cutler Metal Products Company holds color variation to a minimum through the use of special color control techniques in production.

"CAMBRIDGE" CEILING-HUNG COMPARTMENTS



Cutler Ceiling-Hung partitions combine modern functional styling, the latest in engineering design for rigidity and ease of assembly, and the finest metal finishes for unsurpassed durability.

Modern functional styling — Cutler partitions are designed to keep pace with the modern trend in architecture. Complete simplicity, flush surfaces of doors and partitions, absence of fancy trim and mouldings reflect the refinement of modern thinking and modern design. Ceiling mounting brackets are completely hidden by a stainless steel shoe. Cut-out type gravity door hinges do not protrude above or below the doors.

Rigidity and ease of assembly — Heavy gauge bonderized-galvanized steel panels securely bonded to the honeycomb core and locked together along the edges provide partitions and doors of extreme rigidity. Equally rigid pilasters are mounted on building carrying members with anchor bolts. Heavy duty wall brackets secure the end panels to the finished wall. End panels are locked to the pilasters by stirrup brackets. Partitions are quickly and simply installed as the ceiling anchor bolts are adjustable to allow for variations in building construction.

Durability — Cutler doors, partitions and pilasters are treated for corrosion resistance and coated with baked vinyl finish for unsurpassed durability. Metal molding at the edges of panels provide protection against chipping, the focal point for rusting of steel panels.

SPECIFICATIONS

General — Toilet compartments shall be CAMBRIDGE, Ceiling-Hung as manufactured by the Cutler Metal Products Co. Doors and partitions shall be of flush construction. Structural members for hanging Cutler pilasters are not furnished.

Materials — Partitions shall be constructed of two sheets of #20 gauge, doors of #22 gauge, pilasters of #16 gauge stretcher leveled, bonderized-galvanized steel with honeycomb core cemented uniformly to the metal. Cores shall be honeycomb fiber board approximately 1″ thick for door panels and partitions and 1¼″ for stiles. Drawn metal molding shall be welded at the corners. Pilasters shall be constructed of two sheets of #16 gauge stretcher leveled bonderized-galvanized steel cemented to a honeycomb core and interlocked under tension to the entire length of the edges. Pilaster shoe fittings shall be stainless steel 3″ high.

Workmanship — Doors, partitions and pilasters shall be of flush construction with honeycomb core cemented under pressure to inner metal surfaces. Edges shall be interlocked under tension with drawn metal molding. Dividing partitions shall be anchored to pilaster with stirrup brackets.

Hardware and Fittings — All doors shall be equipped with a gravity hinge with concealed ball bearing roller, hinge brackets, keeper and bumper, and sliding door bolt. Hardware shall be non-ferrous chrome plated or stainless steel. All brackets shall be non-ferrous chrome plated.

Finish — All surfaces shall be cleaned and given a priming coat and a double high-temperature finishing coat of (specify color) special acid and alkali-resistant vinyl alkyd enamel baked on. For Vitreous Porcelain Enamel see page 2.

NOTE: *Toilet compartment units made of standard stretcher steel, without the extra corrosion protection of galvanizing and bonderizing are available at lower cost if desired.*

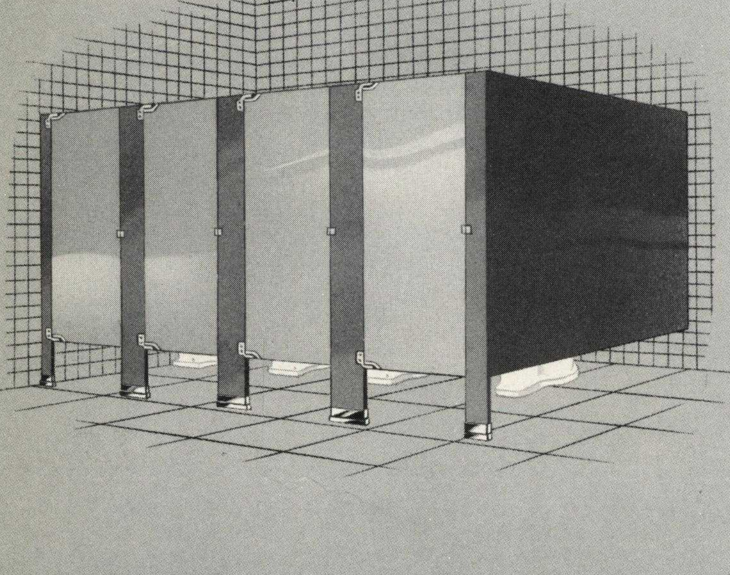
"FORDHAM" FLOOR-SUPPORTED COMPARTMENTS IN STANDARD AND JUNIOR SIZES



Cutler Floor-Supported partitions exhibit the same functional lines as the ceiling-hung partitions. Cutler partitions are readily adapted to any type of building design or construction.

Color Selection — Cutler partitions, available in high gloss vinyl alkyd baked enamels in black and white and 20 additional colors ranging from the light ivories to dark greens, reds and blues, provide a selection that will harmonize with the existing tiled or painted walls and floors of modern buildings.

Sanitary — Panels and pilasters are supported clear of the walls, simplifying cleansing. No dirt-catching corners or crevices to retain cleaning solutions. Vinyl alkyd baked enamel finish is highly resistant to acids and alkali cleaners, retaining its natural luster for the life of the partitions.

Junior size compartments — The versatility of Cutler partitions is exhibited in the smaller compartments for children. The Tiny Tim compartment has standard height pilasters and panels with special height doors as required to permit proper supervision of occupants. The Tom Thumb compartments are designed for non-standard lavatories and washrooms, accessories with heights adjusted to complement same.

SPECIFICATIONS

General — Toilet compartments shall be FORDHAM, Floor-Braced as manufactured by the Cutler Metal Products Co. Doors and partitions shall be of flush construction. There shall be no headrail. Solid sub-floor shall be furnished by others for anchoring Cutler pilasters.

Materials — Partitions shall be constructed of two sheets of #20 gauge stretcher leveled bonderized-galvanized steel with honeycomb core cemented uniformly to metal. Cores shall be honeycomb fiber board approximately 1" thick for door panels and partitions and 1¼" for stiles. Drawn metal molding shall be welded and ground smooth at the corners. Pilasters shall be constructed of two sheets of #16 gauge stretcher leveled bonderized-galvanized steel cemented to a honeycomb core and interlocked under tension to the entire length of the edges. Pilaster shoe fittings shall be stainless steel, 3" high.

Workmanship — Doors, partitions and pilasters shall be of flush construction with honeycomb core cemented under pressure to inner metal surfaces. Edges shall be interlocked under tension with drawn metal molding. Dividing partitions shall be anchored to pilaster with stirrup brackets.

Hardware and Fittings — All doors shall be equipped with a gravity hinge with concealed ball bearing roller, hinge brackets, keeper and bumper, coat hook and bumper and sliding door bolt. Hardware shall be non-ferrous chrome plated or stainless steel. All brackets shall be non-ferrous chrome plated.

Finish — All surfaces shall be cleaned and given a priming coat and a double high-temperature finishing coat of (specify color) special acid and alkali-resistant vinyl alkyd enamel baked on. For Vitreous Porcelain Enamel see page 2.

NOTE: *Toilet compartment units made of standard stretcher steel, without the extra corrosion protection of galvanizing and bonderizing are available at lower cost if desired.*

URINAL SCREEN
WALL HUNG TYPE
STANDARD SIZES: 18 X 42 OR 24 X 42

SPECIFICATION: Cutler Wall Hung Urinal Screens shall be of flush construction 1¼" thick. Screen shall be constructed of two sheets of #20 gauge stretcher level bonderized-galvanized steel, with honeycomb core cemented uniformly to the metal. Finish shall be Vitreous Porcelain Enamel or Baked Enamel (specify one).

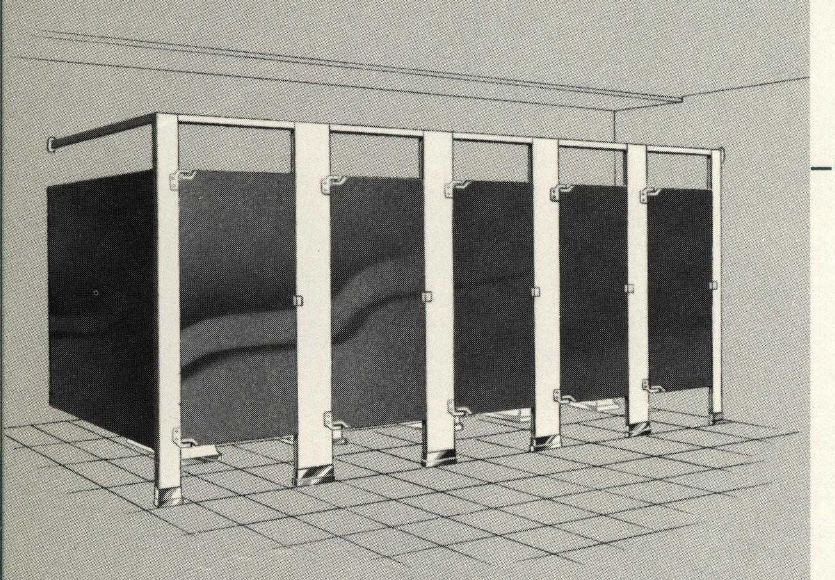
Screen panels shall be held together by drawn metal moulding, which shall be welded and ground smooth at the corners. The mounting flange of the unit shall be made of #12 gauge steel, which shall be an integral part of the panel. The mounting flange shall be reinforced with another piece of #12 gauge, all welded together for attachment of the screen to the wall.

NOTE: The screen is of a very rigid construction and must be mounted on a solid wall for best service. The method of installing to a masonry wall is shown on the illustration to the left. Other installations in stud and plaster walls, metal lath and plaster walls, hollow walls, or other similar construction, may require reinforcing members of either wood or steel. Consult home office for recommendations.

"OVERBROOK"
OVERHEAD-BRACED COMPARTMENTS

Overhead-Braced partitions round out the versatile line of Cutler compartments. Made up of the same rigid doors and partitions, overhead-braced Cutler compartments are adapted to a wide range of widths and depths. Economy is emphasized, with the same quality and workmanship as in other Cutler compartments.

- Pilasters constructed of #20 gauge steel with insulating core. Rigid flush door made of #22 gauge metal.
- All partitions corrosion treated and coated with vinyl alkyd enamel baked on.
- Pilasters accurately anchored to concrete floors.
- Compartment sizes:
  Width from center to center: 30", 32", 34" & 36"
  Depth: 57"
  Partition and door height: 58"
- Pilaster widths: 4", 5", 6", 8", 10" & 12"
- Door widths: 22", 24", 26", 28" & 30"
- Simple construction method permits easy and rapid assembly of pilaster to headrail.
- Recommended sizes are in accordance with the modular method of dimensioning, thereby simplifying the architect's designing and the field installation.



NOTE: *"Overbrook" compartments are available in two types, Flush type as shown above, and Panel type, not illustrated.* **PANEL TYPE** *is the same as* **FLUSH TYPE,** *except that dividing partition between compartments is single wall, #16 gauge, with formed reinforcing edges on all sides.*

SPECIFICATIONS

General — Toilet compartments shall be OVERBROOK, Overhead-Braced as manufactured by the Cutler Metal Products Co. Doors and partitions shall be flush construction, and stiles shall extend from floor to headrail.

Materials — Partitions and edge moldings shall be #20 gauge, doors #22 gauge, pilasters #20 gauge. All sheet stock shall be bonderized-galvanized stretcher leveled furniture steel. Cores shall be honeycomb fiber board approximately 1" thick for door panels and partitions and 1¼" for stiles. Stile shoe fittings shall be stainless steel 3" high. Headrail shall be 1" x 1½" tubing and shall thread through top of pilasters.

Workmanship — Doors, partitions and pilasters shall be flush construction with honeycomb core cemented under pressure to inner metal surfaces. Edges shall be interlocked under tension with drawn metal molding. Dividing partitions shall be anchored to stiles with stirrup brackets.

Hardware and Fittings — All doors shall be equipped with a gravity hinge with concealed ball bearing roller, hinge brackets, keeper and bumper, coat hook and bumper, and sliding door bolt. Hardware shall be non-ferrous chrome plated or stainless steel. All brackets shall be non-ferrous chrome plated.

Finish — All surfaces shall be cleaned and given a priming coat and a double high-temperature finishing coat of (specify color) special acid and alkali-resistant vinyl alkyd enamel baked on. For Vitreous Porcelain Enamel see page 2.

NOTE: *Toilet compartment units made of standard stretcher steel without the extra corrosion protection of galvanizing and bonderizing are available at lower cost if desired.*

CUTLER DUB-L-WALL SHOWER CABINET

WITH GENUINE TERRAZZO BASE

DESIGNED FOR LIFETIME SERVICE IN SCHOOLS, HOSPITALS, HOTELS, INDUSTRIAL PLANTS AND INSTITUTIONS —

The Cutler Dub-L-Wall Shower Cabinet is designed for heavy-duty installations where hard, steady day-in and day-out, year-in and year-out trouble-free service is required. Special 1″ thick double-wall construction of heavy gauge bonderized-galvanized steel with honeycomb core on side panels makes Dub-L-Wall the most solid, sturdy, durable shower cabinet you can buy.

Specially primed double high temperature finish coat of acid and alkali-resistant vinyl alkyd enamel baked on affords complete protection against corrosion. Genuine terrazzo base, with finely ground and smoothly polished surface, provides waterproof, rustproof, wearproof floor. Because the Cutler Dub-L-Wall Shower Cabinet is safety engineered throughout, functionally styled, easy to assemble and install, easy to keep clean, leakproof, rustproof and built to last a lifetime, it is ideal for use in schools, hospitals, hotels, motels, camps, lodges, industrial plants and institutions.

The Cutler Dub-L-Wall Shower Cabinet can be installed singly or in batteries of any desired arrangement or number. Special matching filler plates join and convert a series of shower stalls into a uniform single unit. White standard, decorator colors optional. Models also available in stainless steel. Sizes 36″ x 36″ and 32″ x 32″.

Cutler Dressing Compartments, harmonizing in over-all design and finish with Cutler Shower Cabinets, add the comfort, privacy and convenience needed for modern shower bathing at its finest.

SPECIFICATIONS

General — All shower cabinets shall be DUB-L-WALL, flush type as manufactured by Cutler Metal Products Co., Camden, New Jersey.

Materials And Workmanship — Walls shall be 1″ thick, made of two sheets of #20-gauge bonderized-galvanized stretcher level sheet steel. Side panels shall be a honeycomb core, cemented under pressure and bonded to the steel wall with a catalytic type adhesive. The two sides and bottom edges will be bound with interlocking moulding. The interlocking moulding shall be bonderized galvanized, all corners brazed and finished. The top frame shall be made of 1″ x 1½″ x 16-gauge tubular frame, welded into one-piece unit with all welding ground smooth. The curtain rod shall be fabricated of the same tubing and securely welded to the top frame.

Receptors — Shower floor shall be Biltmore Genuine Terrazzo Receptor as manufactured by Cutler Metal Products Co., Camden, N. J. Size shall be 36″ x 36″ or 32″ x 32″, with a 5″ high and 3″ wide curb running across the front edge. Receptors shall be made of black and white marble chips in a white cement and reinforced with wire. The drain shall be brass and cast integrally with receptor. Drain shall be equipped with a brass chrome-plated removable strainer, and shall be suitable for a 2″ inside caulked wastepipe.

Hardware And Fittings — Cabinets shall be equipped with 8-ounce white duck curtains with chrome-plated roller type curtain hooks, valves, shower head, and soap dish, when specified.

Finish — All surfaces shall be cleaned and given a priming coat and a double high-temperature finishing coat of (specify color) special acid and alkali-resistant vinyl alkyd enamel baked on. For Vitreous Porcelain Enamel see page 2.

ARCHITECT'S NOTE: *If desired, above units can be supplied in stainless steel.*

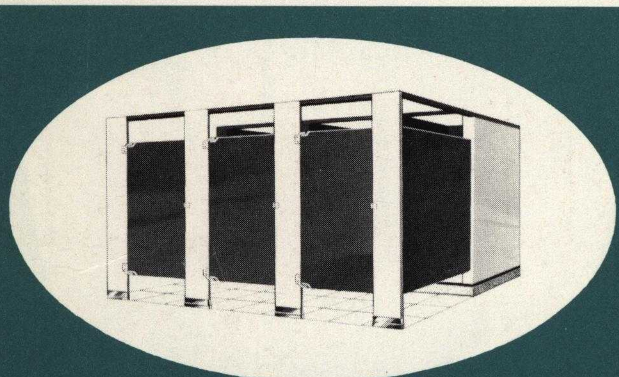
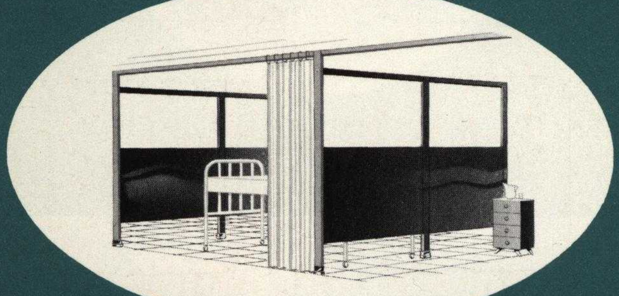
DRESSING ENCLOSURES
HOSPITAL CUBICLES





A complete line of Cutler Hospital Cubicles is available for the modern hospital. Constructed of heavy gauge steel, they are easy to assemble and install and can readily be rearranged whenever necessary. They provide privacy for ward patients, eliminate drafts, diminish noise, permit ample air circulation, and allow visibility of patients at all times. Flush type. Minimum maintenance costs. The Cutler Engineering Staff is at your service without obligation for consultation concerning your Hospital Cubicle layout problems.

DRESSING ENCLOSURES*

SPECIFICATIONS

General — Dressing compartments shall be FLUSH type as manufactured by Cutler Metal Products Co. Compartments shall have doors or curtains, and standard wooden seats and supports.

Materials — Partitions shall be constructed of two sheets of #20 gauge stretcher leveled steel, with honeycomb core cemented firmly to metal. Pilasters shall be #20 gauge. Doors when specified shall be regular FLUSH compartment type doors.

Workmanship — Pilasters when set in place shall be securely anchored to the floor with an adjustable floor saddle and locking bolt. The base of the pilaster and floor connection shall be concealed by a 3″ stainless steel shoe.

Hardware and Fittings — When doors are specified, coat hooks are to be included with door hardware. When curtains are specified, coat hooks shall be included with dividing partitions. Curtain hangers shall be rectangular snap type, chrome plated, with easy gliding rollers. All other fittings shall be of heavy gauge rust-resistant steel, enamel finish same as partitions.

Finish — All surfaces shall be cleaned and given a priming coat and a double high-temperature finishing coat of (specify color) special acid and alkali-resistant vinyl alkyd enamel baked on. For Vitreous Porcelain Enamel see page 2.

HOSPITAL CUBICLES

SPECIFICATIONS

General — Cubicle compartments shall be FLUSH type as manufactured by Cutler Metal Products Co. Glass (not furnished) shall be ¼″ thick plate glass.

Materials — Partitions shall be constructed of two sheets of #20 gauge stretcher leveled steel with honeycomb core cemented uniformly to the metal. Pilasters shall be #20 gauge.

Workmanship — Partition edges shall be bound and interlocked with drawn molding welded on the corners. Sheets shall be interlocked and welded to rear post, flanged and welded at front for flush fastening to pilasters. Pilasters when set in place shall be securely anchored to the floor with an adjustable floor saddle and locking bolt. The base of the pilaster and floor connection shall be concealed by a 3″ chrome plated cast shoe.

Fittings — Curtain hangars shall be sturdy rectangular chrome plated snap type with easy gliding rollers. Curtains shall be heavy plastic or duck. All fittings shall be heavy gauge rust resistant steel enamel finished same as partitions.

Finish — All surfaces shall be cleaned and given a priming coat and a double high-temperature finishing coat of (specify color) special acid and alkali-resistant vinyl alkyd enamel baked on. For Vitreous Porcelain Enamel see page 2.

*Cutler Dressing Enclosures, harmonizing in over-all design and finish with Cutler Shower Cabinets, add the comfort, privacy, and convenience needed for modern shower bathing at its finest. All panels are constructed of bonderized-galvanized heavy gauge steel, finished in your choice of color in lustrous high-temperature double-coat acid and alkali-resistant baked enamel to prevent rust. Designed for hard, steady, day-in and day-out, year-in and year-out use, easy to assemble and install, easy to keep clean, they are ideal for schools, factories, camps, hospitals, motels, hotels, air terminals, and every type of institutional, commercial or industrial installation.

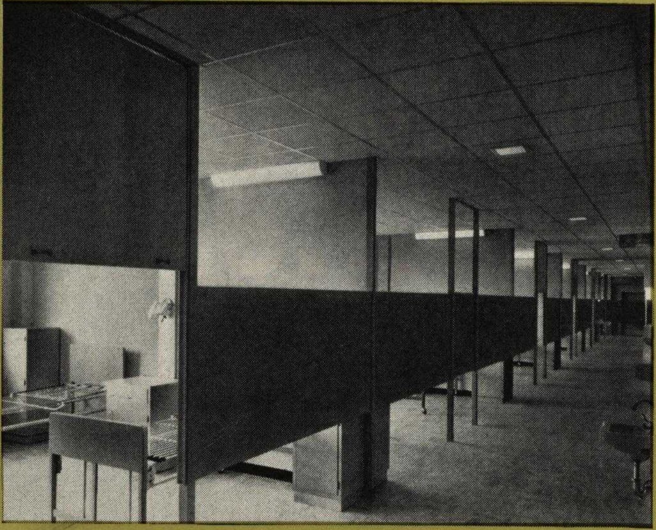
QUALITY METAL PRODUCTS SINCE 1893

Home Office, John Hancock Mutual Ins. Co., Boston, Mass. Cram & Ferguson, Archts. — Turner Construction Co., Contractor



State Tuberculosis Hospital, San Antonio, Texas — Phelps, Dewees & Simons, Archts. — J. J. Fritch, Contractor.

Company Background

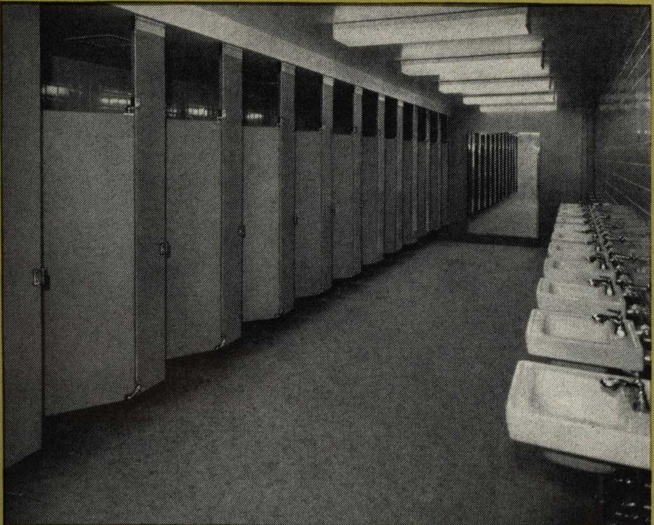
Since 1893 the Milwaukee Stamping Company has experienced continued growth in metal fabrication and have become quality leaders in many diversified markets including Ferrometal partitions, special stampings, builders and luggage hardware, metal furniture and shower cabinets. Since 1929 Ferrometal has been a potent factor in the progressive drive to establish ever higher standards of product acceptance. Many innovations now accepted as quality standards are attributable to the resourcefulness and ingenuity of Ferrometal engineering. Newer and improved techniques for an ever better product are constantly being originated, studied, tested and employed.

large scale quality production

An associate of a multi plant organization, the Milwaukee Stamping Company occupies over 275,000 square feet of manufacturing area. Extensive facilities, include a complete tool and die shop, punch press capacity to 250 tons, shears, press brakes, automatic screw machines, acetylene, arc and spot welding, light machining, assembly, complete plating, polishing and finish painting systems. Manned by employees of many years tenure, quality control is further achieved by a rigid inspection system.

large stock means rapid service

Along with added productive area Ferrometal has increased sharply upward its inventories of raw materials to assure a constant flow of partitions to



Mid America Home Office, Prudential Life Ins. Co., Chicago, Ill. Naess & Murphy, Archts.; George A. Fuller Co., Contr.

Air Terminal, General Mitchell Field, Milwaukee, Wisconsin
John Messmer, Superintendent of Buildings
Milwaukee County Architect

its many users. To provide even more efficient and prompt service large stocks of fabricated partitions, doors and pilasters in standard sizes are carried constantly. Emergency shipments of standard size parts can be effected within a matter of days.

large facilities

To satisfy the demand for its product Ferrometal has recently availed itself of the added production of a new facility designed exclusively for the most modern and efficient production of toilet partitions. Located in the Chicago area, prompt service can be provided everywhere through Ferrometal's over 100 local representatives.

endorsements

The stature of Ferrometal in the building industry testifies to the confidence placed in it by owners, architects and contractors everywhere on all types and sizes of projects ranging from service stations to the largest of monumental buildings including factories, utilities, schools, universities, hospitals, transportation terminals, religious, office and governmental buildings. Further attesting to Ferrometal engineering capabilities and product quality are the special applications use as ward room dividers, shipboard use and simplified office subdivisions. A representative list of projects and illustrations of product use in some better known buildings are shown here.

Product Features

- **Stainless Steel Hardware**
  For ultimate strength, life-time use and beauty.
- **Concealed Matchless Gravity Hinge**
  For trouble free operation, continuous alignment.
- **Concealed Throw Bolt**
  Cam actuated concealed latching mechanism promotes flush appearance — prevents vandalism and theft.
- **Synthetic Enamel**
  New acrylic finish for sensational resistance to corrosion and abrasion.
- **Porcelain Enamel**
  An inert coating for resistance to organic solvents — superior hardness.
- **Theft Proof Screws**
  Furnished for latches and coat hooks to prevent pilferage.
- **Through Bolted Hardware**
  Eliminates sheet metal screw pull-out — provides greater strength.
- **Pre-drilled Whenever Possible**
  Assures fast, efficient field erection — and per manufacturer's intent.
- **Sub-Floor Anchor Channels**
  Furnished when specified for floor fill conditions when using type FT.
- **Ceiling Plaster Inset Sleeves**
  Provided to assure rigid stud anchorage and prevent plaster cracking.

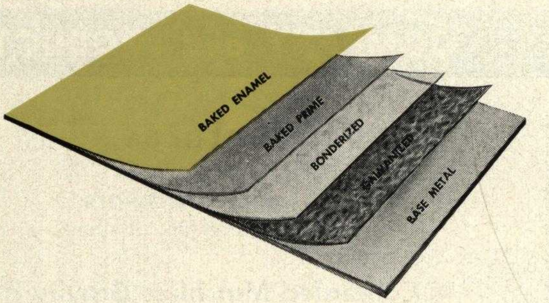
Synthetic Enamel



Once again, Ferrometal, who introduced Polyclutch enamel to the industry, has taken a long stride forward, and another first in providing a vastly superior finish on its product. Synthetic enamel finish based on entirely new and unique thermosetting acrylic resins. Hardness and toughness approaching that of porcelain enamel combined with flexibility assuring non-chipping characteristics plus extremely high resistance to acids and alkalies are some of the advantages of this sensational finish. This finish has been fully laboratory and field tested commercially in the past year. Although higher in cost than alkyd enamels, Ferrometal will offer this superior finish over galvanized bonderized steel as its standard Tufbond finish.

Test Results

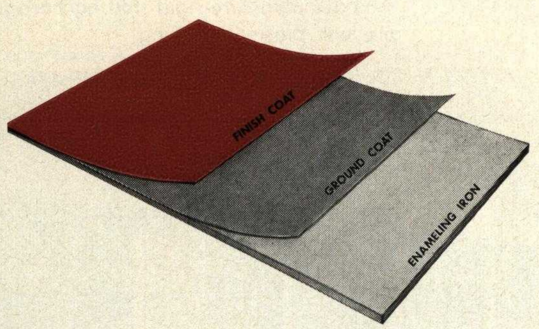
The following laboratory tests indicate why Ferrometal believes its finishes to be the ultimate in performance and application to use in modern washroom partitions. Samples used were bonderized steel with 1.5 mils thickness of Synthetic enamel baked on at 350 degrees F. for 30 minutes.

Hardness: a) Seward Rocker	40 to 59
b) Pencil (no mar showing)	6 H to 8 H
Impact: (without break)	30 inch lbs.
Abrasion Resistance:	
a) Taber CS 10 wheel 1000 gr. wt.	8.58 mg. loss per 100 revolutions
Detergent Resistance:	
2% ALL 1% Salt — 140 Degrees	300 hours
Stain Resistance:	
Mustard	Excellent
Lipstick	Excellent
Oil Soluble Dye	Excellent
Humidity:	
Saturated Humidity, 100 Deg. F.	1200 hours

Alkyd Enamel

Time tested melamine modified alkyd enamels will continue to be used over cold rolled furniture and baked on prime coat for Ferrometals Tufkote finish.

PORCELUX - Porcelain Enamel



To satisfy the demand of its customers, Ferrometal now introduces its new Porcelux enamel finish. A vitreous porcelain coating over enameling iron, this finish is glass hard and is recommended where superior abrasion resistance warrants the increased expenditure for its selection on toilet partitions. Of particular advantage also is its resistance to commercial solvents because of its inorganic nature. Porcelux finish as furnished by Ferrometal will meet the requirements of the Porcelain Enamel Institute for acid resisting architectural procelain enamel and will also meet the following test results.

Test Results:

Hardness — Milled edge of coin	No scratch
Abrasion Resistance Taber abrader	012 mg. loss per 500 revolutions
Alkaline Resistance:	
10% caustic soda	6 hrs.
10% ammonioum hydroxide	6 hrs.
Acids (slight dulling permissible)	
10% sulphuric	6 hrs.
10% nitric	6 hrs.
10% acetic	6 hrs.

Ferrometal

COLOR SELECTIONS

Harmony in Color

These color shades have been carefully selected to provide you with a wide variation of choice in pleasing blends and contrasts to properly suit your color scheme. All shades plus black and white are available in Porcelain and Synthetic finishes. Because of greater depth and gloss, porcelain finishes will contrast with Synthetic finish. Because of uncontrollable factors in baking and firing processes and privileges of reasonable color variations by responsible paint and frit manufacturers, we cannot guarantee exact color match. Two colors per installation may be chosen from this chart at no extra charge. Selections of colors other than shown can be made available at extra cost.

Ceiling Hung Partitions Type CH

Designed to meet the highest contemporary standards *Ceiling Hung* partitions by FERROMETAL will help achieve beauty and economy of maintenance in today's ultra-modern washrooms. Ruggedly constructed—fabricated of galvanized bonderized furniture steel or porcelain enameling iron—finished with acrylic based Synthetic enamel (See page 4) or porcelain enamel — furnished with heavy gauge wrought 18-8 stainless steel hardware, this partition is engineered to withstand rigorous toilet room usage. Wide color ranges available in several finishes coupled with lustrous satin-polished stainless steel hardware, including the proven MATCHLESS gravity concealed hinge and inset top pivot, help impart a truly modern accent to attractive washroom appearance. Smooth rounded corners with edges locked and sealed with flush surfaces throughout, with partitions and pilasters supported clear of walls eliminate dirt accumulations. Suspended from drop ceiling with no floor obstructions, and used with wall hung fixtures throughout, floor cleansing is quickly, effectively and economically accomplished. Urinal screens where required are also wall hung with extra heavy stirrup brackets or continuous back plate wall anchor dependent upon size and specified preference. This type construction is ideal for buildings wherever top quality and maintenance savings of 25 to 30% (per building superintendent survey) are deciding factors in product selection.

CEILING HUNG PARTITIONS

architects' specifications

Toilet compartments shall be FERROMETAL type CH as manufactured by the Milwaukee Stamping Company, Chicago, Illinois.

TUFBOND (Galvanized Bonderized Steel, Synthetic Enamel Finish)

DIVIDING PARTITIONS: Dividing partitions shall be not less than 1" thick, made of two sheets of 20 gauge steel stretcher leveled zinc-coated and bonderized. Sound deadening core shall be cemented with rubber base adhesive and assembled under pressure. Edges of sheets shall be interlocked along entire outside edge sealing same into one continuous smooth surface. Corner joints to be mitered, brazed and ground smooth.

PILASTERS: To be 1¼" thick, made of 16 gauge steel sheets zinc-coated and bonderized assembled with sound deadening core, otherwise similar to dividing panels. Pilaster to have tapped reinforcements for machine screw application of stirrup bracket connection. Pilasters to have adjustable ceiling anchor with leveling device, plaster sleeve spacers and locking nuts to firmly secure pilaster.

DOORS: All doors shall be 22 gauge steel otherwise same construction as divider partitions. Internal welded box reinforcements shall be provided for hinges and latches. Hinge body to be concealed in door. Bottom edge of door to align with front pilaster when door is in closed position.

FINISH: All surfaces to be thoroughly degreased. Synthetic acrylic based thermosetting enamel to be sprayed on at a minimum thickness of 1½ mils and baked at 300 degrees Fahrenheit for thirty minutes.

HARDWARE AND FITTINGS: All doors to be provided with concealed Matchless gravity hinge adjustable from outside to provide universal rest location. Furnish inset top pivot assembly, concealed turn bolt or throw latch, clamp strike and keeper, hinge brackets, coat hook and bumper. All hardware and cap shoes to be wrought 18-8 stainless steel, exposed parts to be satin polished. All hardware to be thru bolted except coat hook to be applied with theft proof screws. Enameled wrought steel stirrup brackets to be provided for wall and pilaster connections, anodized extruded aluminum available as optional extra.

PORCELUX (Enameling Iron, Porcelain Enamel Finish)

DIVIDING PARTITIONS AND DOORS: Shall be not less than one inch thick made of 2 sheets of 18 gauge enameling iron pan formed and assembled to sound deadening core. Edges of facing sheets shall be welded to provide rigid slab construction and concealed along entire outside edge with polished stainless steel locking moulding mitred, welded, ground smooth and polished at corner joints. Internal reinforcements shall be provided for all door hardware. Hinge body to be concealed within door. Bottom edge of door to align with front pilaster when in closed position.

PILASTERS: To be 1¼" thick otherwise same as dividing partitions and doors. Pilasters to have tapped reinforcement for machine screw application of stirrup bracket connections. Pilasters to have adjustable ceiling anchor with leveling device, plaster sleeve spacers, and locking nuts to firmly secure pilaster.

FINISH: All facing sheets to be coated on both sides with one ground coat of porcelain enamel. Exposed faces to have finish coat of porcelain enamel in manufacturers standard color selections. Coatings are to be fired separately. Final finish to meet the standards of the architectural porcelain enamel as established by Porcelain Enamel Institute.

HARDWARE AND FITTINGS: Same as under TUFBOND except stirrup brackets anodized extruded aluminum.

Flush Top Partitions Type FT

For those fine buildings where the initial cost of overhead support is not desired, Flush Top partitions by FERROMETAL will provide the same modern addition to washroom beauty as is true with Ceiling Hung (type CH). Fabricated in galvanized bonderized steel with Synthetic Enamel finish or enameling iron with porcelain enamel finish, made similarly in all respects to type CH with the exception of floor anchored instead of ceiling supported pilaster, this design has the same sturdy construction as Ceiling Hung with greater application. Wide color ranges are now available in two different types of finishes, (e.g.) the new sensationally uric acid, alkaline and humidity resistant Synthetic enamel over zinc coated steel or high hard gloss porcelain enamel — and for the low cost budget, alkyd enamel over cold rolled steel (not recommended for top performance). Lustrous satin-polished 18-8 stainless steel hardware including the proven MATCHLESS concealed gravity hinge help complement washroom beauty. Doors and pilasters are in the same horizontal plane eliminating headrail and adding to the attractiveness of the installation. Smooth rounded corners with edges locked and sealed, flush surfaces throughout with partitions supported clear of walls allow for easy cleaning and maintenance of sanitary conditions. Recommended for public buildings, offices, terminals, schools, etc. See accompanying details for recommended use and installation.

Stile To Headrail Partitions Type SHR Flush

For wider product application than possible in Types CH & FT, and medium price range is desirable, *Stile to Headrail Flush* (type SHR Flush) partitions by FERROMETAL will render a rigid installation harmonizing attractively with modern washroom interiors. Overhead rail allows for solidly braced installations where pilaster is in same vertical plane as divider. This construction is particularly recommended for built up showers, dressing rooms, entry screens and long runs as in recesses exceeding 60 inches. While overhead bracing allows for certain economy of construction, generally, the same attractive appearance is kept with smooth rounded edges and flush surfaces throughout. Finishes available include — Synthetic, a highly acid and alkaline resistant acrylic based enamel over galvanized bonderized steel — Porcelain enamel, an extremely abrasion resistant coating of long life and beauty — and alkyd enamel, a serviceable finish over cold rolled furniture steel. This type construction is also furnished with satin-polished stainless steel hardware including the MATCHLESS concealed gravity hinge and top inset pivot. Recommended for use anywhere; this type serves especially well where the most severe performance is required.

Toilet compartments shall be FERROMETAL type SHR Flush as Manufactured by the Milwaukee Stamping Company, Chicago, Illinois.

TUFBOND (Galvanized Bonderized Steel) or TUFKOTE (Cold Rolled Steel)

DIVIDING PARTITIONS: Dividing partitions shall be not less than 1" thick, made of two sheets of 20 gauge stretcher leveled cold rolled (or zinc coated bonderized) steel assembled under pressure to sound deadening core with rubber based adhesive. Edges of sheets shall be interlocked along entire outside edge with corner joints to be mitred, brazed and ground smooth.

PILASTERS: To be 1¼" thick made of 20 gauge steel otherwise same as dividing partitions. 2" pilasters to be 16 gauge tubing without cores. Pilasters to have adjustable floor anchors to firmly secure pilaster.

HEADRAIL: To be 1¼" x ⅞" 16 gauge tubing to fasten to top of pilaster with wrought steel channel secured at top, front and back with screws.

DOORS: All doors to be 22 gauge steel otherwise same construction as dividing partitions. Internal welded box reinforcements shall be provided for hinges and latches. Hinge body to be concealed in door.

FINISH: All surfaces to be thoroughly degreased. (TUFBOND only) acrylic based thermosetting enamel to be sprayed on at a minimum thickness of 1½ mils and baked at 300° for 30 minutes. (TUFKOTE only) primer and alkyd synthetic enamel to be applied in successive coats and baked on separately.

HARDWARE AND FITTINGS: All doors to be provided with concealed Matchless gravity hinge adjustable from outside to provide universal rest location. Furnish inset top pivot assembly, concealed turn bolt or throw-latch, keeper and bumper, hinge brackets, coat hook and bumper. All hardware and floor shoes to be wrought 18-8 stainless steel, exposed parts to be satin polished. All hardware to be thru bolted except coat hook to be applied with theft proof screws. Enameled wrought steel brackets to be provided for wall and pilaster connections, anodized extruded aluminum available as optional extra.

PORCELUX (Enameling Iron, Porcelain Enamel Finish)

DIVIDING PARTITIONS AND DOORS: Shall not be less than 1" thick, made of 2 sheets of 18 gauge enameling iron pan formed and assembled to sound deadening core. Edges of facing sheets shall be welded to provide rigid slab construction and concealed along entire outside edge with polished stainless steel locking moulding, mitred, welded, and polished smooth at corner joints. Internal reinforcements shall be provided for all door hardware. Hinge body to be concealed within door.

PILASTERS: To be 1¼" thick otherwise same as dividing partitions and doors. Pilasters to have tapped reinforcements for machine screw application of stirrup bracket connections. Pilasters to have adjustable floor anchor with leveling device, anchor studs and locking nuts to firmly secure pilasters.

FINISH: All facing sheets to be coated on both sides with one ground coat of porcelain enamel. Exposed faces to have finish coat of porcelain enamel in manufacturers standard color selections. Coatings are to be fired separately. Final finish to meet the standards of architectural porcelain enamel as established by the Porcelain Enamel Institute.

HARDWARE AND FITTINGS: Same as under TUFBOND or TUFKOTE except stirrup brackets anodized extruded aluminum.

Econometal Stile To Headrail Partitions

For those buildings where extreme economy requires the lowest cost on all materials, Milwaukee Stamping Company now introduces a new economy flush type partition to furnish the answer on toilet partition requirements. The purchase of new forming equipment permits fabricating methods and designs which achieve true economy with relatively small loss of quality compared to the high standards of the Ferrometal designs and constructions. This new partition is priced lower than single sheet panel types of construction permitting elimination of that product type and its objectionable features such as noisy sound transmission and the accumulation of dirt on moulding reveals. In appearance much of the SHR flush construction is retained. Sound deadened core and solid slab assembly provide excellent rigidity. Hardware including the MATCHLESS completely gravity operated concealed hinge is of heavy gauge wrought 18-8 stainless steel satin polished finish. This type construction is available in Tufbond, galvanized bonderized steel with synthetic enamel finish or Tufkote, cold rolled furniture steel with alkyd enamel. Porcelain enamel finish is *NOT* offered in this type in consideration of the intent of extreme economy in design.

GENERAL: Toilet compartments shall be ECONOMETAL as manufactured by the Milwaukee Stamping Company, Chicago, Illinois.

DIVIDING PARTITIONS: Dividing partitions shall be not less than 1" thick, made of two sheets of stretcher levelled cold rolled (or zinc coated bonderized) steel assembled under pressure to sound deadened core with rubber base adhesive. Edges of panel shall be formed to interlock with each other. Corner joints to be welded and ground smooth.

PILASTERS: To be 1¼" thick made of two sheets of cold rolled (or galvanized bonderized) stretcher levelled furniture steel assembled to sound deadening core under pressure. Edge of panel shall be formed to interlock with each other. Corner joints to be welded.

HEADRAIL: To be 1 x 1½", 18 gauge tubing inserted into and attached to pilaster. Headrail to be continuous across the fronts of compartments and over end panels.

DOORS: All doors shall be 22 gauge steel, one inch thick flush construction otherwise similar to pilaster. Internal welded box reinforcements shall be provided for all door hardware. Inset top pivot to be provided for and hinge body to be concealed in door.

FINISH: All surfaces to be thoroughly degreased. Primer and urea melamine alkyd enamel to be applied in successive coats and baked on separately at 300° Fahrenheit.

HARDWARE AND FITTINGS: All doors to be provided with concealed Matchless gravity hinge adjustable from outside to provide universal rest location. Furnish inset top pivot assembly, throw latch, keeper and bumper, hinge brackets, coat hook and bumper. All hardware and floor shoes to be wrought 18-8 stainless steel, exposed parts to be satin polished. Latches and coat hooks to be applied with theft proof screws. CONSTRUCTION DETAILS

Ferrolux Shower Cabinet

An exceptionally rugged, self-contained shower unit with high, inherent structural strength, the Ferrolux shower cabinet yet possesses an extremely attractive and modern appearance. Insulated and sound-deadened sidewalls eliminate objectionable drumming so apparent in single sheet type of cabinets. Walls are fabricated of galvanized bonderized steel facing sheets cemented to a phenolic resin impregnated core. Back corner joints are locked rigidly by six hooks in tension per side; top frame of 16 gauge steel tubing secured to sidewalls assures a completely integral unit. Receptor is 6" high and 3" thick at wall connection and made of reinforced Terrazzo concrete in black and white. Inside face is acid etched for slip proofing while outside faces and threshold are polished; cast in drain for caulking to 2" pipe is provided with removable chrome plated strainer. Assembly and anchorage of sidewalls to receptor by means of rabbetted construction, indicated in detail opposite, assures a completely leak-proof joint. Sidewalls and top frame are finished with sensationally rust, alkali, and acid resisting Duracron enamel finish in colors as selected. Jamb trim is polished stainless steel. Furnished as standard with curtain rod, this unit can be provided with a glass shower door at optional extra. For complete information write Home Office or contact our local representative. Shipped knockdown and readily assembled in a completely leak-proof manner, unit is conveniently adopted to battery assembly in conjunction with matching Ferrometal SHR dressing stalls.

FERROMETAL PORCELUX

Vitreous Porcelain Enamel Finish

For the ultimate washroom appearance and life specify Ferrometal "Porcelux" vitreous porcelain enamel finish. The advantages are many — permanent fresh colors, glass hard abrasion resistance coupled with damp cloth cleansing eliminates damage from lipstick and pencil vandalism, acid resistance overcomes uric acid corrosion, completely sanitary surfaces are bacteria free and impervious to odor absorption.

The construction details shown below illustrate the superiority of Ferrometal design application of this superb finish. Solid slab construction is achieved by use of heavier gauge sheets than used on synthetic enamel types with complete periphery of panel welded on 12" centers. Continuous hinge alignment is secured by fixture positioned welded box channel reinforcements. Homogenous trim finish appearance is attained by matching materials and finishes of satin polished stainless steel cover mouldings, headrails and Ferrometal's stainless steel hardware.

Other high performing materials such as vinyl coated steel and satin polished stainless steel are also made available by Ferrometal. Write for specification detail or consult our local representative.

NOTHING can equal Stainless Steel where HARDWARE gets HARD WEAR

No other material can match stainless steel in its combination of desirable physical properties. Extremely high tensile strength, hard outside, tough inside, solid and strong clear through, stainless steel is almost indestructible, not easily scratched, gouged or otherwise marred. Lustrous satin polished surfaces are non-tarnishing, non-chipping, permanent and easily maintained.

Ferrometal employs the use of stainless steel in all its hinging and latching mechanisms and was first and foremost in adapting this excellent material to lavatory hardware design. Heavy gauge wrought parts, smooth clean lines and lustrous polished finishes testify to over 60 years of experience in design, development, fabrication, assembly and finishing of builders and lavatory hardware for the industry.

Physical Features

Compare these advantages:

Physical features
tensile strength Psi — 125,000
modulus of elasticity lbs./in^{2}x10^6 - 29.0
hardness, Rockwell — B90 max.
impact valves, Izod, ft.-lb. - 89 min.

Corrosion resistance	
uric acid, conc.	unaffected
soaps	unaffected
ammonium hydroxide	unaffected
sodium hydroxide	unaffected

Concealed Matchless Gravity Hinge

Designed and developed by Ferrometal to satisfy a demand for superior hardware to withstand the abuse and rough usage experienced in washrooms, the concealed Matchless gravity hinge provides the ultimate in its assurance of continuous smooth operation and resistance to wear and destruction. Coupled with an inset top pivot with 3 point support, heavy gauge reinforcements, welded integrally with facing sheets of door, the matchless concealed gravity hinge assures many years of continuous use. Graphite impregnated bronze bushings and roller bearing ball race guarantee ease of operation. Field and laboratory tested over a number of years of experience.

Advantages

Superior strength

Attached to inside of door face — not to corner edge, structurally becoming part of door itself.

Easy to attach

Hinge is factory assembled into door, so that door needs only to be placed into bracket.

Trouble free operation

Universal gravity type hinge permits easy adjustment from outside of door in place.

Continuous alignment

Hinge and rigid steel door, built into one integral unit will prevent binding, bending or warping.

No loss of hinges

Factory installation of hinges in doors assures no misplacement of hinges or improper installations of same.

Easier maintenance

Cleaning is faster, more thorough—hinge is protected against vandalism and moisture.

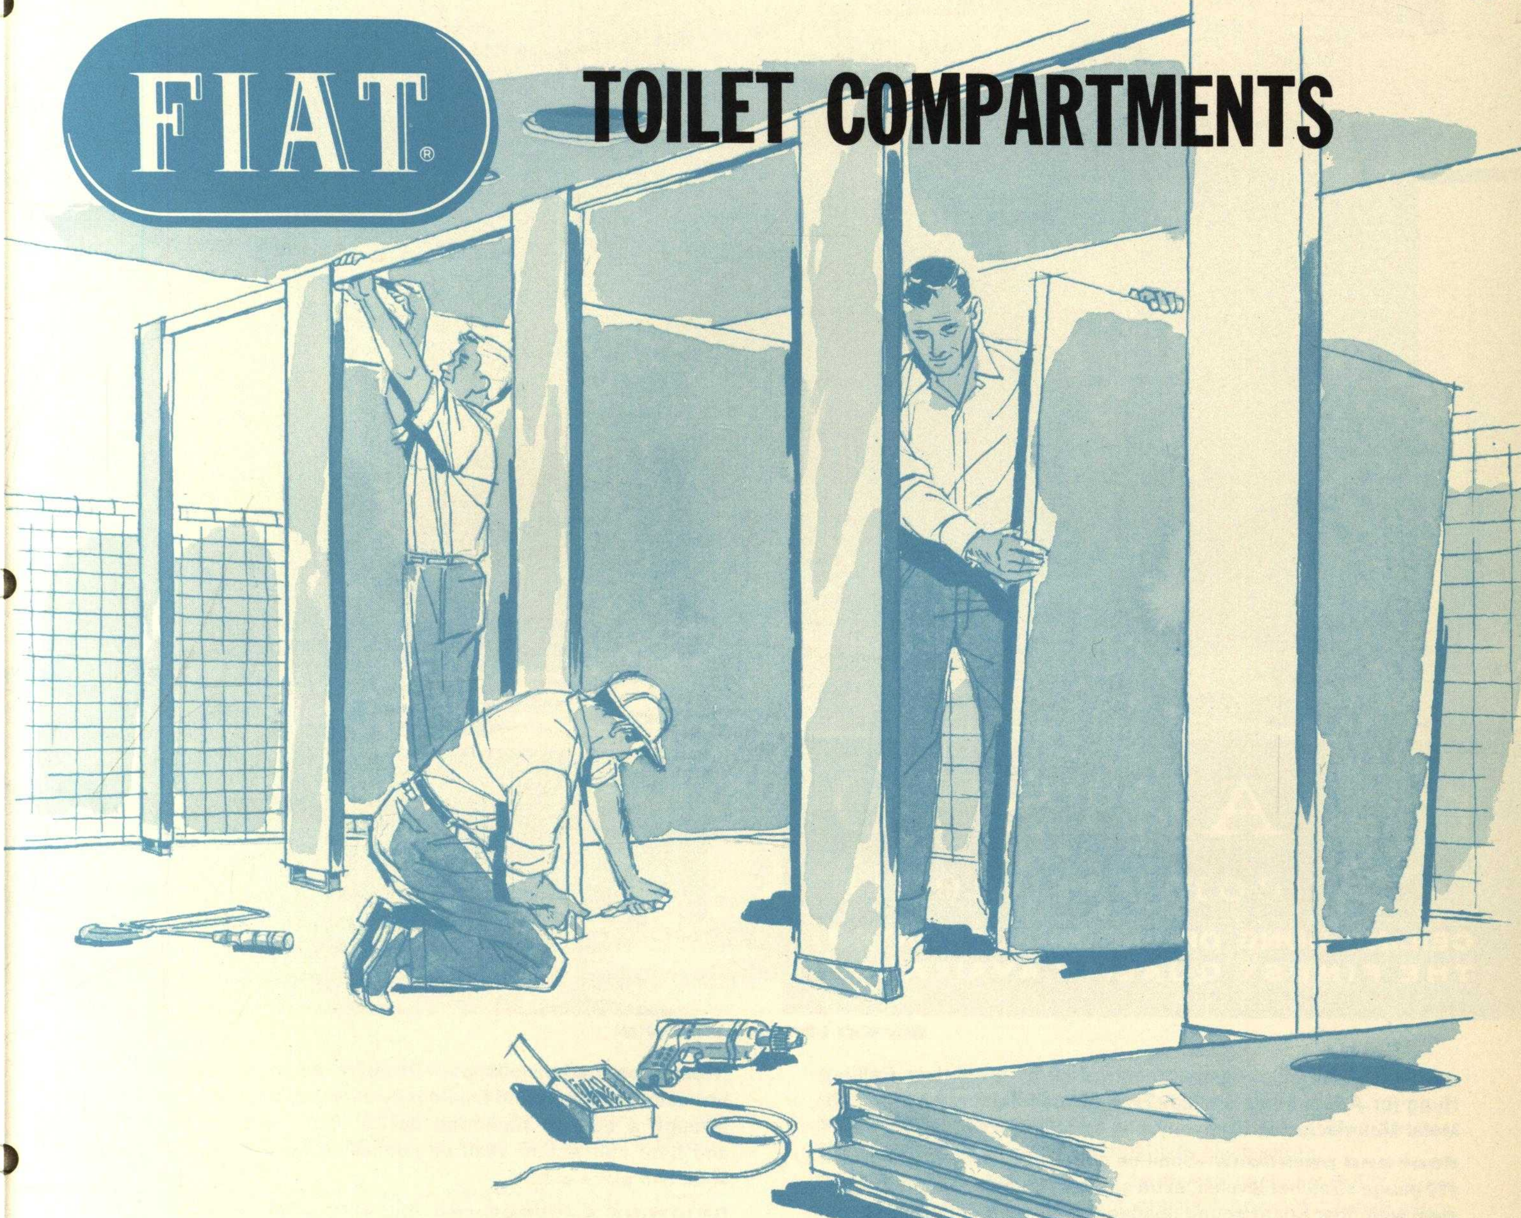
FIAT® TOILET COMPARTMENTS

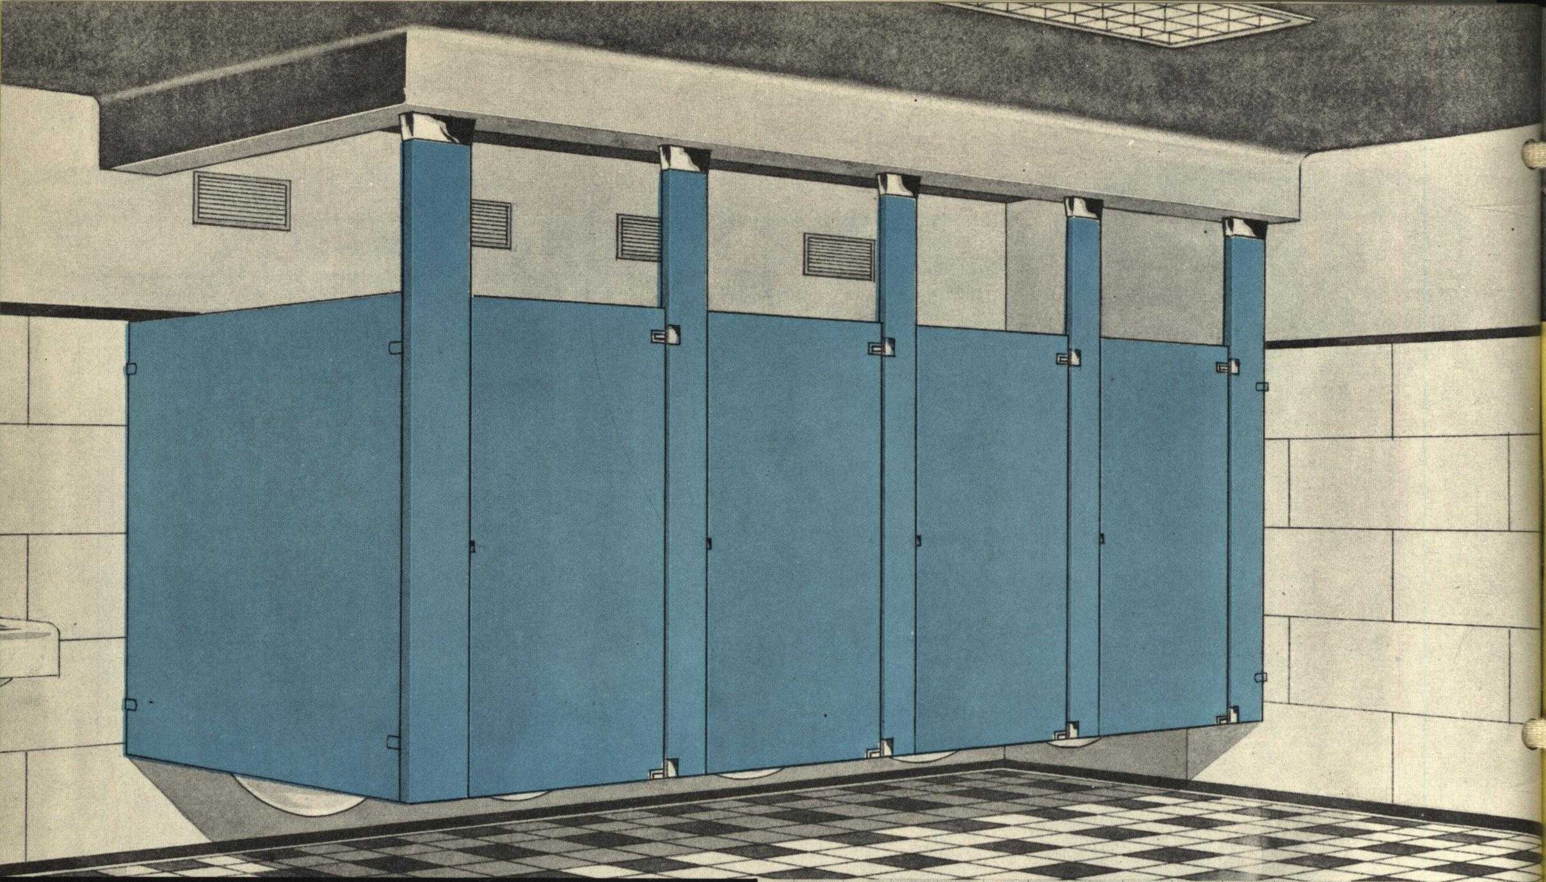


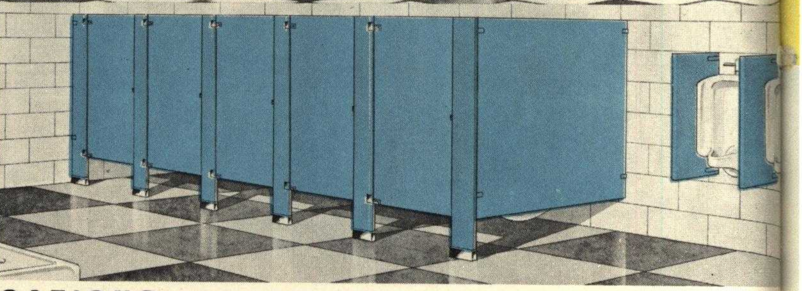
Simplify Specification—Speed Installation—Cut Costs

Compare quality . . . appearance . . . adaptability . . . availability . . . and price. You'll find that Fiat offers you the most!

Here are all-metal flush compartments built for beauty and endurance. Panels are of stretcher-leveled furniture steel, either galvanized-bonderized, or cold rolled steel. Hardware and connections are all of highest quality. *Finish* material is "Polycon," a silicon-fortified liquid plastic combination that has been heat cured and converted into a solid, tough film. "Polycon" was developed by FIAT after years of research—has an exceptionally high resistance to salt spray, humidity, sodium hydroxide and sulphuric acid.

The Fiat representative is qualified through experience to supply you with facts and figures that will save you time, trouble and money. He will be happy to consult with you on any special design problems. Call him soon for information on toilet compartments that'll put you *years ahead!*





FIAT ARISTO compartments

CEILING-HUNG OR FLOOR-SUPPORTED THE FINEST QUALITY AVAILABLE

SPECIFICATIONS

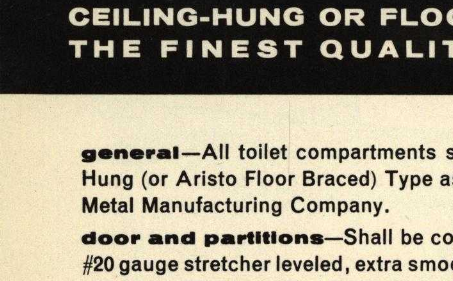
general—All toilet compartments shall be the Aristo Ceiling Hung (or Aristo Floor Braced) Type as manufactured by the Fiat Metal Manufacturing Company.

door and partitions—Shall be constructed of two sheets of #20 gauge stretcher leveled, extra smooth, bonderized-galvanized steel with fiber board sound deadener cemented uniformly to the metal. Doors and partitions shall be bound and interlocked under tension with drawn moulding welded on the corners.

pilasters—Shall be 1¼″ thick and constructed of two sheets of #16 gauge stretcher leveled, bonderized-galvanized steel cemented under pressure to a sound deadening core and interlocked together to form a tight tensile grip. (For Ceiling Hung installation)—Pilasters, when set in place, shall be securely anchored to the ceiling by means of Jack screw leveling through a built-in anchoring device. The top of the pilaster and ceiling connection shall be concealed by a 3″ high stainless steel plinth. (Floor supported installation)—Pilasters, when set in place, shall be securely anchored to the floor by means of Jack screw leveling through a built-in anchoring device. The bottom of pilasters and floor connection shall be concealed by a 3″ high stainless steel two piece plinth.

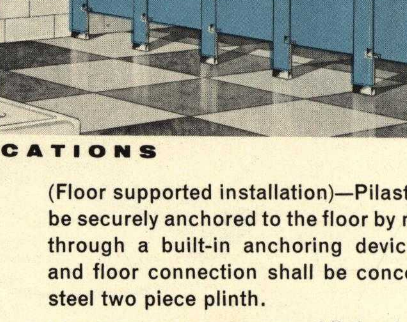
hardware & fittings—All hardware shall be FIAT "Life-Line" hardware with In-a-door gravity hinges of "Zytel" nylon and stainless steel pintle. Hinge brackets, keeper and bumper, coat hook and bumper, sliding door bolt, two-piece plinth and stirrup brackets to be stainless steel or non-ferrous metal brushed satin finished. Hardware shall be fastened with theft-proof screws.

finish—All surfaces to be thoroughly cleaned before finishing. Finish to be silicon reinforced poly plastic finish heat-cured for maximum protection and service life. Finish to be one color or one combination of two colors selected from Fiat's standard color chart.



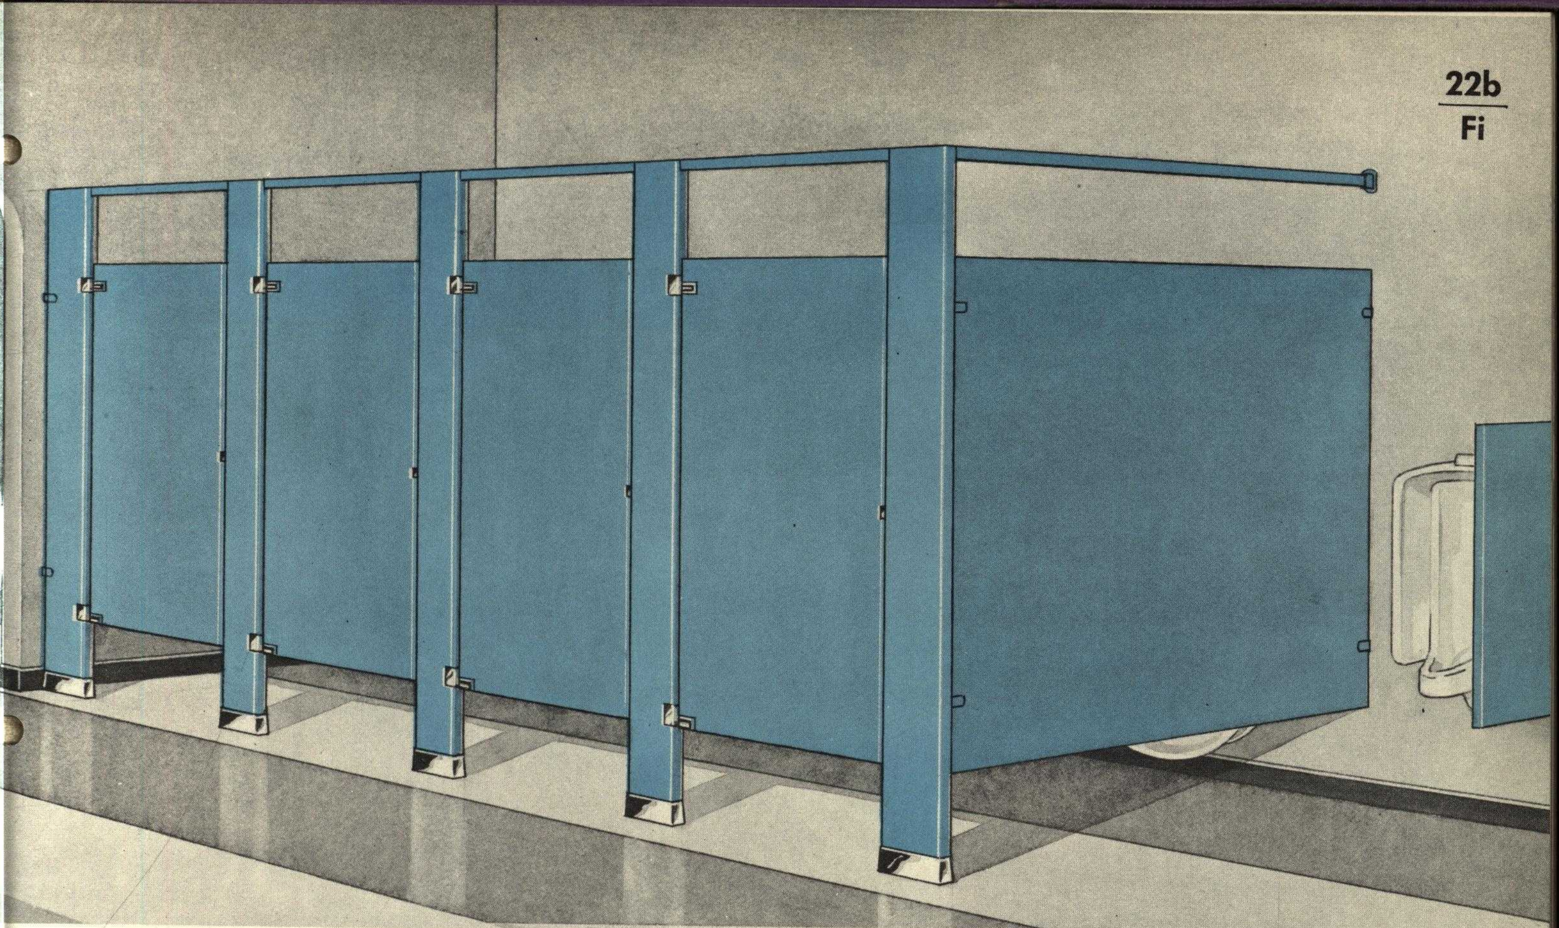
aristo jr. compartments

54″ high—for children in kindergarten and lower grades. These compartments have all the outstanding features of Aristo floor-supported models. Panels and doors are 6″ off floor; this keeps children in the confines of the compartment and discourages trips to adjoining compartments.



hospital cubicles

For hospital and institutional wards requiring semi-privacy . . . and cross ventilation without drafts . . . investigate Fiat cubicles. Special requirements can be met. Contact Fiat representative for complete information.



FIAT DURO compartments

MODERN, FLUSH-SURFACE DESIGN . . . HEADRAIL BRACED

SPECIFICATIONS

general—All toilet and shower dressing compartments shall be DURO Flush Type (headrail braced), of bonderized-galvanized steel or furniture stock cold rolled stretcher leveled, extra smooth steel (specify preference) as manufactured by Fiat Metal Manufacturing Company.

door and partitions—Shall be constructed of two sheets of #20 gauge stretcher leveled, extra smooth steel with fiber board sound deadener cemented uniformly to the metal. All edges shall be bound and interlocked with drawn moulding welded on the corners. Headrail shall be 1″ x 1½″ tubing.

pilasters—Shall be 1¼″ thick and constructed of two sheets of #20 gauge stretcher leveled steel, with fiber board sound deadener cemented uniformly to the metal, and interlocked together to form a tight tensile grip. (When 2″ pilasters are used, pilasters shall be 2″ #16 gauge steel tubing.) Pilasters when set in place shall be securely anchored to the floor with an adjustable floor saddle and locking bolt. Plinth retainer to be integral with floor saddle. The base of pilasters and floor connection shall be concealed by a 3″ high stainless steel two piece plinth.

hardware & fittings—All hardware shall be FIAT "Life-Line" hardware with In-a-door gravity hinges of "Zytel" nylon and stainless steel pintle. Hinge brackets, keeper and bumper, coat hook and bumper, sliding door bolt and stirrup brackets shall be non-ferrous metal brushed satin finished. Two-piece plinth shall be stainless steel brushed satin finished. Hardware shall be fastened with theft-proof screws.

finish—All surfaces to be thoroughly cleaned before finishing. Finish to be silicon reinforced poly plastic finish heat-cured for maximum protection and service life. Finish to be one color or a combination of two colors selected from Fiat's color chart.

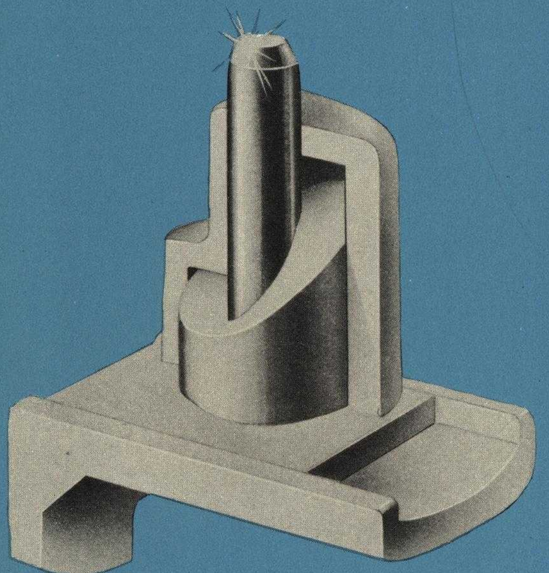
URINAL SCREENS

Features that put FIAT toilet compartments years ahead in styling, economy and service!



. . . with smooth-acting long lasting Zytel* Nylon Hinge—Here's a gravity hinge of durable nylon that NEVER needs care! No springs to replace . . . no undersized ball bearings to wear out . . . no periodic adjustments to make . . . no lubrication required. A million-cycle test revealed no visible signs of wear! This exclusive Fiat engineering development is just one of the reasons you'll be YEARS AHEAD with Fiat compartments!

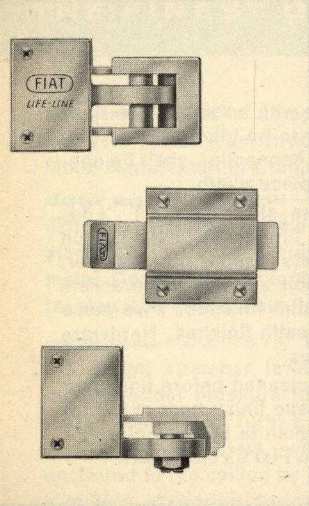
*DuPont T.M.

NO RUST

NO WEAR

NO NOISE

NO OILING



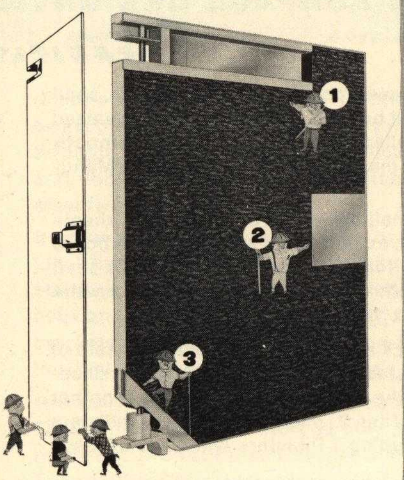
. . . with exclusive "Life-Line" hardware

TOP HINGE with Zytel Nylon bearing surface recessed indoor cut out. Can't corrode, remains chemically inert up to 450°F.

SLIDE BOLT works smoothly and surely, cushioned with nylon.

GRAVITY HINGE also concealed in door.

STIRRUPS newly designed to resist corrosion and permanently support compartments.



. . . with "golden gate" door

This door stands up to roughest use because it's engineered far beyond accepted standards. Here's the "inside story" in 3 parts: 1—Load equalizer distributes load away from top hinge, provides protection against such unusual loads as children swinging on door. 2—Impact absorber distributes shock of slamming over wide area. 3—Stress resistor provides basic side-to-bottom support and positively prevents door sway.

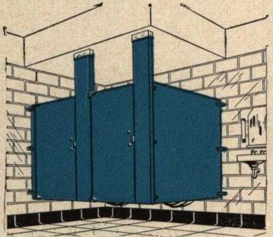
FLUSHWING®

pages 4 & 5

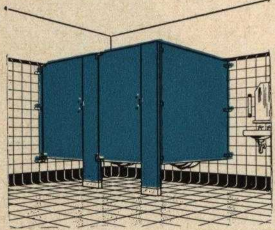
The most distinctive design available. Only wall support is required. Available in everlasting stainless steel or in synthetic baked enamel on galvanized bonderized steel.



FLUSHUNG

pages 3 & 6

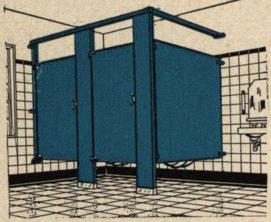
An unobstructed floor is made possible using Flushung construction. Available in everlasting stainless steel or in synthetic baked enamel on galvanized bonderized steel.



FLUSHART

pages 3 & 7

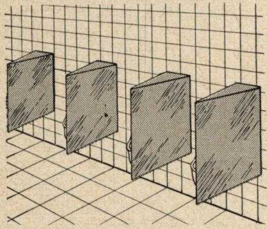
Modern clean lines for modern sanitary facilities. Available in everlasting stainless steel or in synthetic baked enamel on galvanized bonderized steel.



FLUSHITE

page 8

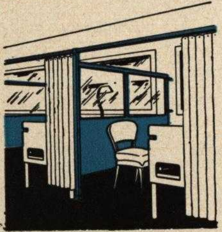
Pilaster construction with overhead bracing, which insures absolute rigidity. Available in galvanized bonderized steel with synthetic baked enamel finish.



URINAL SCREENS

page 9

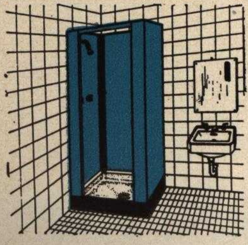
Wall-hung or floor-supported types, available in everlasting stainless steel or synthetic baked enamel on galvanized bonderized steel.



HOSPITAL CUBICLES

page 10

Flush panels prepared for glass—rigid, sound deadened, sanitary. Can be modified to suit any hospital requirement.



SHOWER COMPARTMENTS

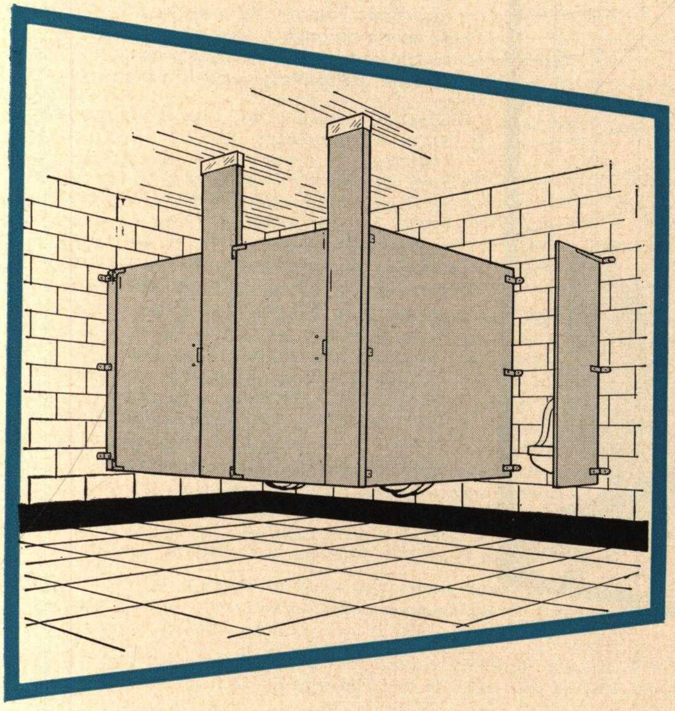
page 11

The finest shower unit available. Will not leak—no caulking compound required. Fewer parts—assembles easily in minutes. Clean looking—no overhangs on outside. Strong—heavier gauge steel than otherwise available. Economical—several models to fit any budget.

FLUSH-METAL PARTITION CORP.

THINK TO THE FUTURE WITH STAINLESS STEEL!

For unmatched beauty and durability, choose maintenance-free, life-time partitions of type 302, 18-8 nickel-chromium STAINLESS STEEL, available in No. 4 or No. 2B finish.



FLUSHUNG STAINLESS

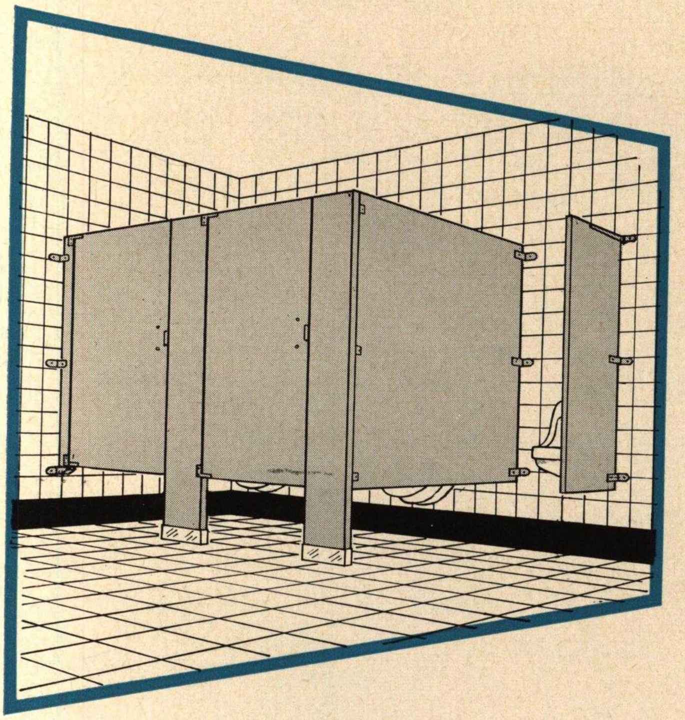
Toilet compartments shall be FLUSHUNG stainless as manufactured by the Flush-Metal Partition Corp. of Long Island City, N. Y.

PILASTERS to be FLUSHSEAL CONSTRUCTION using two formed 20 gauge stainless steel sheets locked on all edges with 16 gauge 302 stainless steel 1¼" deep, continuous, drawn, internal edge reinforcing, interlock channel moulding, cemented under pressure to a kraft honeycomb filler. Internal reinforcement to be provided for all connections. All edges to be welded at 8 inch intervals to make a 1¼" thick reinforced interlocked welded rigid unit. Corners to be welded and ground smooth. Upper part of pilasters to be reinforced with 14 gauge formed steel plates welded to ½" x 1" steel cross bar and to the vertical reinforcing channel moulding for fastening to hanging bolts.

PARTITIONS and **DOORS** to be FLUSHSEAL CONSTRUCTION using two formed 20 gauge 302 stainless steel sheets locked on all edges with 18 gauge 302 stainless steel ¾" deep, continuous, drawn, internal edge reinforcing, interlock channel moulding, cemented under pressure to a kraft honeycomb filler. All edges to be welded at 8 inch intervals, corners welded and ground smooth to make a 1" thick reinforced, welded rigid slab. Partitions to be fastened to the wall and to the pilaster with three 302 stainless steel brackets.

HARDWARE: Gravity hinge to be concealed in the door. Hinge brackets, latch and bumper hook to be solid forged brass, chromium plated. Combination strike and keeper to be 302 stainless steel.

FINISH: All stainless steel to have #4 or 2B finish.



FLUSHART STAINLESS

Toilet compartments shall be FLUSHART stainless as manufactured by the Flush-Metal Partition Corp. of Long Island City, N. Y.

PILASTERS to be FLUSHSEAL CONSTRUCTION using two formed 20 gauge 302 stainless steel sheets locked on all edges with 16 gauge 302 stainless steel 1¼" deep, continuous, drawn, internal edge reinforcing, interlock channel moulding, cemented under pressure to be a kraft honeycomb filler. Internal reinforcement to be provided for all connections. All edges to be welded at 8 inch intervals to make a 1¼" thick reinforced, interlocked, welded rigid unit.

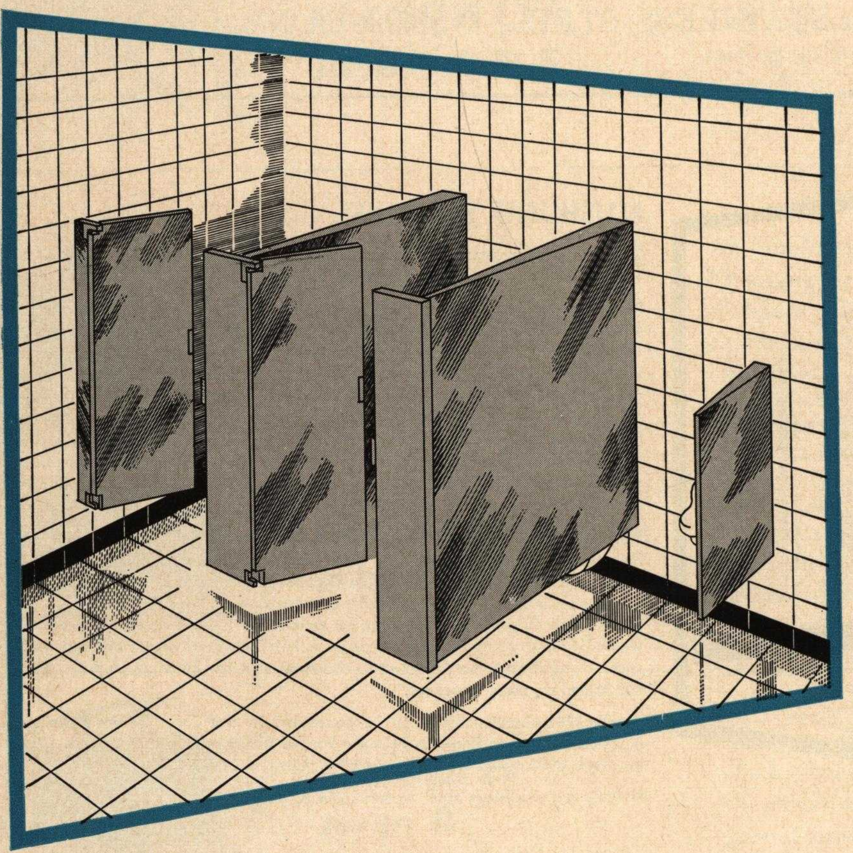
PARTITIONS and **DOORS** to be FLUSHSEAL CONSTRUCTION using two formed 20 gauge 302 stainless steel sheets locked on all edges with 18 gauge 302 stainless steel ¾" deep, continuous, drawn, interlock edge reinforcing, interlock channel moulding, cemented under pressure to a kraft honeycomb filler. All edges to be welded at 8 inch intervals, corners welded and ground smooth to make a 1" thick reinforced, welded rigid slab. Partitions to be fastened to the wall and to the pilaster with three 302 stainless steel brackets.

HARDWARE: Gravity hinge to be concealed in the door. Hinge brackets, latch and bumper coat hook to be solid forged brass, chromium plated. Combination strike and keeper to be 302 stainless steel.

FINISH: All stainless steel to have #4 or 2B finish.

YOUR BUILDING DESERVES THE BEST ►

A NEW CANTILEVER DESIGN BY FLUSH-METAL PARTITION CORP.



The most modern toilet partition in lustrous stainless steel or colorful baked enamel finish, Flushwing partitions are the final complement to your modern building. Flushwing's appeal is not limited to its smooth modern lines but extends to the distinctive sanitary characteristics of this completely wall-hung partition.

Quality engineered, the Flushwing design incorporates all of the desirable features of older types of partitions as well as many completely new innovations in the partition field. Since the entire partition is cantilevered from the wall, no pieces extend to the floor, and therefore rusting due to mopping is no longer a problem. No drop ceilings are needed for support of Flushwing. Paperholders are built into the partition itself. Cantilever brackets are welded to a back plate for firmness, and an 11 gauge steel frame is welded with vertical and diagonal reinforcing ribs. Flushwing partitions are available in both 302 stainless steel and baked enamel.

FLUSHWING® *toilet compartments*

THE PARTITION OF TOMORROW IN STAINLESS STEEL OR BAKED ENAMEL

specification

Toilet compartments shall be FLUSHWING as manufactured by the Flush-Metal Partition Corp. of Long Island City, N. Y.

PILASTERS to be FLUSHSEAL CONSTRUCTION using two formed 20 gauge 302 stainless steel (or galvanized, bonderized, stretcher-levelled steel) sheets locked on all edges with 16 gauge 1¼″ deep, continuous, drawn, internal edge reinforcing, interlock channel moulding, cemented under pressure to a kraft honeycomb filler. Internal reinforcement to be provided for all connections. All edges to be welded at 8 inch intervals to make a 1¼″ thick reinforced, interlocked, welded rigid unit.

DOORS to be FLUSHSEAL CONSTRUCTION made of two formed not less than 20 gauge 302 stainless steel (or galvanized, bonderized, stretcher-levelled steel) sheets locked on all edges with 18 gauge ¾″ deep, continuous, drawn, internal edge reinforcing, interlock channel moulding, cemented under pressure to a kraft honeycomb filler. All edges to be welded at 8 inch intervals, corners welded and ground smooth to make a 1″ thick reinforced welded rigid slab.

PARTITIONS to be made of two sheets of 20 gauge 302 stainless steel (or galvanized, bonderized, stretcher-levelled steel) sheets formed into a pan shape and welded to an 11 gauge steel reinforced skeleton frame to form a single rigid wedge shaped unit. Inside surfaces of partitions to be sound-deadened with 1″ thick kraft honeycomb filler. Inside reinforcing members of partitions shall be made to receive "T" wall support brackets and pilaster connecting brackets. "T" wall support brackets shall be of ½″ steel plate welded construction with upper and lower brackets welded to a common ½″ steel plate which is fastened to a supporting steel column. (This supporting column is required behind each partition and must be provided for in another specification.) All connecting bolts to be concealed and there shall be no projecting fittings at wall or pilaster. Tops and bottoms of partitions, doors and pilasters to be in one plane.

HARDWARE: Gravity hinge to be concealed in door. Hinge brackets, latch and bumper coat hook to be solid forged brass, chromium plated. Combination strike and keeper to be stainless steel.

FINISH: 302 stainless steel, #4 or 2B finish, (or two coats of 24 standard colors premium quality synthetic baking enamel, baked over rust and chemical resistant primer.)

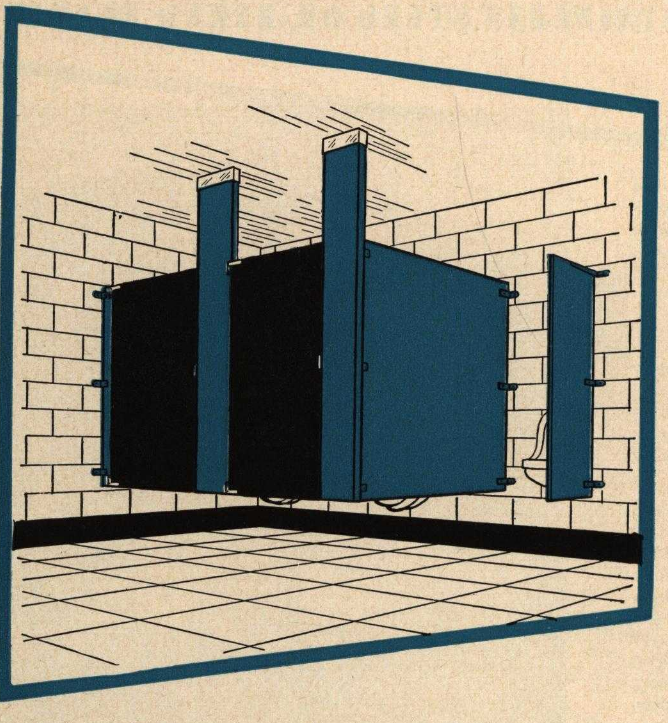
toilet compartments

FLUSHUNG



FLUSHUNG compartments have become increasingly popular in modern toilet rooms and have been used where sanitation is the first consideration. When used with wall hung fixtures and set 14″ off the floor they provide an unobstructed floor for most efficient cleaning. The FLUSHSEAL internally reinforced welded construction of the pilasters, doors and panels is essential for a rigid suspended installation. The doors should swing into the compartments and be hinged close to one side of the enclosure to provide maximum space at the latch side. (See layout "B" page 13.) For the suspension of the pilaster, this type of partition requires a structural member (not in the toilet partition specification) to be placed not over 7′-7″ from the finished floor.

specification

Toilet compartments shall be FLUSHUNG as manufactured by the Flush-Metal Partition Corp. of Long Island City, N. Y.

PILASTERS to be FLUSHSEAL CONSTRUCTION using two formed 18 gauge galvanized, bonderized, stretcher-levelled steel sheets locked on all edges with 16 gauge 1¼″ deep, continuous, drawn, internal edge reinforcing, interlock channel mouldings, cemented under pressure to a kraft honeycomb filler. Internal reinforcement to be provided for all connections. All edges to be welded at 8 inch intervals to make a 1¼″ thick reinforced, interlocked, welded rigid unit. Corners to be welded and ground smooth. Upper part of pilasters to be reinforced with 14 gauge formed steel plates welded to ½″ x 1″ steel cross bar and to the vertical reinforcing channel moulding for fastening to hanging bolts.

PARTITIONS and **DOORS** to be FLUSHSEAL CONSTRUCTION using two formed not less than 20 gauge galvanized, bonderized, stretcher levelled steel sheets locked on all edges with 16 gauge ¾″ deep, continuous, drawn, internal edge reinforcing, interlock channel moulding, cemented under pressure to a kraft honeycomb filler. All edges to be welded at frequent intervals, corners welded and ground smooth to make a 1″ thick reinforced, welded rigid slab. Partitions to be fastened to the wall with three heavy wrought steel (or 302 stainless steel if specified) brackets using six #14 special hex. washer head, hardened steel, plated screws with alloy expansion shields, and fastened to pilasters with three 14 gauge wrought steel (or 302 stainless steel if specified) brackets.

HARDWARE: Gravity hinge concealed in door. Hinge brackets, latch and bumper coat hook to be solid forged brass, chromium plated. Combination strike and keeper to be 302 stainless steel.

FINISH: Two coats of premium quality synthetic baking enamel, baked over rust and chemical resistant primer. Choice of 24 standard colors.

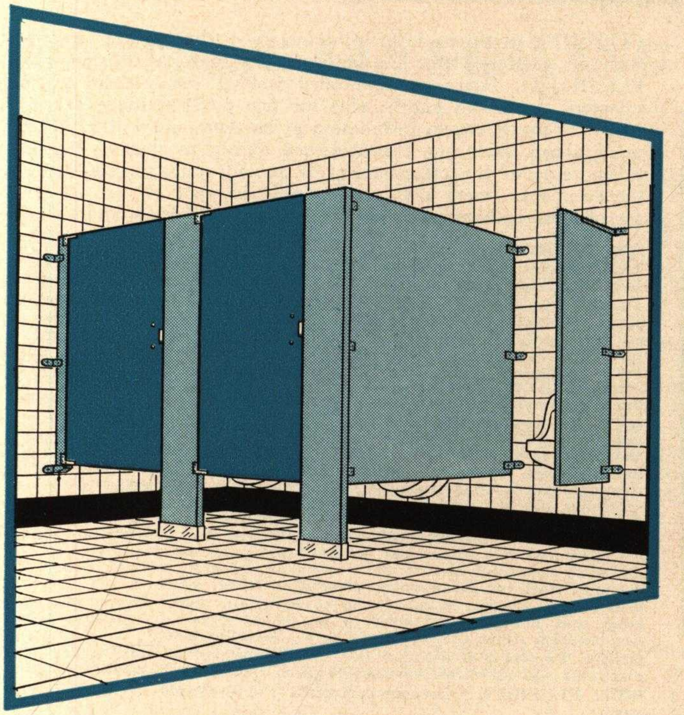
FLUSHART

toilet compartments



FLUSHART toilet compartments give a modern touch to the up-to-date rest room. The tops of the pilasters, panels, and doors are in one plane and, because there is no overhead bracing (from which children are apt to hang), the rigid units made possible by FLUSHSEAL reinforced welded construction are a must. Flushart compartments require a solid floor fastening for a rigid installation. Three floor fastenings are used for pilasters over 6" wide. Pilasters should be kept at right angles to partitions with doors swinging into the compartments, close to one side of the enclosure to provide maximum space at the latch side. Panels and doors should be kept 14" off the floor for easier cleaning and 5'-8" to the top for light and spaciousness.

specification

Toilet compartments shall be FLUSHART as manufactured by the Flush-Metal Partition Corp. of Long Island City, N. Y.

PILASTERS to be FLUSHSEAL CONSTRUCTION using two formed 18 gauge galvanized, bonderized, stretcher-levelled sheets locked on all edges with 16 gauge 1¼" deep, continuous, drawn, internal edge reinforcing, interlock channel mouldings, cemented under pressure to a kraft honeycomb filler. Internal reinforcement to be provided for all connections. All edges to be welded at 8 inch intervals to make a 1¼" thick reinforced, interlocked, welded rigid unit.

PARTITIONS and **DOORS** to be FLUSHSEAL CONSTRUCTION using two formed 20 gauge galvanized, bonderized, stretcher-levelled steel sheets locked on all edges with 18 gauge ¾" deep, continuous, drawn, edge reinforcing, interlock channel moulding, cemented under pressure to a kraft honeycomb filler. All edges to be welded at frequent intervals, corners welded and ground smooth to make a 1" thick reinforced, interlocked welded rigid slab. Partitions to be fastened to wall with three heavy wrought steel (or 302 stainless steel if specified) brackets using six #14 special hex. washer head, hardened steel, plated screws and alloy expansion shields, and fastened to pilasters with three 14 gauge wrought steel (or 302 stainless steel if specified) brackets.

HARDWARE: Gravity hinge to be concealed in door. Hinge brackets, latch and bumper coat hook to be forged brass, chromium plated. Combination strike and keeper to be 302 stainless steel.

FINISH: Two coats of premium quality synthetic baking enamel, baked on over rust and chemical resistant primer. Choice of 24 standard colors.

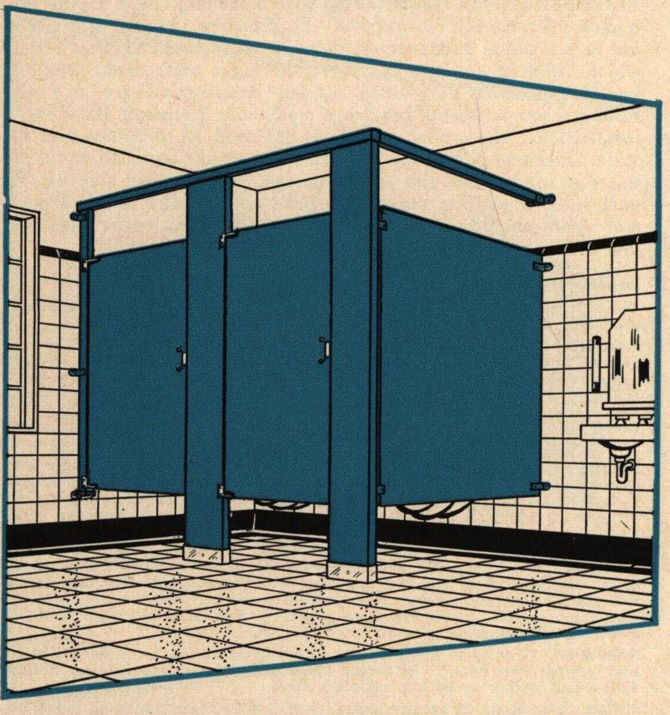
FLUSH-METAL PARTITION CORP.

46-10 11th STREET LONG ISLAND CITY 1, N. Y. STILLWELL 4-3380

FLUSHITE



FLUSHITE partitions feature the beauty of the pilaster type construction combined with the strength of the overhead brace. The FLUSHSEAL internally reinforced welded construction of the pilasters, doors and panels, plus the one piece seamless headrail make for the strongest installation of its type, and will withstand much abuse. Note how the doors are hinged as close as possible to one side of the compartment to provide maximum space for the occupant. Doors and panels should be kept 14" off the floor for efficient maintenance and 5'-8" to the top for air and light.

specification

Toilet compartments shall be Flushite as manufactured by the Flush-Metal Partition Corp. of Long Island City, N. Y.

PILASTERS to be FLUSHSEAL CONSTRUCTION using two formed 20 gauge galvanized, bonderized, stretcher-leveled steel sheets locked on all edges with 16 gauge 1¼" deep, continuous, drawn, internal edge reinforcing, interlock channel moulding, cemented under pressure to a kraft honeycomb filler. Internal reinforcement to be provided for all connections. All edges to be welded at 8 inch intervals to make a 1¼" thick reinforced interlocked, welded rigid unit.

PARTITIONS and **DOORS** to be FLUSHSEAL CONSTRUCTION using two formed 20 gauge galvanized, bonderized, stretcher-levelled steel sheets locked on all edges with an 18 gauge ¾" deep, continuous, drawn, internal edge reinforcing, interlock channel moulding, cemented under pressure to a kraft honeycomb filler. All edges to be welded at 8 inch intervals, corners welded and ground smooth to make a 1" thick reinforced, interlocked, welded rigid slab. Partitions to be fastened to wall with two heavy wrought steel (or 302 stainless steel if specified) brackets using four #14 special hex, washer head, hardened steel plated screws and alloy expansion shields, and fastened to pilasters with two 14 gauge wrought steel (or 302 stainless steel if specified) brackets.

HARDWARE: Gravity hinge to be concealed in door. Hinge brackets, latch and bumper coat hook to be forged brass, chromium plated. Combination strike and keeper to be 302 stainless steel.

FINISH: Two coats of premium quality synthetic baking enamel, baked on over rust and chemical resistant primer. Choice of 24 standard colors.

NOTE: FLUSHITE toilet compartments are available in 302 stainless steel.

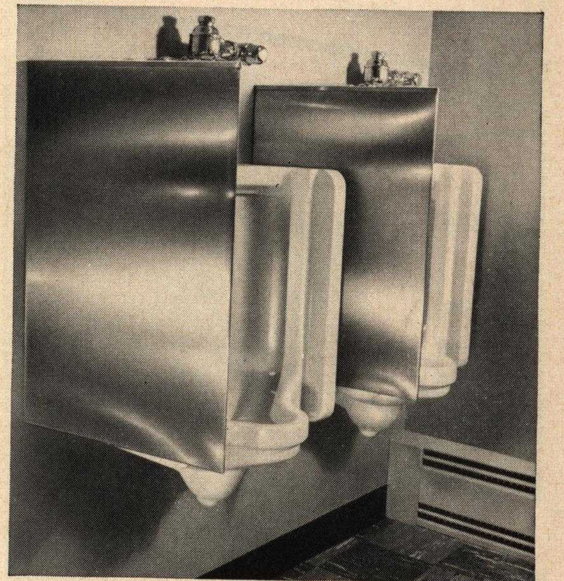
FEATURING FLUSHWING STAINLESS STEEL SCREENS

specification

Urinal Shields shall be FLUSHWING as manufactured by the Flush-Metal Partition Corp. of Long Island City, New York.

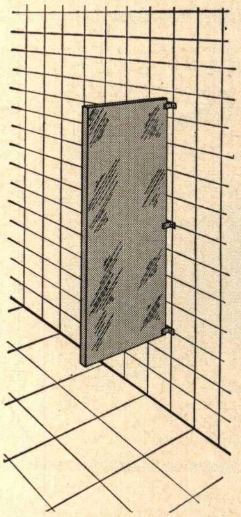
The body of the shield shall consist of one piece 18 gauge 302 stainless steel. Top and bottom covers to be 20 gauge 302 stainless steel, electrically welded to body to form a single unit. The shield shall have its inner surfaces treated with a sound deadening vermin-proof material.

After fabrication all welds and rough spots to be ground smooth, and the entire unit to be given a uniform satin finish. The Urinal Shield shall be mounted on a full height galvanized, bonderized steel bracket. This bracket shall be finished in synthetic baked enamel and fastened to the wall with five fastenings of not less than ¼″ diameter cadmium plated hex. head hardened steel screws and alloy expansion shields, or toggle bolts if required. When completed the unit shall be rigidly mounted with concealed fastenings. Unit shall be left protected with kraft paper covering for removal by owner when ready for use.

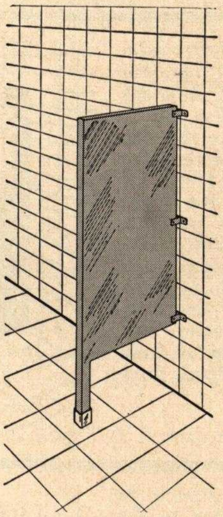


Urinal shields of stainless steel feature the maximum of corrosion resistance and the minimum of maintenance needs.

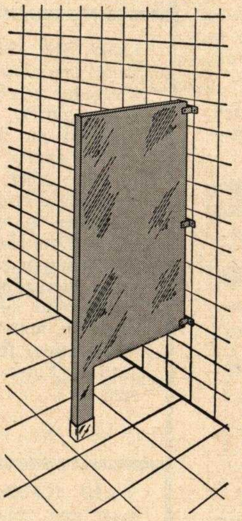
FLUSHIELD



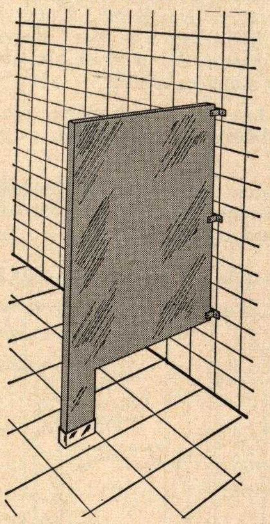
FLUSHART WALL PILASTER



WALL PILASTER WITH WIDE LEG



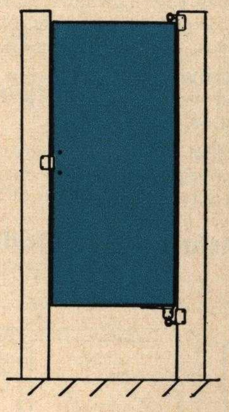
FLUSHART WALL PANEL



Flushield urinal shields are rigid Flush-Metal panels braced with three heavy polished 302 stainless steel or enameled wrought steel wall brackets. Screens are available in depths up to 18″ as shown above. They are also available with a post to the floor, post-and-headrail bracing, or additional headrail triangle bracing, for extra rigidity under conditions of heavy strain. Use partition specification on page 3 for a stainless steel screen and partition specification on page 7 for a baked enamel finish, and add "Flushield as by Flush-Metal Partition Corp."

Flushart wall pilasters are extremely rigid, sturdy, and easy to keep clean. The legs are an integral welded part of the unit, and are anchored to the floor with expansion bolts and protected with a heavy 302 stainless steel shoe. Screens for depths up to 21″ are available with a 1¼″ x 1½″ leg, and the 24-inch deep screen is provided with a 3-inch leg.

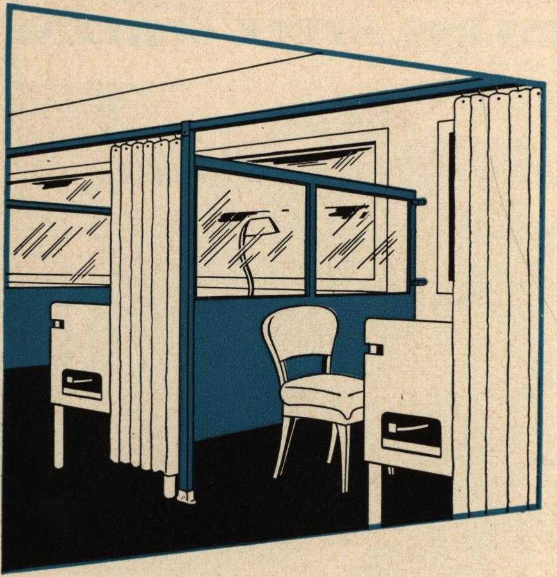
For depths from 28 to 42 inches, one-inch thick wall panels are employed, which are constructed similarly to the 1¼-inch thick wall pilasters. They are braced with a 6 inch wide leg for added stability. All wall pilasters and panels are fastened to the wall with heavy polished stainless steel or enameled wrought steel brackets. For specification in a stainless steel finish, use the Flushart pilaster specification on page 3. For a baked enamel finish use the pilaster specification on page 7.



Flush-Metal doors on marble

The doors should be swung into the compartment. Although 1¼″ stile thickness is most common, Flush-Metal hardware for other stile thickness is available. For door specification see page 8. Hardware is solid bronze chromium plated. The drilling of marble should be specified for the marble contractor.

hospital cubicles



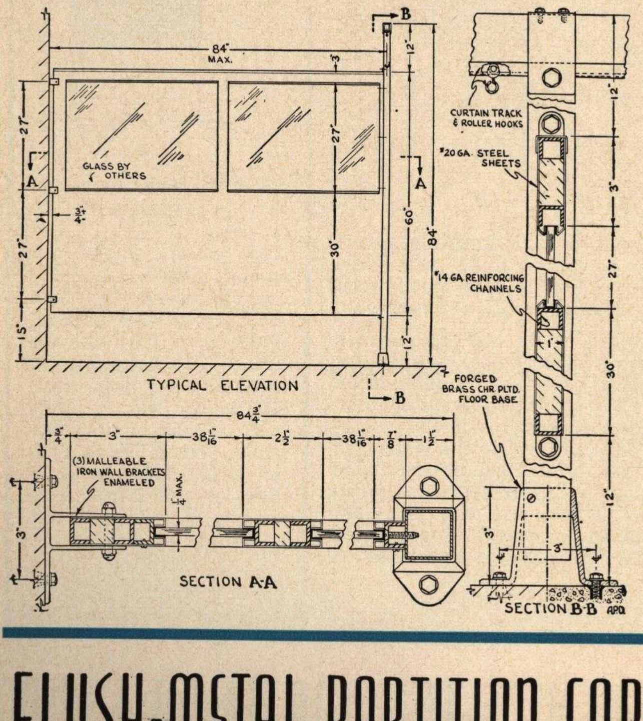
specification

PARTITIONS to be constructed of two not less than 20 gauge galvanized, bonderized, stretcher-levelled steel sheets, spot welded to 16 gauge reinforcing channels on all four edges and cemented under pressure to a kraft honeycomb filler. Panels to be constructed with removable vertical mouldings for easy installation of glass (glass furnished and installed by others). Upper and lower edges of steel sheets to be formed in a sanitary shape to receive glass, and form an integral part of the partition. Headrail, where required, to be 1½″ square seamless tubing.

HARDWARE—Post base to be solid forged brass, chromium plated, and brass chromium plated coat hooks to be installed, as stipulated.

FINISH—One heavy coat of premium quality synthetic baking enamel over rust and chemical-resistant primer. Each coat baked on separately. Choice of 24 standard colors.

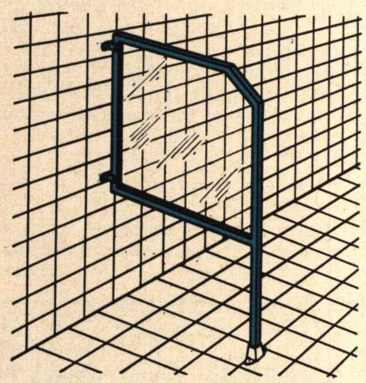
installation details • 1¼″ & 2″ = 1′-0″



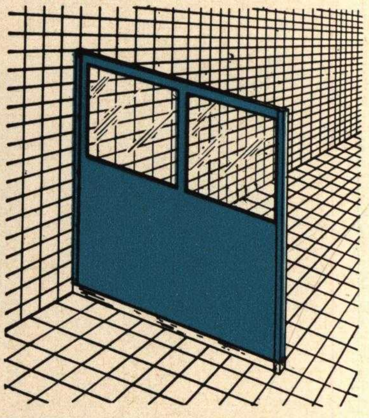
FLUSH-METAL hospital cubicles feature the basic flush type construction adapted for easy insertion of ¼″ thick glass. Small nursery cubicles can usually be designed to be self supporting. The larger ward screens generally require headrail bracing. All Flush-Metal hospital cubicles are rigid, sanitary and adaptable to any place where separation is required in the hospital.

Shown below are a few of the various metal and glass partitions we have manufactured for hospital use. Each was designed for a specific purpose, but they all were engineered for solidity, permanence, sanitation and minimum maintenance.

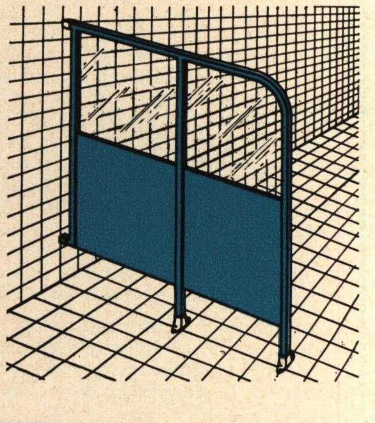
BASSINET SEPARATOR consisting of seamless tubing and glass designed for nursery use. Note extreme economy of material, accomplishment of desired separation and maximum visibility which facilitates observation. This partition has been used singly as shown and in multiple free standing units.



ISOLATION SCREEN—solid from floor up to prevent direct air passage from one side to other. Also objects dropped on floor by one patient cannot be retrieved by the other. From the flush, no crevice top of this partition to the polished, lifetime stainless steel base moulding there is no finer material available, no greater amount of care exercised in manufacture and installation than is built into a Flush-Metal product.



WARD SCREEN similar in type and function to the cubicle shown at left but illustrated here to show how a standard product was modified to meet an Architect's design. On this particular installation a solid bar was secured to the rough floor slab to act as an internal shoe inside the vertical tubing. Special brackets were built into the wall at the exact heights required. Note the rounded front. A special design—competitively priced—guaranteed to give satisfaction and years of trouble free service.

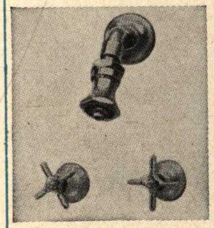


FLUSHOWER

shower compartments

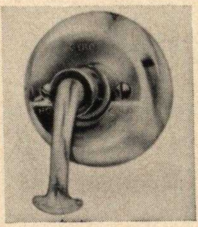
FLUSHOWERS are designed to meet every requirement of modern building construction. They are sanitary, pleasing in appearance, leakproof, economical and made of rust-proofed steel, finished with baked-on enamel in various colors to harmonize with any color scheme. They are recommended for all types of buildings and homes.

FLUSHOWERS are constructed so the back and side walls interlock on a pre-cast non-slip receptor to form a single water tight, rigid unit, thus eliminating unsightly screws and mastic compounds. They can be furnished singly or in batteries with mixing valves, dome lights, side sprays and glass shower doors. Flushowers with Flushite or Flushart dressing compartments make an unsurpassed combination. Installation of Flushowers should be specified in the Plumbing specification.



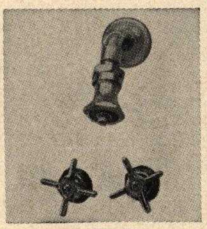
S-640

Polished chromium plated 6″ on center with ball joint adjustable self-cleaning shower head.



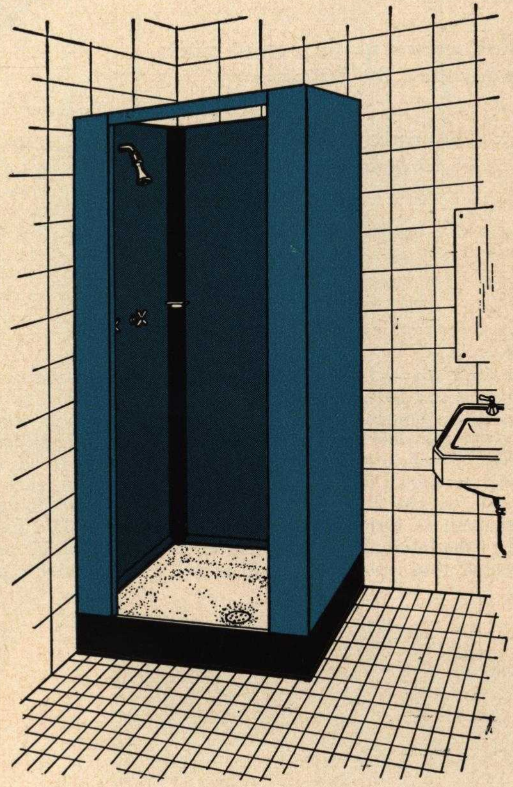
8H

Polished chromium plated single lever mixing valve with ball joint adjustable self-cleaning shower head.



S-199

Dull chromium plated 3⅜″ on center with ball joint adjustable self-cleaning shower head.



also available in stainless steel

SARATOGA

Size: 36x36x82 (square); 42x42x82 (corner).

Receptor: 6″ high terrazzo with black and white marble chips and white cement enclosed in a rust-proofed metal frame.

Walls: 16 gauge galvanized bonderized steel finished inside and outside with 3 coats of synthetic baked enamel.

Equipment: Soap dish, curtain rod and designated valve set. Top, dome light and glass door are optional.

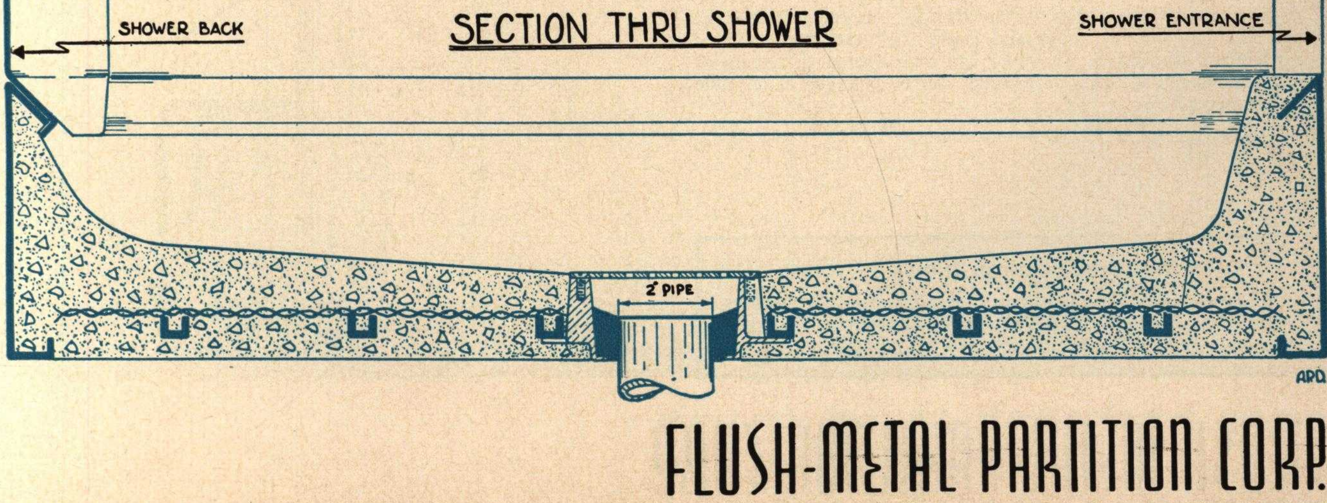
STONEBROOK

Size: 32x32x76; 36x36x76.

Receptor: 6″ high Stonebrook type cast with white marble and black carborundum chips in a rust-proofed metal frame.

Walls: 18 gauge galvanized bonderized steel, finished inside and outside with 2 coats of synthetic baked enamel.

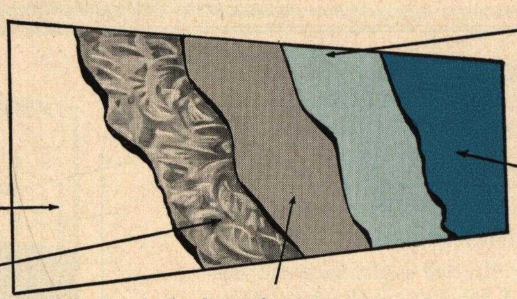
Equipment: Soap dish, curtain rod, vinyl plastic curtain and designated valve set.



FLUSH-METAL PARTITION CORP.

46-10 11th STREET LONG ISLAND CITY 1, N. Y. STILLWELL 4-3380

SYNTHETIC BAKED ENAMEL FINISHES



Primer Coat—
A new epoxy formulation which provides exceptional resistance to alkali, moisture and other corrosive action while serving as a permanent bond between the enamel and the metal.

Finish Coats—
A premium quality synthetic baking enamel available in 24 decorator colors resistant to fading, staining and chipping. The finish is both decorative and protective and will give many years of service with minimum care. A color guide can be obtained from any representative or from the factory. Special colors are available—samples must be sent to the factory for matching.

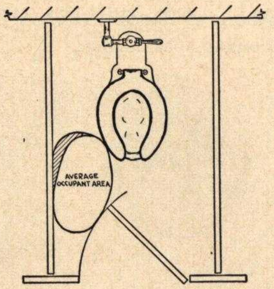
Cold rolled prime quality steel sheet, stretcher-levelled for flatness.

Galvanized coating—
for corrosion resistance.

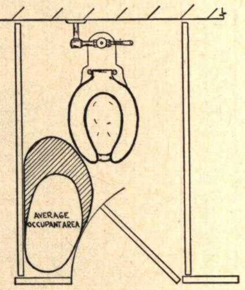
Bonderized coating—
A phosphate coating prepares the galvanized coating for tight paint adherence and also resists corrosion.

Door Location

Note in Layout A, the average occupant of the compartment brushes against the fixture in order to turn around to close the door. This is a common layout used by other manufacturers in order to center the door on the compartment. Flush-Metal functional design specifically features the door to one side of the compartment as shown in Layout B leaving maximum space at the latch side to give ample room with much to spare for the average occupant to turn around and latch the door. The panel is fastened to the internal reinforcement of the FLUSHSEAL reinforcing channel, thus insuring strength as well as functionality and sanitation.



LAYOUT "A" DOOR IN CENTER

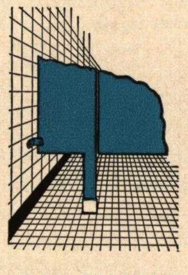


LAYOUT "B" DOOR TO ONE SIDE

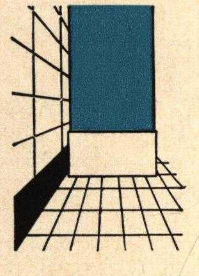
Wall Pilaster Construction

The new Flush-Metal wall pilaster is designed to take advantage of having pilasters which are adjacent to walls fastened to the floor as well as the wall. Note the cutout which permits cleaning next to the wall. No dirt pocket is formed using the Flush-Metal wall pilaster (Flushart Construction). Note that a dirt pocket is created by the standard pilaster as shown above.

This is another design feature where Flush-Metal functional engineering has improved on standard competitive practices.



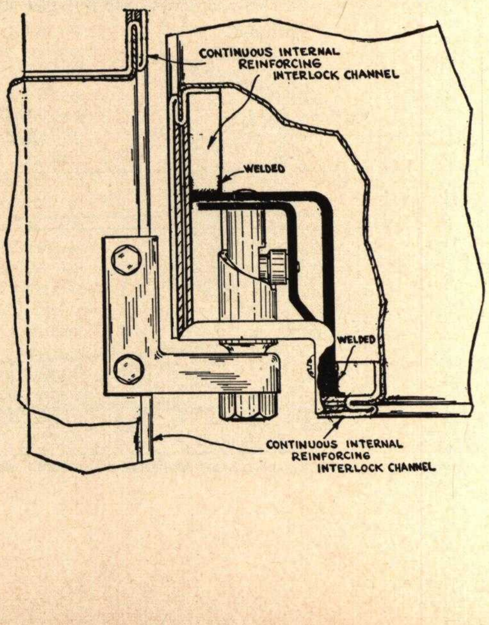
WALL PILASTER



STANDARD PILASTER

New Internal Gravity Hinge

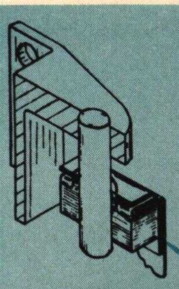
This new gravity hinge has its mechanism concealed inside the door. The ball bearing roller and heavy steel cam are designed for a lifetime of service. The door can be adjusted to remain at any desired position. This adjustment can be changed at anytime in a few seconds.



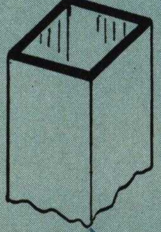
CONTINUOUS INTERNAL REINFORCING INTERLOCK CHANNEL
WELDED
WELDED
CONTINUOUS INTERNAL REINFORCING INTERLOCK CHANNEL

HARDWARE SPECIFICATIONS SHOULD BE CLEAR!

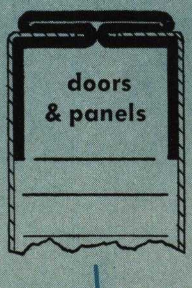
Either forged brass, chromium plated, or stainless steel for the DELUXE line, or non-ferrous die cast for the ECONOMY line.

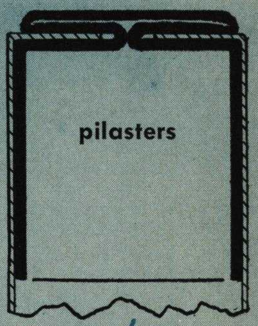


Upper Pivot Assembly—The bracket is **solid forged brass** not a thin stamping or diecasting. The pivot is a ground **stainless steel*** pin—that will never rust. The bearing is miracle *nylon*—self lubricating—noiseless. We have tested it over 10,000,000 revolutions without its showing any sign of wear.

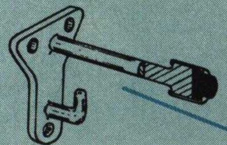


Heavy Gauge Seamless Tubing—Drawn, continuously welded tubing without cracks or butted joints. More expensive but much stronger, neater and more sanitary.

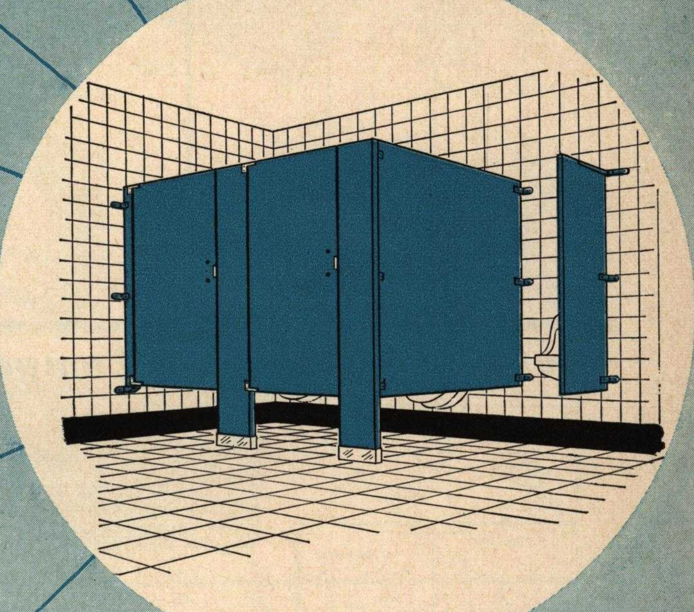


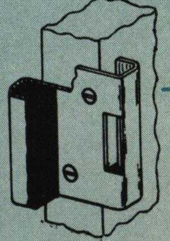


FLUSHSEAL CONSTRUCTION (Reinforced-welded)—A new method of flushpanel fabrication (Pat. Pending). All edges are locked and internally reinforced with heavy 16 or 18 gauge drawn channel moulding, a Flush-Metal exclusive. All edges are welded at 8 inch intervals to make a rigid, permanent slab. Panels and doors are always made of 20 gauge—never any lighter.

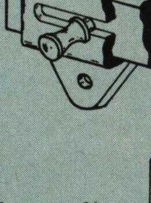


Bumper Coat Hook—A heavy **solid brass forging**—note that the live, non-marking rubber is secured with a brass chromium plated ferrule—no nails or removable tips. The hook is secured with special hex washer head hardened sheet metal screws.

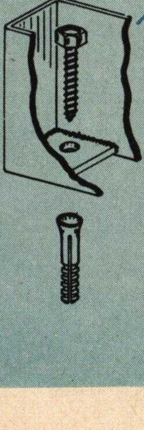




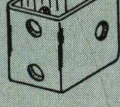
Combination Door Strike and Keeper — solid stainless steel* for high strength and durability. The return bend which rests against the pilaster takes the shock of the door slam off the screws. The 2¾″ long solid rubber is retained not only by friction but with 6 teeth pressed into the rubber.



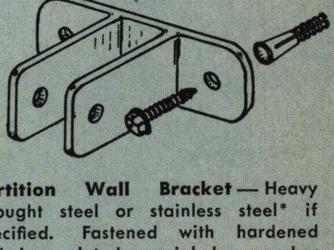
Latch — solid forged brass case with ¼″ x 1″ **solid stainless steel*** slide. A rugged piece of hardware that is practically indestructible. The extra heavy slide which takes the abuse has no plating to wear, and is spring mounted for smooth operation.



Floor Shoe—14 gauge **solid stainless steel***—This is not a light gauge trim that will rattle and dent. The Flushart stainless steel shoe is an integral part of the installation. It is secured with heavy, long, hardened, cadmium plated steel screws and alloy expansion shields. **Three floor fastenings** are used on pilasters over 6″ wide—a Flush-Metal exclusive.



Partition Pilaster Bracket—14 gauge wrought steel or stainless steel* if specified. Note double screw fastenings into partition and into pilaster instead of a single through bolt. At each point the screw is anchored to heavy gauge internal reinforcing channels.



Partition Wall Bracket—Heavy wrought steel or stainless steel* if specified. Fastened with hardened cadmium plated special hex washer head screws and alloy expansion shields—**Three** wall brackets on each partition is a Flush-Metal exclusive.

*Flush-Metal uses only nickel bearing type 302 stainless steel.

FLUSH-METAL PARTITION CORP.

46-10 11th STREET LONG ISLAND CITY 1, N. Y. STILLWELL 4-3380

Toilets

Alcove Compartment

To keep the construction uniform where the alcove, or in-line single compartment layout is used (when FLUSHART compartments are specified) Flush-Metal "wall panels" will be furnished on compartments up to 72" wide; otherwise headrail bracing is recommended. The pilaster panel is 1¼" thick, of the same rigid Flushseal Construction as other pilasters with the sanitary corner cutout which permits easy cleaning.

Flushower units can be used singly or in battery. Where pipe spaces occur, fillers to match the showers are furnished. The use of Flushowers eliminates the need for waterproof floor and wall construction. Assembly of showers and the plumbing connections must be provided for in the plumbing specifications. A typical layout is shown at left.

Dressing compartments can have either doors or curtains, and metal or wood seats are optional. One clothes-hook is provided in each dressing compartment as standard equipment. If more than one hook is required in each compartment, the specifications should so state.

Flushite partitions may be used as shower partitions when complete single units are not desired. A flat, level curb is required and panels must be set in caulking compound to make waterproof connections. The height of the partitions depends on the height of curb and the architects requirements. A typical layout is shown at right.

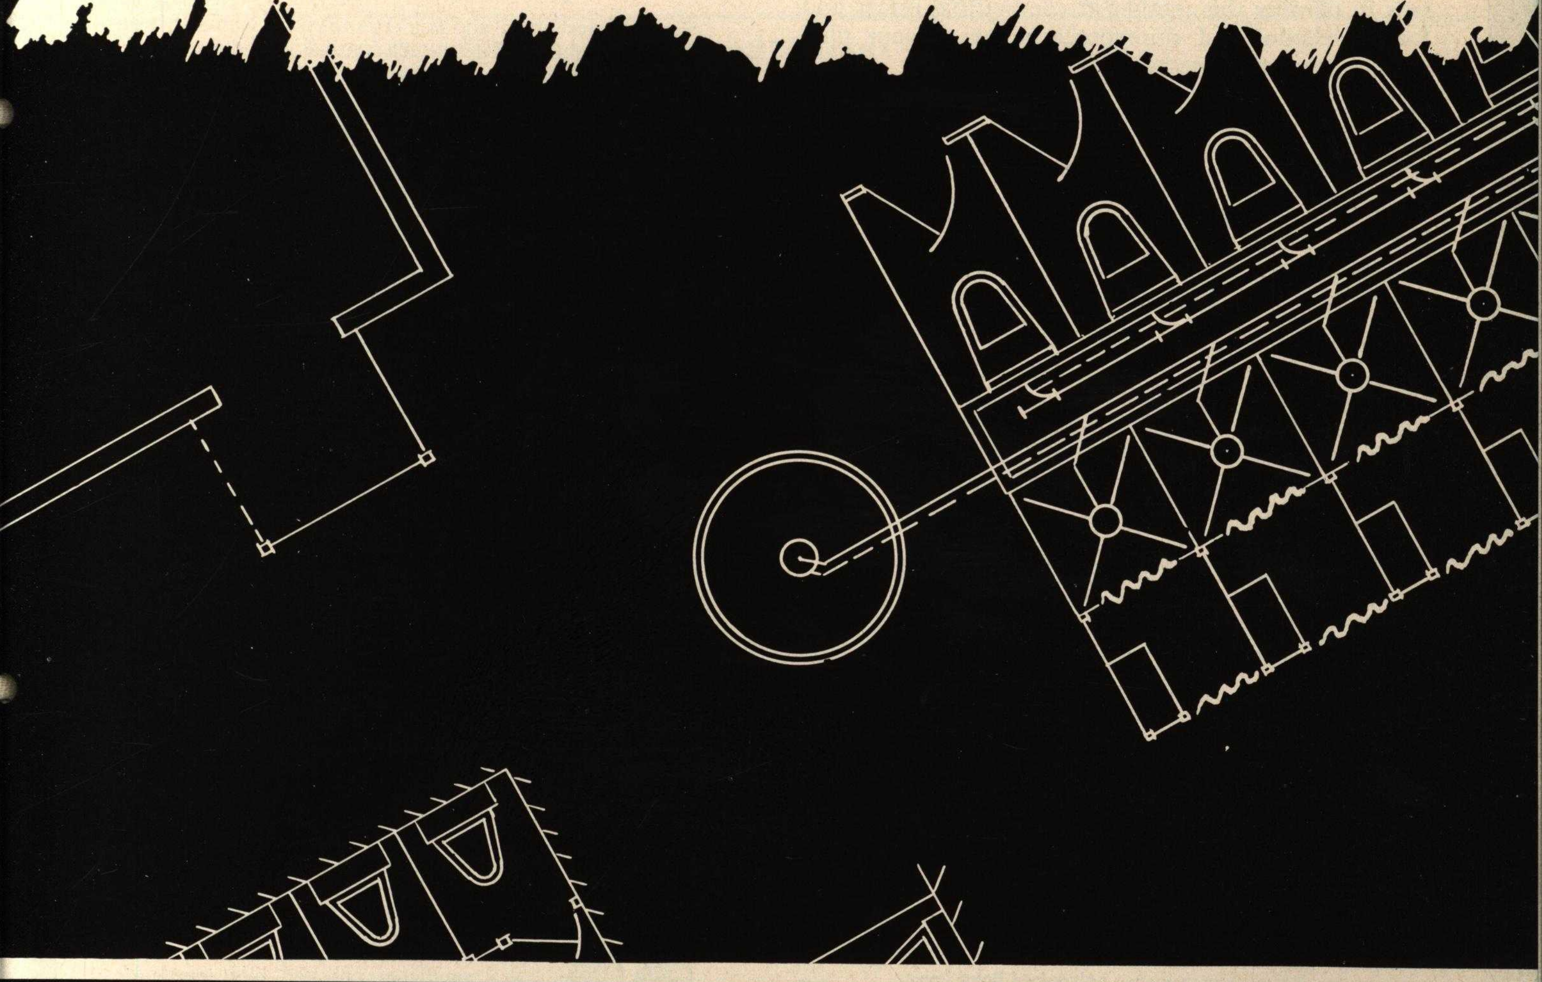
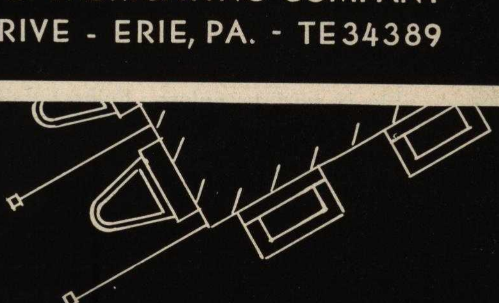
TOILET PARTITIONS



General
ERIE

GENERAL WELDING & FABRICATING COMPANY
1702 PENINSULA DRIVE - ERIE, PA. - TE34389



a complete line of toilet partitions

Recognizing the need for a high quality of partitions General Welding and Fabricating Company has, since its inception, produced a complete line of metal toilet partitions, dressing booths, and shower enclosures.

Our experienced personnel has been successful in incorporating the best features of the industry's recognized construction standards with new designs and ideas for production which have enabled us to steadily expand our plant and sales facilities.

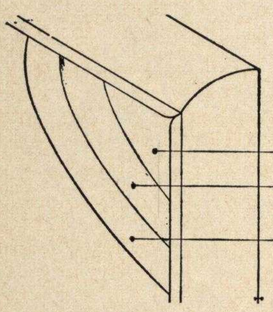
We are dedicated to serving the construction industry with the finest quality partition available. Our success in offering this quality at competitive prices and fastest schedules of shipment accounts for our phenominal growth.

---

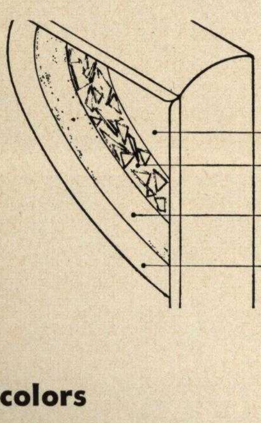
finishes

Paint baked on enamel is available in all designs; its beauty and durability is surpassed only by our highest quality finish porcelain enamel, which is available on design No. 30-2; No. 40-2; No. 50-2.

porcelain



baked synthetic enamel



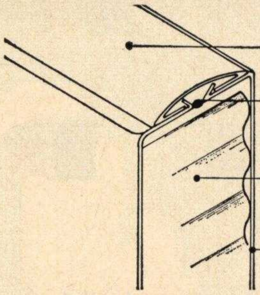
colors

Paint baked enamel and porcelain enamel are available in various colors. Fastest delivery is assured in standard colors.

Two standard colors per order may be chosen from our color chart at no extra charge. Porcelain enamel colors are more brilliant and have more depth than paint finishes. Color chips are available.

construction features

pilasters, doors, and panels

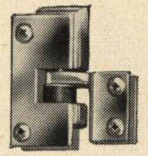


continuous die drawn molding locks face plates of pilasters, doors and panels; concealing raw edges
weld
expanded hexagonal honeycomb filler
metal walls cemented to honeycomb filler

Strength, durability, and fine craftsmanship combine in permanently joined face plates which are welded prior to application of die drawn molding. Molding is continuous, completely concealing all raw edges.

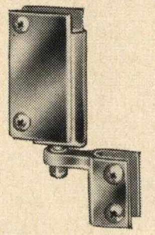
Full width honeycomb type fillers provide sound deadening insulation on all flush styles. Racking is prevented due to careful lamination, under pressure, of cores to inner surface of face plates with water proof binder.

flush top hinge



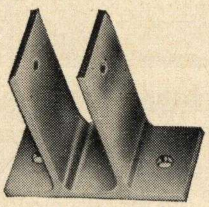
Maximum strength and serviceability is assured with latest engineered top hinge assembly placed in a cut out even with the top level of the door. The hinge pin is securely anchored above and below the bearing point with four point contact. Exclusive new shock absorber device on top hinge pin cuts down on sound in toilet rooms resulting from slamming of doors and prevents doors from being forced. Doors swing to 120° with absorber device activating at 85°.

concealed bottom gravity hinge



Working parts of bottom hinge assembly are completely concealed and enclosed within the door to prevent vandalism and tampering. Hardened steel cam and simplified working parts, which have a roller bearing with case hardened roller race, incorporates latest engineered principles with the time proven merits of a gravity hinge.

brackets



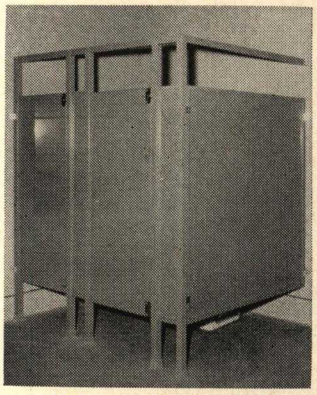
No painted "T" brackets are used. Even our economy styles feature lustrous wall and pilaster stirrup brackets which are anodizing, polished, high tensile air craft type aluminum, matching today's modern motifs. General Welding & Fabricating Company has pioneered in the use of aluminum for toilet partitions.

wall hung urinal screens

Maintenance is kept to a minimum when GENERAL'S wall hung urinal screens are used. This unit relies on secure anchorage to a solid wall and avoids expensive upkeep, inevitably found where urinal screens must be anchored to the floor. Face plates are formed to provide a continuous flange which is anchored at six points to the wall. The wide flange is reinforced with a heavy steel plate. Exclusive engineered wing type construction gives strength with combined flexibility to prevent wall damage.

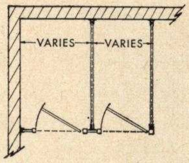
General
PARTITIONS

"10" series (post and sheet panel, headrail braced)



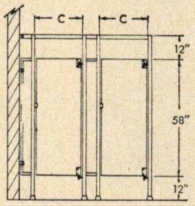
design 10-1—is used in remodeling where similar design must be matched.

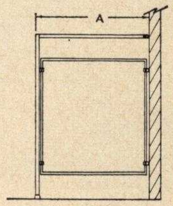
specifications: All toilet partitions shall be GENERAL Design 10-1. All doors shall be 1" thick, 20-gauge level Galvanized and Bond steel, neatly formed and welded together before attaching die drawn moulding. Door filler shall be honeycomb board glued to interior sides of the formed sheets. Panels are single 18-gauge galvanized and Bond sheet construction, with formed moulding at top and bottom. Posts shall be 1¾" square tubing, with polished non-ferrous foot. Headrails shall be 1 x 1¾" steel tubing recessed into the posts. All metal surfaces shall be finished with baked synthetic enamel at 310° F. See Specifications (page 4) for hardware.



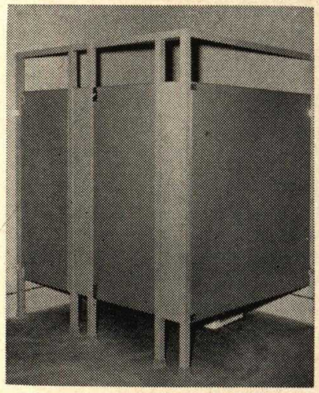
A = 36", 42", 48", 54", 57"
other sizes available

C = 22", 24"
other sizes available



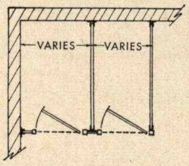


"20" series (post and flush panel, headrail braced)



design 20-1—is a flush design economical to install.

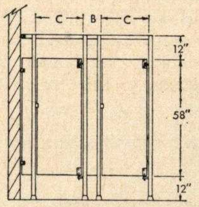
Specifications: All toilet partitions shall be GENERAL Design 20-1. All panels and doors shall be 1" thick, 20-gauge level galvanized and Bond steel, neatly formed and welded together before attaching die drawn moulding. Door and panel filler shall be honeycomb board glued to interior sides of the formed sheets. Posts shall be 1¾" square tubing with polished non-ferrous foot. Headrail shall be 1 x 1¾" steel tubing recessed into the posts. All metal surfaces shall be finished with baked synthetic enamel at 310° F. See Specifications (page 4) for hardware.

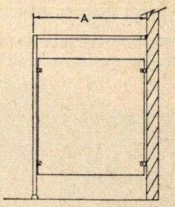


A = 36", 42", 48", 54", 57"
other sizes available

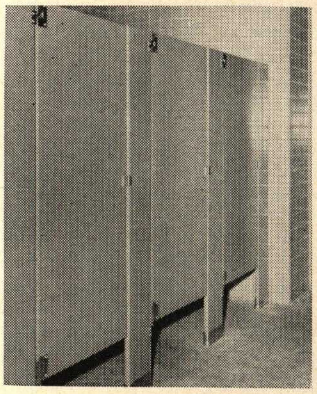
B = to 12"
other sizes available

C = 22", 24"
other sizes available





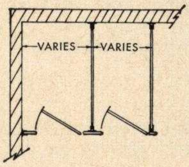
"30" series (floor supported pilaster and flush panel)



design 30-1—this modern design is popular and may be used where floor thickness permits application of heavy anchor bolts or floor studs.

See Specifications (page 4) regarding panels, doors, pilasters, hardware and baked enamel finish.

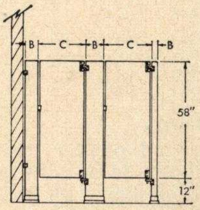
design 30-2—same construction as 30-1 but with porcelain enamel finish. Panels and doors 18-gauge; pilasters 18-gauge (16-gauge, if specified) non-ferrous, chrome-plated hardware, and polished stainless steel shoes. See Specifications (page 4).

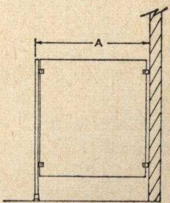


A = 36", 42", 48", 54", 57"
other sizes available

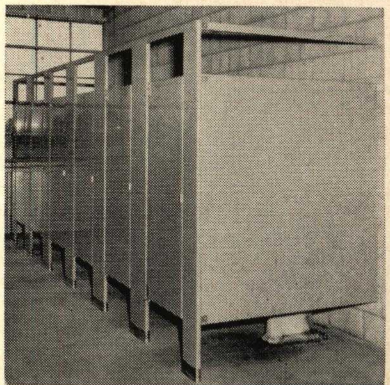
B = 2", 3", 4", 5", 6", 8", 9", 10", 12"

C = 22", 24"
other sizes available





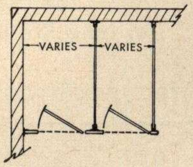
"40" series (pilaster and flush panel, headrail braced)



design 40-1—ever-popular all flush, headrail braced style for use with any floor system. See Specifications (page 4), regarding panels, doors, pilasters, headrails, hardware, and baked enamel finish.

design 40-2—same construction as 40-1 but with porcelain enamel finish. Panels and doors 18-gauge (16-gauge if specified) non-ferrous chrome plated hardware. Polished stainless steel shoes. See Specifications (page 4).

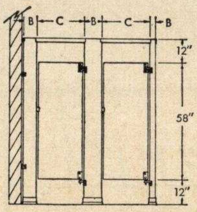
design 40-5—same design and finish as 40-1 featuring latest painted aluminum pilasters or 20-gauge steel pilasters and bull-dog type floor connection. Economy style with no sacrifice of strength, beauty, or quality. See Specifications (page 4).

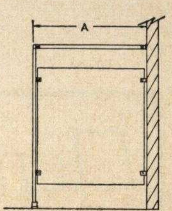


A = 36", 42", 48", 54", 57"
other sizes available

B = 2", 3", 4", 5", 6", 8", 9", 10", 12"

C = 22", 24"
other sizes available

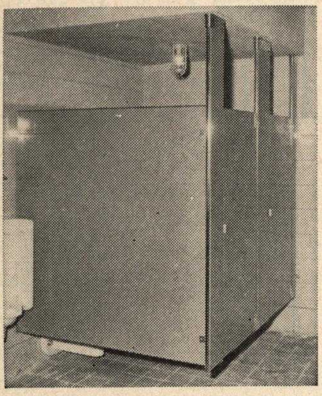




GENERAL WELDING AND FABRICATING COMPANY

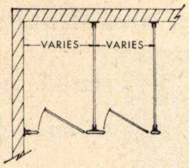
toilet partitions

"50" series (ceiling hung pilaster and flush panel)



design 50-1—upkeep, general maintenance, and ease of cleaning are now available at no extra cost with our latest baked enamel ceiling hung compartments. See Specifications (page 4) regarding panels, doors, pilasters, hardware, and baked enamel finish.

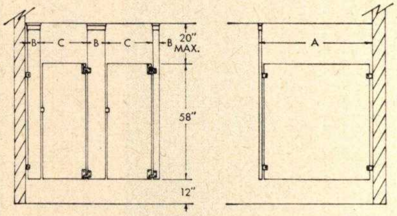
design 50-2—same construction as 50-1, but with porcelain enamel finish. Panels and doors 18-gauge; pilasters 18-gauge (16-gauge if specified). Non-ferrous, chrome-plated hardware polished stainless steel shoes. See Specifications (page 4).



A = 36", 42", 48", 54", 57"
other sizes available

B = 2", 3", 4", 5", 6", 8", 9", 10", 12"

C = 22", 24"
other sizes available



specifications

scope

All metal compartments for toilets, showers, and dressing rooms shall be Design .... (insert type) as manufactured by General Welding & Fabricating Co., Erie, Pa.

panels

Panels shall be 1" thick with two sheets of 20-gauge level galvanized and Bond steel, formed and welded together before attaching die drawn molding on all four sides of panels. Corners to be mitered, welded, and ground smooth. Fillers shall be pads of hexagonal honeycomb expanded to 1" maximum cell size, with cells of 0.009 caliper craft paper 26 lbs. per 1,000 square feet minimum. All glued to interior sides of formed sheets.

doors

Doors shall be of same construction and gauge as panels.

pilasters

Pilasters to be same construction as panels except that they shall be 1¼" thick with 18-gauge (16-gauge available if specified by architect) steel face plates. Die drawn molding to be applied to vertical edges and exposed sides of pilasters. Pilasters shall be anchored to the floor or ceiling by means of a fitting providing for vertical adjustment which shall not depend upon friction.

steel

All steel shall be galvanized and Bond, Republic Electro Zink Coat level steel of the folowing gauges:

Partitions	20-gauge	
Pilasters	18-gauge	(16-gauge available if architect so specifies)
Doors	20-gauge	
Reinforcing channels.	18-gauge	
Handrail, steel......	18-gauge	1" x 1¾" (or Polished Aluminum with .090" wall).

hardware & fittings

Brackets—both wall and pilaster stirrup brackets to be anodizing, polished, high tensile air craft type aluminum. (Brackets are chrome-plated for designs with porcelain finish.)

Pilaster Floor Trim—3" high, stainless steel, formed escutcheon type shoe.

Hinges—doors shall be hung on gravity hinges with hardened steel cam, adjustable to permit doors to be set either self-closing, self-opening, or ajar. All operating parts shall be enclosed within the door. Upper hinge pin shall be placed in a cut out even with the top level of the door with hinge pin anchored above and below the bearing point with four point contact. Top hinge shall have shock absorber device on hinge pin to prevent door from being forced beyond 85°. Doors shall swing to 120° with absorber device activating at 85°. Both top and bottom hinge units shall be anodizing, polished high tensile air craft type aluminum. (Hinges are chrome-plated for designs with porcelain finish.)

Coat Hooks, Latches, Bumpers—each door to be equipped with one cast alloy chromium plated coat hook, bumper, and slide bar latch with keeper. Fastenings shall be Phillips head type, or vandal proof—one way heads (specify one).

finish and color

Baked synthetic enamel (for designs no. 10-1, 20-1, 30-1, 40-1, 40-5, 50-1).

All surfaces to be cleaned and sanded smooth prior to application of synthetic enamel applied in separate operations utilizing latest viscosity controlled hot spray methods, and baked at 310° F. Color coat to be baked to a uniform, smooth, lustrous, protective finish. Finished paint thickness to be no less than 1¼ mill, as recommended by national paint manufacturers. Two colors to be selected from manufacturer's color chart.

Vitreous Porcelain Enamel (Designs no. 30-2, 40-2, 50-2).

All surfaces to be cleaned and sanded smooth prior to application of a base coat of vitreous porcelain on the inside and outside of each formed piece. Finish color coat shall be separately applied to exterior of units. Process all in accordance with Porcelain Enamel Institute standards.

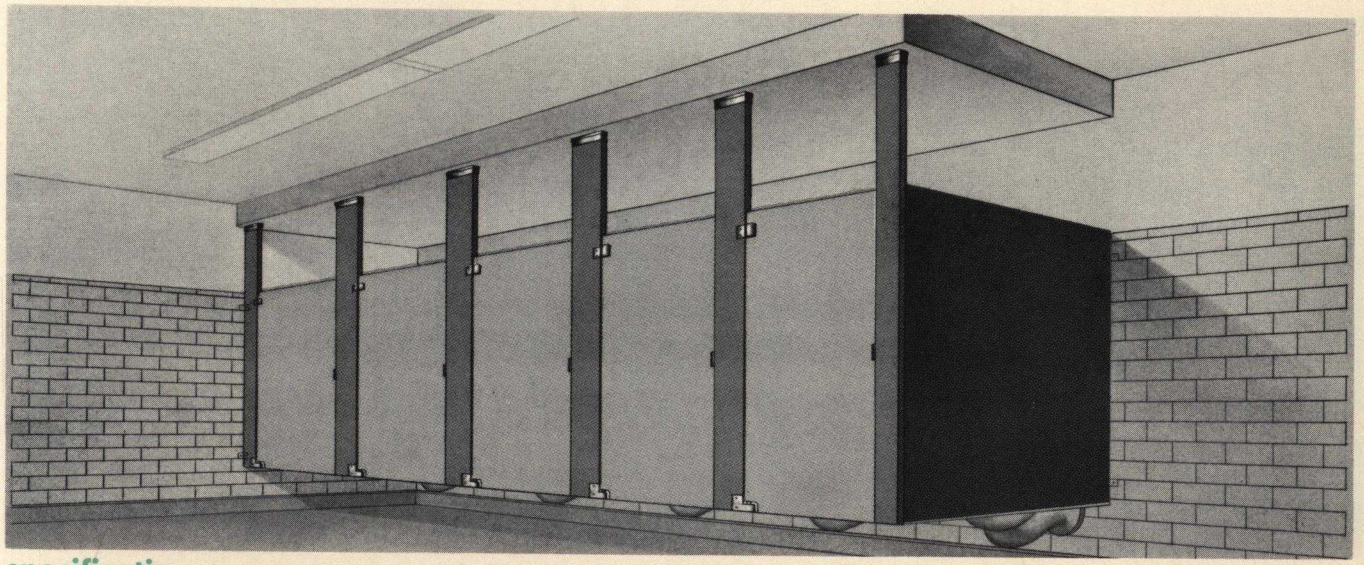
H — Final coat

CEILING HUNG FLUSH PANELS TYPE CHF



specifications

doors and partitions: Shall be 1" thick constructed of two sheets of #20 gauge Galvanized-Bonderized steel assembled over and cemented under pressure to a sound deadening fibre core insulation. The face plates of the partitions shall have formed edges and sealed with continuous oval crown locking strips mitred and welded at corners.

pilasters: Shall be 1 ¼" thick constructed of two sheets of #16 gauge Bonderized-Galvanized steel securely re-inforced with #18 gauge oval locking strips. Pilasters when set in place shall be securely anchored to ceiling beam members. Ceiling Beam to be furnished, installed and drilled by others, (Drilling Template supplied by Knickerbocker) to receive anchoring devices for Pilasters before finish plaster has been applied. Pilasters shall have a 3" high #20 gauge stainless steel floor plinth.

fittings: Wall fittings to be non ferrous castings (brass-zinc). All hardware and fittings to be fastened by means of tamper proof sex bolts and self tapping tamper proof screws. Fittings are painted color to match partitions as a standard, chrome plated available at additional charge.

hardware: Hinge brackets shall be non ferrous castings chrome plated. Doors shall be hung on universal gravity hinges with concealed ball bearing rollers and hardened cam mounted in a recess in the edge of door. Upper hinge pin assembly to set in cutout near top of door. No hardware shall extend above or below door line. Doors shall be fitted with a combination keeper and bumper, slide latch and coat hook with rubber tipped bumper. (All of non ferrous castings.) Door pulls and two prong coat hooks supplied with outswinging doors.

finish: All materials shall be given one coat of rust resisting primer baked on followed by two coats of high temperature baked synthetic enamels. Color as selected.

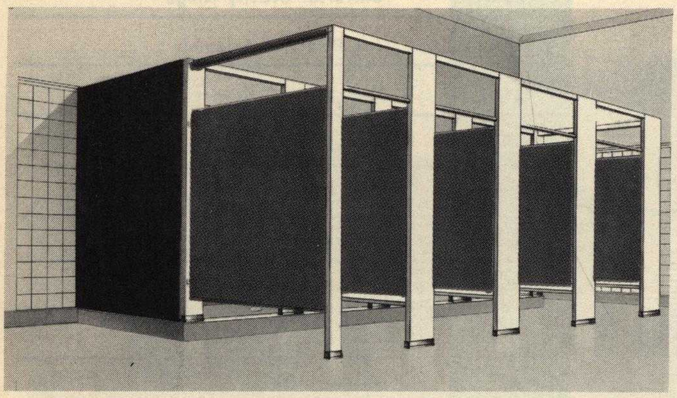
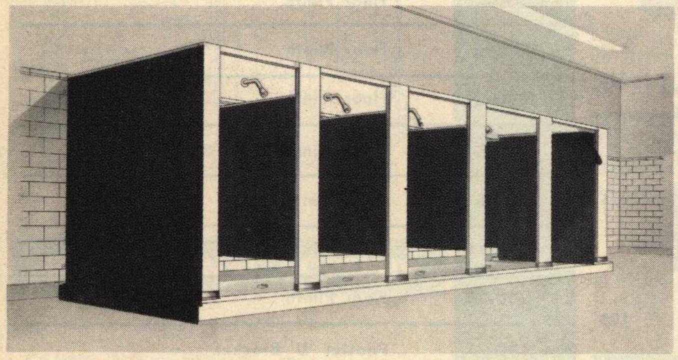
DRESSING ROOMS & SHOWER STALLS



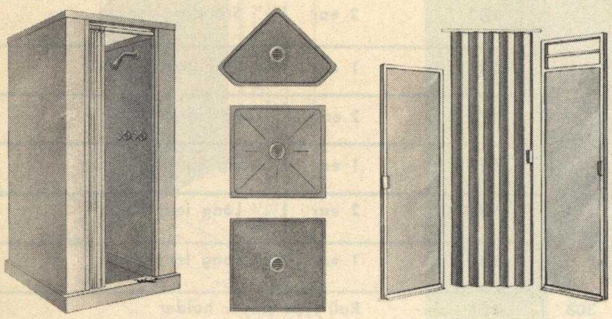
dressing rooms & shower stall compartments are available in our full flush line of partitions such as; TYPES XLFH and CHF with concrete curbs to be built and supplied by others. (Refer to pages 3 and 4 for specifications of both these types). Curtain carriers, curtains and curtain rods supplied at additional cost. Doors are furnished with dressing room compartments with choice of Slide Bolt Latch or Throw Latch. (Cylinder lock and key sets available at additional cost).

GANG SHOWER STALLS



gang shower stall compartments are supplied in our TYPE XLFH. For details of construction and specifications, see page 4. Shower basin or Concrete curbs to be furnished and installed by others. This type of installation is recommended for industrial plants, schools, gymnasiums, etc. because of its simplicity in keeping sanitary, resulting in low maintenance cost. Curtain carriers, curtains and curtain rods available at additional cost.

SELF CONTAINED SHOWER UNITS



self contained shower cabinets are available in single and multiple units with or without dressing room facilities. This shower cabinet is made of extra heavy gauge Bonderized-Galvanized steel. Rounded corners, deluxe trim are standard. Finish in two coat lustrous baked enamel as selected, complete with chrome plated trim and accessories. Glass and Plastik-Fold doors are available for this model as optional extras. Sizes are 30" x 30" x 80", 32" x 32" x 80" and 36" x 36" x 80". Choice of four receptors.

Metpar QUALITY STEEL PRODUCTS

Metpar Toilet Compartments are a high quality product designed and developed by engineers who have had many years of manufacturing and field experience. It is a product made up of the best materials available and produced by competent skilled craftsmen.

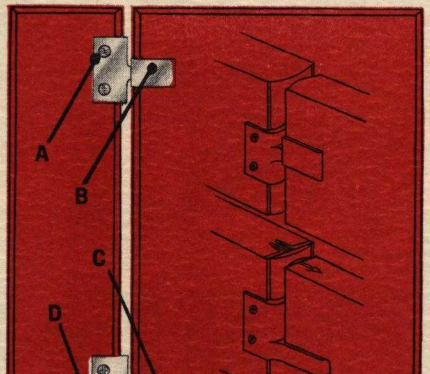
Metpar Toilet Compartments have been installed in many of the large schools, hospitals, office and commercial buildings throughout the country and have been commended by some of the leading Architects and Construction firms for QUALITY, DESIGN and SERVICE. Your inquiries to either the Home Office or the nearest field representative will receive prompt attention.

A WORD ABOUT ENAMEL FINISHES

Metpar Toilet Compartments are available in a wide selection of 24 pleasing colors and may be had in any combination of colors where a two tone effect is desired between doors and pilasters. Special match finishes are available at slight additional cost.

Write for our Color Selector Chart which shows actual colors available.

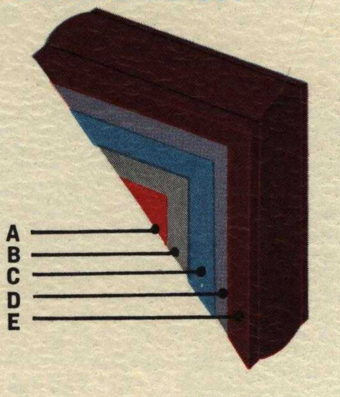
Concealed Hinges



- **A** • Top hinge bracket with bronze bearing, self lubricating.
- **B** • Chrome closure cup conceals unsightly opening without causing door to bind.
- **C** • Gravity hinge assembly concealed within door, operating on Bronze Bearing. Self-lubricating.
- **D** • Bottom hinge bracket . . . heavy non-ferrous casting. Chrome plated.

Bonderized-Galvanized Steel

The ABC's of
- **LONGER WEAR**
- **BETTER SERVICE**
- **LASTING BEAUTY**



- **A** • Cold rolled copper bearing steel.
- **B** • Smooth galvanized coating.
- **C** • Bonderized for adhesion and rust resistance.
- **D** • Baked rust-resistant primer.
- **E** • **TWO** coats of finish color baked on high baking formula synthetic enamel.

General Specifications

APPLICABLE TO ALL TYPES

MATERIAL:

STEEL: BONDERIZED GALVANIZED, if specified by Architect, otherwise cold rolled, copper bearing furniture steel will be furnished. All steel stretcher leveled.

GAGES:

Partitions	#20 Gage
Doors	#20 Gage
Pilasters (Type FP-500)	#20 Gage
Pilasters (Type CH-700 & FT-700)	#16 Gage
Oval Locking Moulding (Partitions & Doors)	#20 Gage
Oval Locking Moulding (Pilasters)	#18 Gage
Headrail (Type FP-500)	#18 Gage
Concealed Reinforcements	#12 Gage

CORES: STRUCTURAL HONEYCOMB, Cellular boards faced with Kraft and SOUND DEADENED to fill entire interior area of partitions, doors and pilasters.

CONSTRUCTION:

PARTITIONS & DOORS: are 1″ thick constructed of two sheets of formed steel panels cemented to honeycomb core under pressure for 24 hours. This assembly is permanently locked under tension and sealed with drawn oval shaped interlocking moulding forming a solid, airtight, sound deadened FLUSH UNIT. All corners are mitred, welded by SPECIAL PROCESS and ground smooth forming a continuous edge moulding. DUE TO OUR SPECIAL WELDING PROCESS OUR PARTITIONS & DOORS CANNOT RACK OR TWIST OUT OF PLANE AND WILL REMAIN FLAT UNDER ANY UNUSUAL TORSIONAL STRESS.

PILASTER: are 1¼″ thick constructed of two sheets of formed steel panels cemented to honeycomb core under pressure for 24 hours. All pilasters are strengthened with concealed steel plates, internally welded to reinforce pilasters for hardware and partition connections and to RESIST EXCESSIVE VIBRATION caused by closing of doors.

HARDWARE: Non-Ferrous Chrome Plated

HINGES: All doors will be equipped with CONCEALED HINGES consisting of INTERNAL bottom gravity hinge assembly with hardened cam and ball bearing rollers of corrosion resisting steel; and self lubricating bronze bearings.
The top hinge will be set in a cut out near the top of door. This cut out will be internally reinforced and CONCEALED with a chrome plated hinge casing which will be the same thickness as the door. Hinges will NOT PROJECT above or below the edges of door.

Miscellaneous: Each door will be furnished with a SLIDE LATCH (non-vibrating), STRIKE, KEEPER with live rubber bumper and clamp flanges, COAT HOOK, rubber tipped for inswinging doors and double pronged for outswinging doors. Outswinging doors to have cast chrome plated door pull.

General: Hinges are adjustable to allow doors to remain open at any desired position when unlatched or may be used double acting.
All hardware will be non-ferrous castings designed to withstand a great degree of stresses and strains with a high factor of safety. All hardware will have heavy polished chrome plated finish.

Fittings: Wall fittings will be furnished in heavy gage drawn steel, enameled same color as partitions. Polished chrome plated stirrup brackets are available at slight additional cost. Pilaster Plinths will be 3″ high of polished STAINLESS STEEL (Type 18-8).

Fastenings: All wall and pilaster stirrup brackets, hinge brackets, strikes and keepers will be THRU BOLTED with sex bolts having THEFT PROOF ONE WAY HEADS. All other hardware will be fastened with screws having similar ONE WAY HEADS. All exposed heads to be polished chrome plated.

FINISH: All metal will be thoroughly sanded, chemically degreased and will receive a RUST RESISTANT PRIMER followed by TWO finish coats of high baking formula synthetic enamel, each coat BAKED ON to a temperature of 400 degrees Fahrenheit.

Specific Specifications

APPLICABLE TO TYPES AS INDICATED

Type CH-700:

Pilasters are fastened to structural ceiling members (furnished by others) by means of two ⅜″ cadmium plated bolts with LOCK WASHERS and plate washers. Pilasters can be adjusted for leveling by means of the ⅜″ bolts and pilaster adjustment nuts. LOCK WASHERS USED THRU OUT TO PREVENT LOOSENING CAUSED BY VIBRATION. Bottom of doors are on same level with bottom of pilasters with NO PROTRUDING HARDWARE.

Type FT-700:

Pilasters are anchored to solid concrete sub floor by means of two ⅜″ cadmium plated bolts with expansion shields set two inches into solid concrete (not in fill). All nuts are locked with LOCK WASHERS to prevent loosening. Pilasters are adjustable for leveling similar to type CH-700. Top of doors are on same level with top of pilasters with NO HARDWARE PROTRUDING.

Type FP-500:

Pilasters are fastened to floor by means of two ¼″ bolts and expansion plugs set into finished floor. All bolts have LOCK WASHERS to prevent loosening. Headrail is furnished in continuous drawn tubular steel, threaded through the tops of pilasters which are internally reinforced with CONCEALED #12 gage welded channels.

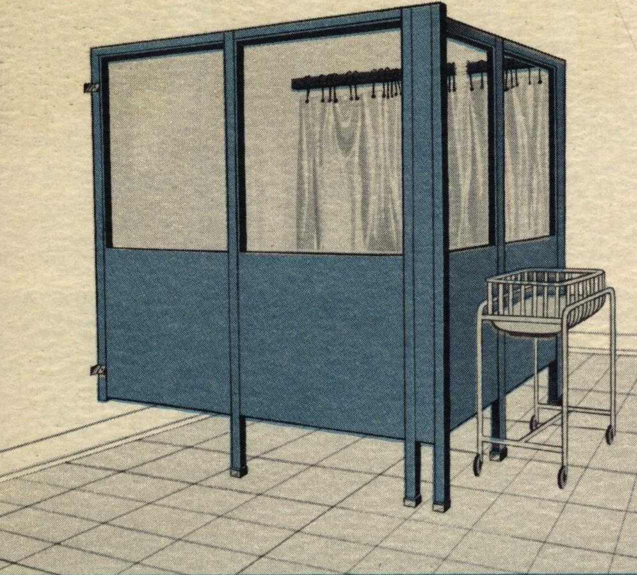
Type F-134 Hospital Cubicles



FULL FLUSH PARTITIONS 1¾" THICK with posts of the same thickness separated only by a hairline joint. There are no recesses or projections in the F-134 partition which eliminates unsanitary dust and dirt pockets. Cleaning of these partitions can be accomplished with ease and thoroughness.

THE F-134 HOSPITAL CUBICLE is constructed of two sheets of #20 gage steel cemented under pressure to a 10 ply sound deadened core and permanently sealed into one solid sanitary unit. These cubicles may be dismantled and rearranged simply and quickly at any time to meet changing hospital requirements.

HOSPITAL CUBICLE PARTITIONS are available in many sizes and arrangements including free standing nursery cubicles. We suggest you write to us for complete details and technical information.

PREFABRICATED SHOWER CABINETS

WALLS: Double wall BONDERIZED GALVANIZED #20 gage steel cemented to sound deadening core under pressure, to form flush panels 1" thick. All panels interlock into water tight, leak proof, recesses without the use of screws.

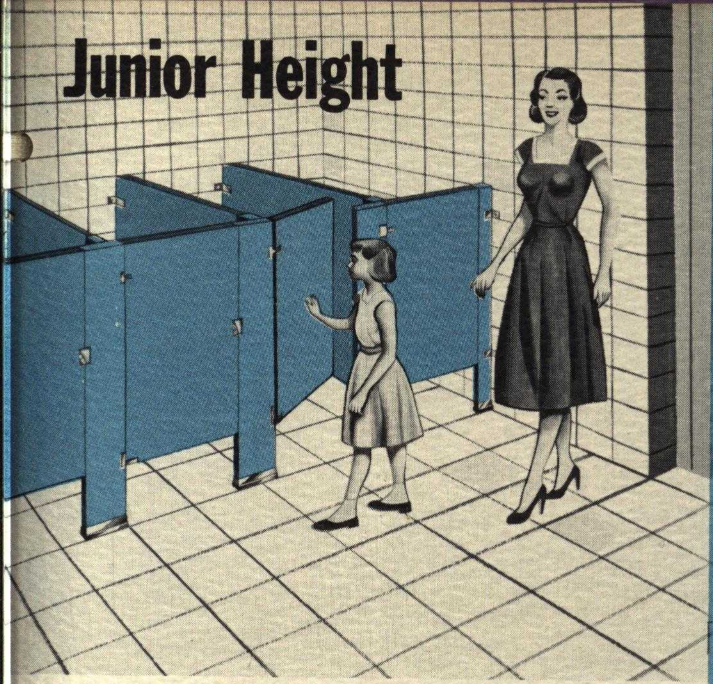
RECEPTOR: Precast terrazzo, black and white (other colors available) with integral cast brass drain and removable strainer. Two inch drain connector by plumber.

ACCESSORIES: CURTAIN, 8 oz. white duck with brass chrome curtain hooks and brass chrome rod. SOAP DISH, brass chrome plated with concealed fastening. Shower head and mixing valves furnished by others.

SIZES: 30"x30", 32"x32", 36"x36" all 82" high. Special sizes are available.

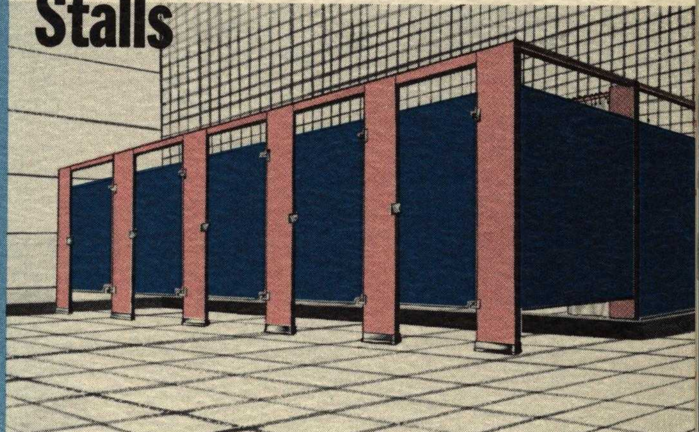
FINISH: Cabinet walls sanded and degreased. Rust resistant prime coat and two finish coats, each baked on. Available in any one of our 24 standard colors.

Junior Height



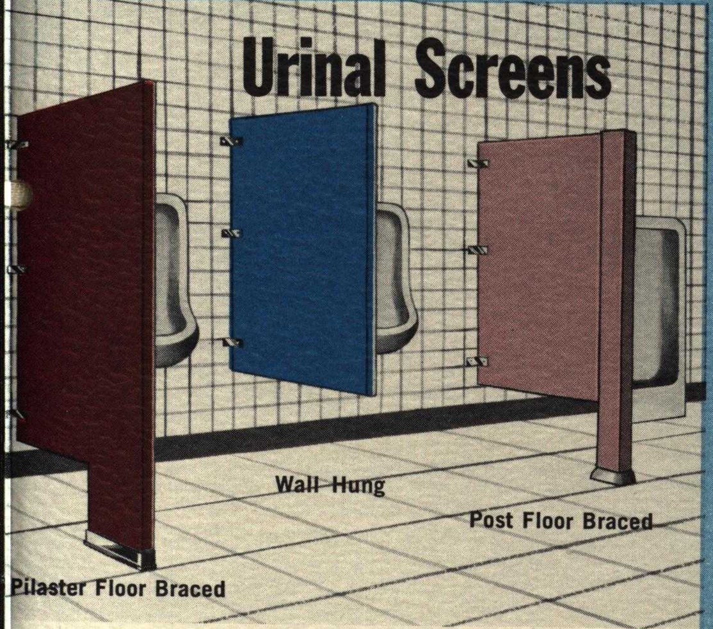
JUNIOR HEIGHT PARTITIONS are constructed of our Type FT-700 compartments. Partitions and doors are set 12″ off the floor and 42″ or 48″ high, making an overall height of 54″ or 60″. These heights allow adult supervision.

Shower & Dressing Stalls



SHOWER & DRESSING STALLS are constructed of our Type FP-500 partitions. Dressing Stalls are available with doors or curtains. Seats may be had in enameled steel or varnished hardwood. Standard Dressing Stalls are from 30″ to 48″ wide by 36″ to 48″ deep. Special sizes and layouts are available without additional cost.

Urinal Screens



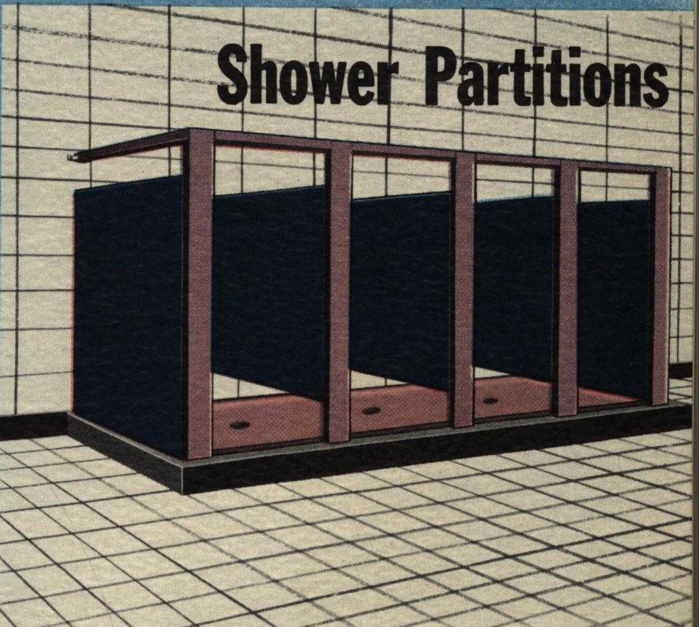
URINAL SCREENS are available in standard types, as illustrated, and in special designs and sizes.

Pilaster Floor Braced Screens are of Type FT-700 construction, 1¼″ thick, 30″ maximum width, set 12″ off floor and 58″ high.

Wall Hung Screens are 1″ thick, 28″ maximum width, height 36″ to 58″.

Post Floor Braced Screens are 1″ thick with 1¾″ square front post. Maximum width 30″, set 12″ off floor and 42″ to 58″ high.

Shower Partitions



SHOWER PARTITIONS are constructed of our Type FP-500, set on built-in tile curbs and fastened to tile walls. Available with curtains if desired. Sizes are furnished to suit job conditions or any variety of shower curb layouts.

MILLS METAL TOILET COMPARTMENTS

Hospital Cubicles • Showers • Dressing Rooms

MILLS METAL COMPARTMENT CO.

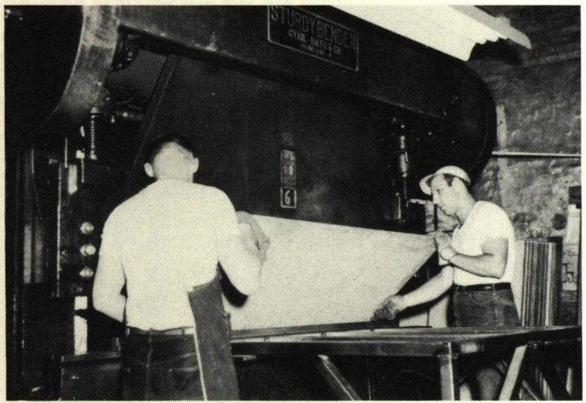
Division of The Mills Company
965 Wayside Road • Cleveland 10, Ohio

Mills background and facilities

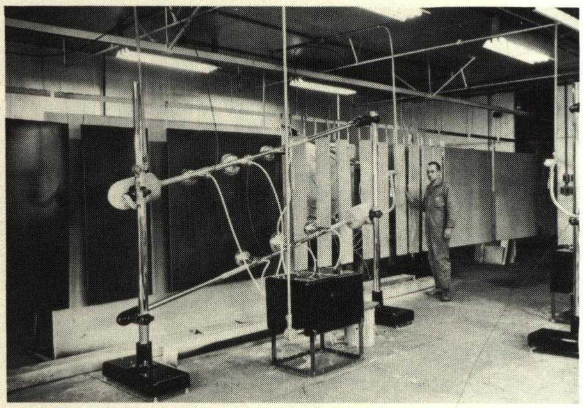
MILLS EXCLUSIVE POSITION IN THE INDUSTRY—Since its incorporation in 1921, The Mills Company has devoted itself solely to the design and manufacture of metal toilet compartments and movable office partitions. As the only full-line manufacturer of both types, Mills engineering skill, construction experience and craftsmanship have made it the focal point for fine quality in both fields. Only Mills can coordinate all partition requirements for a building.

COMPLETE ENGINEERING SERVICE—When you specify Mills Metal Toilet Compartments you get a complete, responsible service, including every requisite—initial layout, comprehensive detailed approved drawings, accurate fabrication and assembly and visual erection instructions—for final installation cooordinated with your building or remodeling schedule.

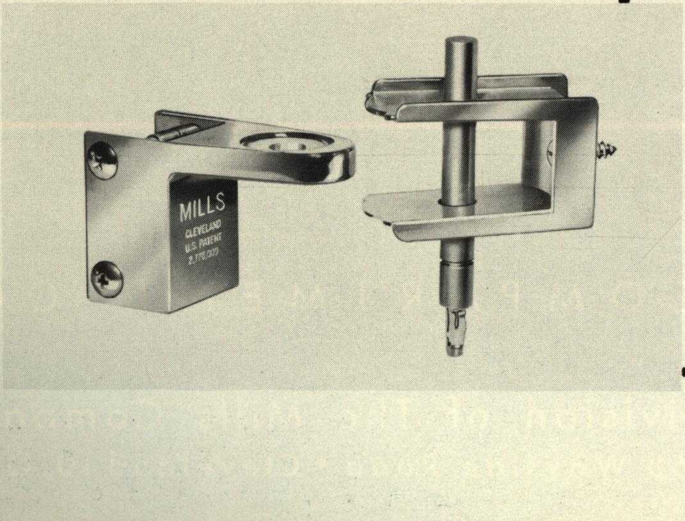
MANUFACTURING FACILITIES—With the increased demand for Mills Metal Toilet Compartments and allied lines, The Mills Company, in 1953, transferred their entire production facilities for these products to a newly-acquired plant in Upper Sandusky, Ohio. This plant has since been enlarged four times. The newest, modern, mechanized manufacturing processes are employed, increasing production and efficiency and raising Mills already high standards of quality.



Modern steel forming equipment accurately and quickly shapes Mills patented door units.



New, completely automatic, electro-static spray finishing equipment provides the finest uniform finish.



the mills name on each installation is a symbol of experienced engineering, fine craftsmanship and progressive development.

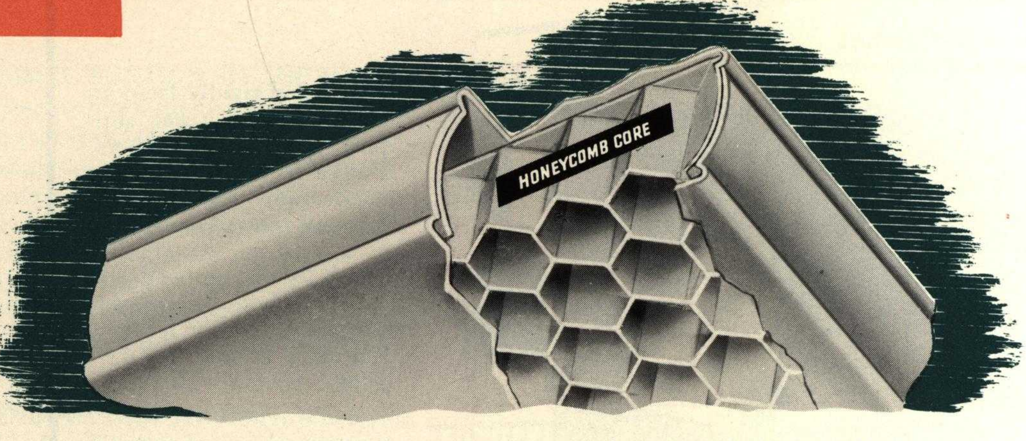
panels and doors

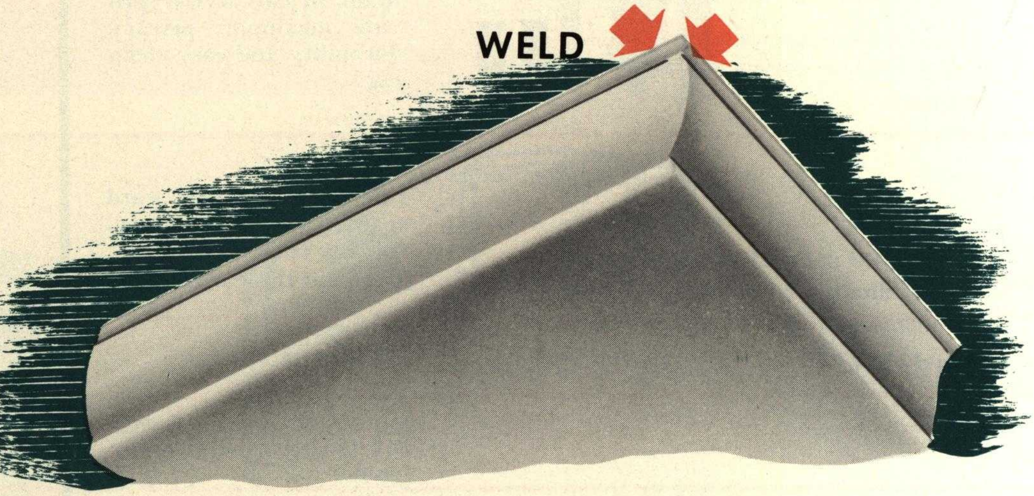


INTEGRAL INTERLOCKING DESIGN—This exclusive Mills feature is protected by U.S. Patent No. 2776029. As illustrated above, the two facing sheets of all Mills panels and doors are formed to interlock integrally around the entire perimeter. This provides a smooth permanent edge on all four ends. On a standard-sized panel over 400 square inches of steel are forced together under pressure in direct surface contact to create a permanent, high-tension interlock, producing units that are more hygenic, rigid and durable.

On panels and doors this structural assembly of twenty-gauge steel is internally bonded with moisture-proof aircraft adhesive to a honeycomb core. At all points where hinges are to be mounted, doors are reinforced with heavy-gauge steel, welded to Mills extra-heavy door sheets.

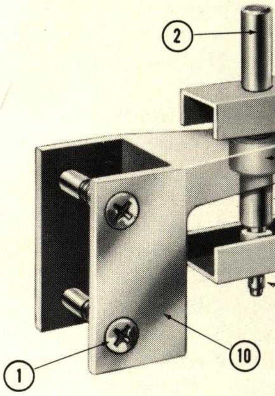
The four corners of Mills panels and doors are neatly welded and finished. Precision shearing and forming assures a trim, curved-in meeting of the two sides on the tops, bottoms and ends, and no raw edges are exposed.

Mills organic design minimizes maintenance created by undesirable extra lines around perimeters of panels and doors and eliminates separate loose-fitting moldings and wracking of doors caused by mitered weld failures.

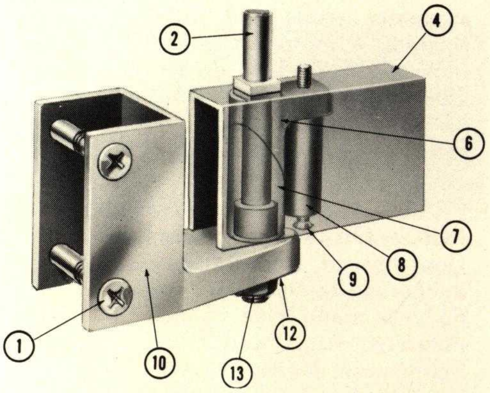


new T-100 AND T-200 series hinges

TOP HINGE—MULTIPLE SUPPORT FOR MULTIPLE LIFE—Mills top hinge pivot, mounted in a cutout near the top of the door, is a sturdy stainless steel pintle, rigidly supported at three points and locked to a channel reinforcement, welded to the inside of the door. Suspension arm of the hinge bracket rides on this shaft, protected by a pressure-fitted life-time Molybdenum Nylon bushing.

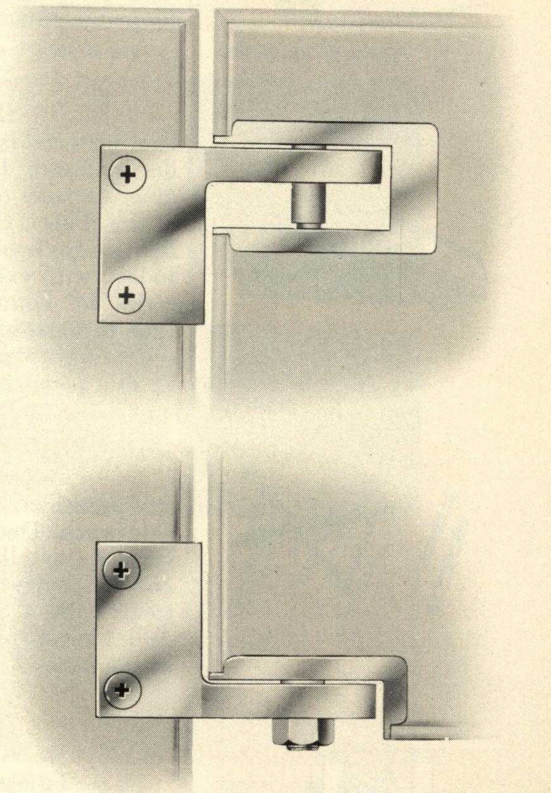


1. Through bolted studs and Phillips head sex nuts.
2. Stainless steel pintle.
3. 16 gauge welded reinforcement.
4. 14 gauge welded reinforcement.
5. Molybdenum Nylon bushing.
6. Molybdenum Nylon follower.
7. Nylon bottom cam.
8. Spacer screw.
9. Machine screw.
10. Cast alloy non-ferrous chrome plated hinge bracket.
11. Tubular snap clip.
12. Lock washer.
13. Adjusting nut.



LOWER HINGE — CONCEALED CAM AND FOLLOWER—Mills lower hinge is true gravity-type, adjustable, factory-installed and concealed within the door. Top follower is square-locked and secured to a welded steel reinforcement. Lower cam is molded to a knurled, hardened stainless steel shaft that axially aligns the cam and follower. The lower cam is firmly held by an adjusting nut to the lower hinge bracket, allowing door position at rest to be set at any point within the door arc. Both top follower and bottom cam are naturally-lubricated, life-time Molybdenum Nylon.

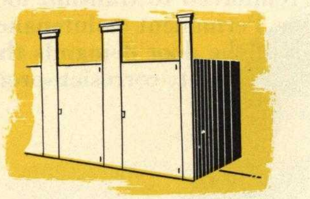
THE ESSENTIALS FOR A PERMANENT INSTALLATION—More than any other component of a metal compartment, the door and its hardware are normally subjected to the greatest abuse. Permanent alignment of the door requires that hinges be designed and installed to withstand eccentric forces and that the door be reinforced to transmit local strain over a broad area. Permanent maintenance-free, smooth operation of the door demands that hinges be strong, wear resistant, corrosion-proof, and adjustable.



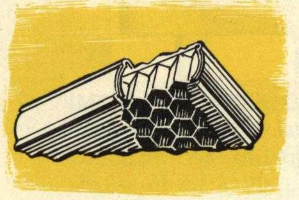
QUALITY FEATURES—All exposed parts of Mills top and bottom hinges are either stainless steel or non-ferrous, polished chrome plated. All working parts are stainless steel or corrosion-proof Nylon. Dupont Nylon, heat resistant and low in frictional coefficience, is now specified for thousands of commercial and industrial products, including gears and friction bearing surfaces of all types. Mills application of Nylon to a cam-to-follower true gravity hinge eliminates miniature metal cams, rollers and bearings, and springs that have a tendency to set, lose their tension and require periodic adjustment. The Mills hinge with nylon bearings has been test-run for over 300,000 cycles without measurable indication of wear.

important information

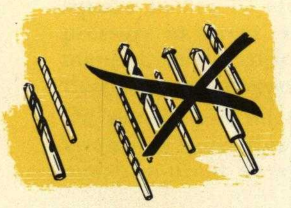
mills services and features of mills compartments



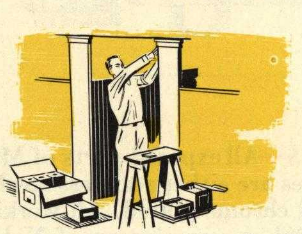
1. FLUSH CONSTRUCTION Mills discontinued the manufacture of inferior single sheet panel compartments over fifteen years ago, and has been the leader in furnishing flush, insulated-type compartments, exclusively.



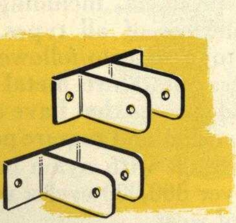
2. HONEYCOMB CORE INSULATION— Honeycomb core material is bonded under pressure between the inner surfaces of each panel facing. This is the strongest, lightweight insulation in use today, with excellent properties for sound attentuation, thermal insulation and resistance to moisture and vermin penetration.



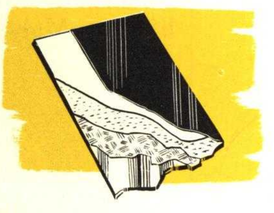
3. THOROUGH FABRICATION— Compartment fronts are predrilled to minimize field work. Door hinges are factory installed. Fittings and fastenings are standardized, with a minimum of drill changes required during installation.



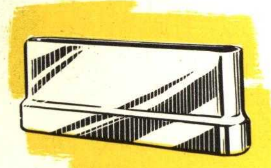
4. PACKAGED HARDWARE & ERECTION INSTRUCTIONS— To speed erection and minimize losses, Mills packages hardware and includes complete, visual erection instructions with each installation. Fittings and fastenings are illustrated to save erection time.



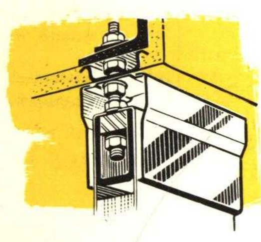
5. NON-FERROUS FITTINGS —Major components of all compartments are assembled and connected to the wall with polished, non-ferrous fittings. This guarantees extended life to the installation, eliminates costly maintenance and ensures lasting beauty. (Chrome plated, per government specifications.)



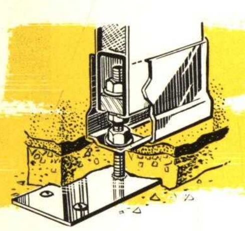
6. GALVANIZING AND BONDERIZING— Mills furnishes only galvanized-bonderized sheet steel exclusively for baked-on enamel installations. Mills steel is heavier. Compare it with others. G. B. Steel is Standard. No additional cost.



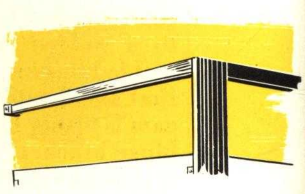
7. STAINLESS STEEL SHOE TRIM— For all compartment fronts, Mills provides a .031 gauge, 3″ stainless steel shoe (Type 302, polished) that snaps rigidly into place, held by concealed retainer clips. Surface damage to fronts caused by old-type one-piece shoes is eliminated.



8. CEILING-HUNG SUPPORT— On ceiling hung installations, Mills fronts are securely anchored to structural channels with 3/8 inch diameter studs and nuts, forming a foolproof micro-adjustable leveling device. Plaster key channels furnished without charge on request.



9. FLOOR-BRACED SUPPORT— On Marblmetal floor-braced installations, anchorage to solid concrete floors is made with 3/8 inch diameter studs and nuts. Screw-jack device provides positive close leveling. Floor plates, when needed are furnished at no extra charge.



10. FINEST, MOST RIGID HEADRAIL— Mills headrail is a 1″ x 1¾″ rolled section. Its 18 gauge steel is heaviest in the industry. Sentinel headrail is threaded through top of compartment front and bears on 16 gauge concealed reinforcement channel.

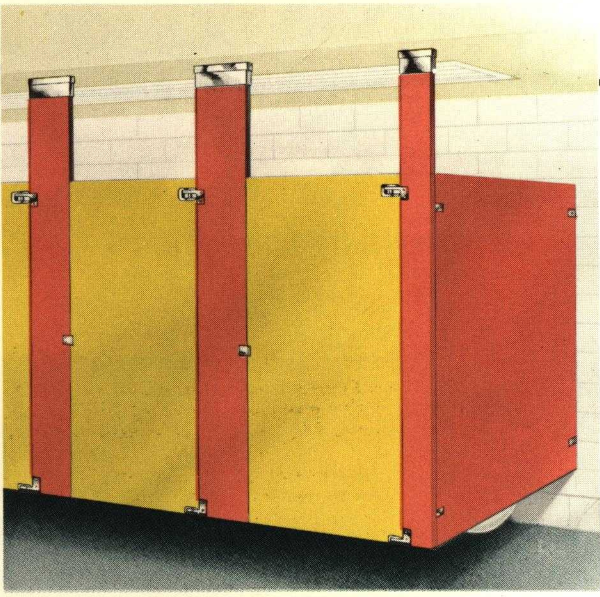
NOTE: Matching a color in porcelain enamel with the same color in baked-on synthetic enamel gives a noticeable contrast because the porcelain enamel has a greater depth and brilliance than the color of baked-on synthetic enamel.

Choice of a standard color speeds delivery. Because responsible manufacturers of synthetic enamels and porcelain frit retain the privilege of reasonable color variation, we cannot, therefore guarantee the exact matching of colors.

When ordering black or white specify Black No. M-250, White No. M-750. (Extra charge involved.)

Two colors, per order, may be chosen from this chart at no extra charge. Three or more colors require special pricing.

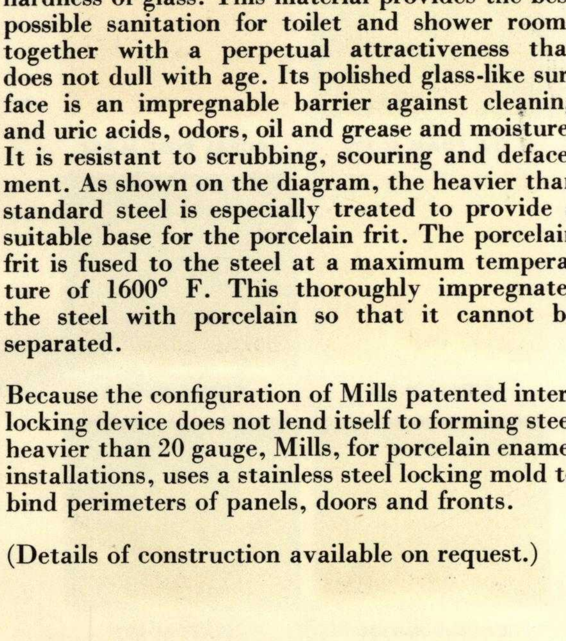
porcelain enamel



Mills Porcelain Enamel finish effectively combines the desirable qualities of the inherent structural strength of steel with the polished flint-like hardness of glass. This material provides the best possible sanitation for toilet and shower rooms together with a perpetual attractiveness that does not dull with age. Its polished glass-like surface is an impregnable barrier against cleaning and uric acids, odors, oil and grease and moisture. It is resistant to scrubbing, scouring and defacement. As shown on the diagram, the heavier than standard steel is especially treated to provide a suitable base for the porcelain frit. The porcelain frit is fused to the steel at a maximum temperature of 1600° F. This thoroughly impregnates the steel with porcelain so that it cannot be separated.

Because the configuration of Mills patented interlocking device does not lend itself to forming steel heavier than 20 gauge, Mills, for porcelain enamel installations, uses a stainless steel locking mold to bind perimeters of panels, doors and fronts.

(Details of construction available on request.)



Specifications

(Specify whether MARBLMETAL CEILING HUNG, MARBLMETAL FLOOR BRACED, or SENTINEL).

NOT AVAILABLE FOR METAL FLUSH.

1. **ALL METAL COMPARTMENTS** — for toilet, shower and dressing rooms shall be Mills (specify type) (vitreous porcelain enamel on steel in accordance with Porcelain Enamel Institute standards for architectural porcelain enamel), as manufactured by Mills Metal Compartment Company, Upper Sandusky, Ohio. Panels, fronts and doors shall be flush construction.

2. **STEEL SPECIFICATIONS** — All panels and doors shall be 18 gauge porcelain enameling iron. Fronts shall be 16 gauge porcelain enameling iron. Edge locking mold shall be stainless steel, welded and finish-ground at corners. Headrail shall be 1″ x $1\frac{3}{4}$″ 18 gauge stainless steel. Structural steel for support of ceiling hung installations shall be provided (fabricated for compartment attachment) and installed by others.

3. **PANELS, DOORS AND FRONTS**—shall be made of two edgeformed steel sheets, spaced and insulated with honeycomb core, cemented under pressure to the inner surfaces with waterproof adhesives. Edges shall be bound and interlocked with stainless steel moldings, welded and finish-ground at corners. Finished thickness of doors and panels shall be 1″; finished thickness of fronts shall be $1\frac{1}{4}$″.

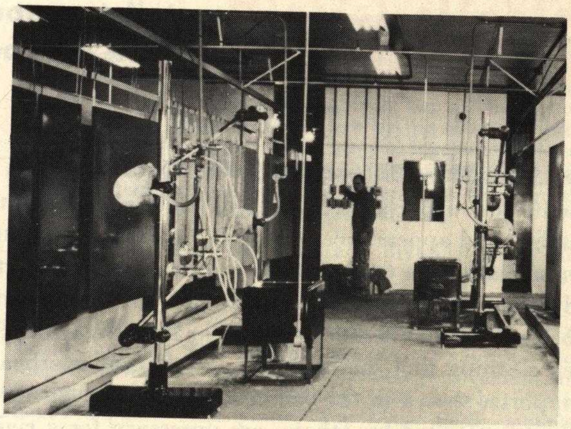
4. **HARDWARE AND FITTINGS** — Doors shall be hung on Mills standard gravity hinges. Lower hinge shall be concealed within the door; upper hinge shall provide three-point support and be mounted in cutout near top of door. Doors shall be fitted with slide bar latch, combination keeper and bumper and rubber-tipped combination coat hook and bumper, all to be non-ferrous chrome-plated. Latches and coat hooks shall be attached with Phillips-head screws (one-way fastenings provided on request). Two-piece shoe and cap trim for fronts shall be .031 gauge stainless steel, 3 inches high. (Type 302, polished)

5. **FINISH**—Interior and exterior surfaces of panels, doors and fronts shall be vitreous porcelain enamel. In addition, all exposed surfaces shall be given a finish coat of vitreous porcelain enamel in one of 22 colors, chosen from Mills standard color chart.

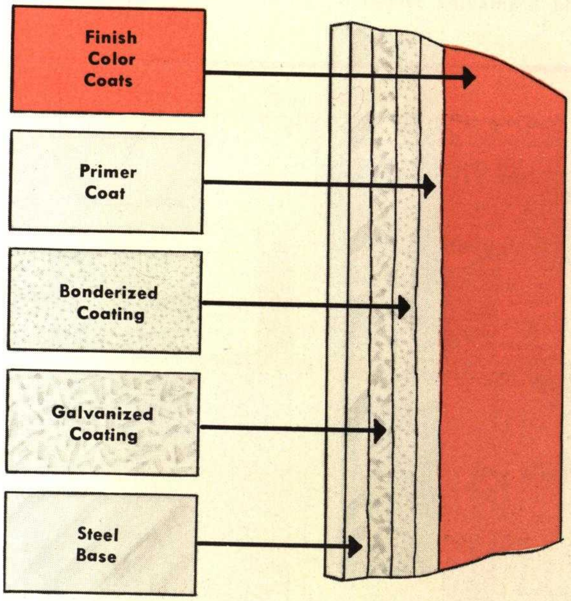
baked-on enamel

MILLS BAKED-ON ENAMEL—Mills produces the finest synthetic-enameled toilet compartments, with smooth, colorful, long-lasting finishes, at one-half to one-third the initial cost of any porcelain enamel installation.

Employing an automatic, conveyorized electrostatic spraying system of the latest design, Mills applies two coats of top-grade synthetic enamel over stretcher - leveled galvanized - Bonderized steel. This is the most modern coating system available and assures absolute uniformity of primer and finished color coats. The results: smooth, even surfaces and uniform oven baking for finishes surpassed only by porcelain enamel in appearance and longevity.



New conveyorized electro-static spray finishing equipment applies synthetic enamels to uniform thickness and bakes them to a hard marproof surface.



of the leading national manufacturers, only mills uses galvanized-bonderized sheet steel exclusively.

Mills has always furnished galvanized-Bonderized steel for unit showers and built-up shower and dressing enclosures. These compartment products are installed in areas of high humidity, and water is directly applied to their surfaces. Cold rolled steel can best withstand these adverse conditions only when protected by galvanizing and Bonderizing.

Toilet compartments are often erected in shower room areas, and these conditions apply to some extent in any compartment installation. For this reason, Mills has considered galvanized-Bonderized steel so important a feature that it established, in 1953, a policy of using steel sheets treated in this manner for all its toilet compartments, whether specifications called for it or not. Since that time Mills records prove that finish failures have been virtually eliminated.

compare the gauges of mills steel with that of others

For baked-on enamel compartments, Mills uses steel of these gauges:

	Marblmetal			
	Ceiling Hung	Floor Braced	Sentinel	Metal Flush
Panels	20 gauge	20 gauge	20 gauge	20 gauge
Fronts	16 gauge	16 gauge	18 gauge	18 gauge—1¾″ posts
Doors	20 gauge	20 gauge	20 gauge	20 gauge
Headrail	. . . .	. . . .	18 gauge	18 gauge

marblmetal

ceiling hung

toilet compartments with no floor contact

MILLS MARBLMETAL—CEILING HUNG Compartments are expressly engineered for use where fine quality and appearance must be combined with minimum costs. They are designed to be rigidly supported from the ceiling. There are no connections or obstructions at the floor. The clear floor area simplifies cleaning and maintenance. Structural overhead supports, shown in the construction details, furnished and installed by others, are necessary for a rigid satisfactory installation.

engineered value features

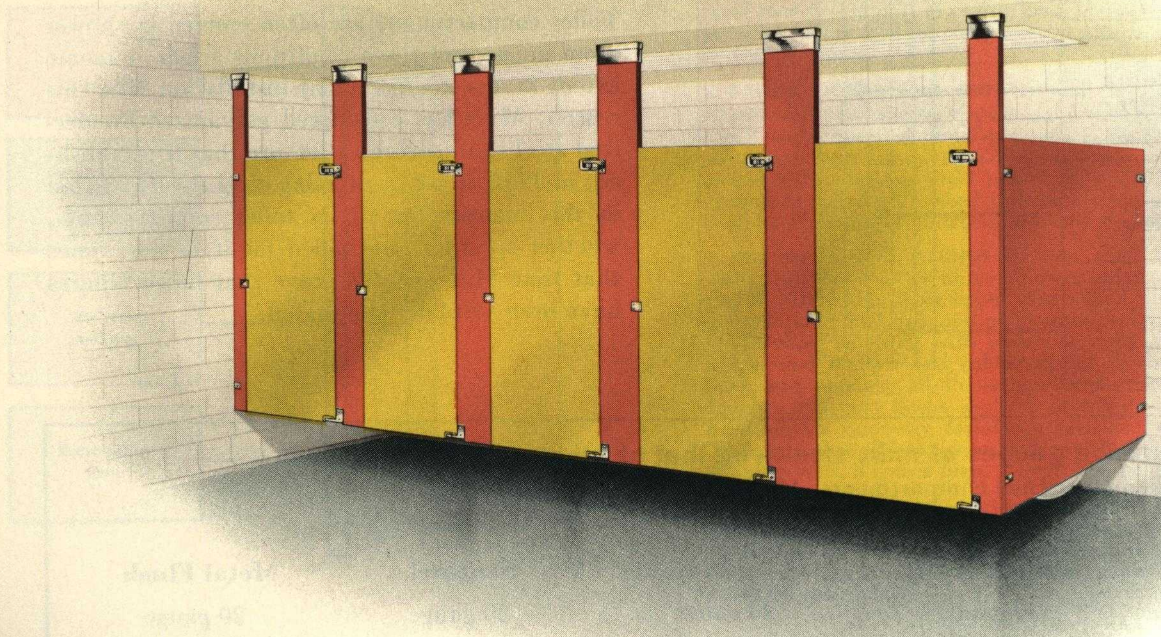
The smooth flush surfaces of ***MILLS MARBLMETAL CEILING HUNG*** Toilet Compartments are easy to clean. Moldings and hard to clean corners have been eliminated. Dividing panels hang clear of the wall. Each compartment weighs approximately 300 pounds. To achieve the full benefits of ceiling hung construction, the use of wall type closet bowls is recommended. Ceiling Hung Compartments are manufactured in a number of standard sizes. See Page 23.

materials and construction

The finest quality furniture steel, galvanized-Bonderized or porcelain enamel steel is used in the construction of ***MILLS MARBLMETAL—CEILING HUNG*** Toilet Compartments. All panels and doors are constructed with two sheets of steel permanently bonded to an insulating core and incorporating Mills exclusive integral interlocking design (Pat. No. 2776029), welded at the corners. Door hardware is non-ferrous, heavily chrome plated. For all fastenings see specifications on opposite page.

available in two finishes—many colors

For details see pages 7 to 9.



Specifications

GENERAL The Toilet compartments shall be ***MARBLMETAL—CEILING HUNG*** with no floor connections—bottom of fronts and doors flush as manufactured by The Mills Metal Compartment Co., Upper Sandusky, Ohio.

DIVIDING PANELS—Shall be flush, 1″ thick made of two sheets of 20 gauge furniture steel, spaced and insulated with honeycomb cemented under pressure to inner surface with waterproof binder. Edges of panel sheets shall be formed to interlock with each other, forming a sturdy, two-piece unit (Pat. No. 2776029), welded at the corners. Dividing panels to be anchored to fronts by "U" brackets.

DOORS Where shown on plans shall be flush 1″ thick and of same design and construction as specified for dividing partitions, and shall be rigid, free from distortion and reinforced for hardware.

FRONTS—Shall be flush 1¼″ thick, made of two sheets of 16 gauge steel, spaced and insulated with honeycomb filler cemented under pressure to the inner surfaces for 24 hours with a waterproof binder. The sides and bottom edges shall be bound and interlocked with 18 gauge rolled steel molding welded at bottom corners. The top edge shall be prepared for ceiling connections and be reinforced with 12 guage channel securely arc welded to a leveling cross bar ½″ by ⅞″.

CEILING CONNECTIONS—Suitable provision for supporting these stalls is to be incorporated in the ceiling design by the general contractor. Recommended floor to finished ceiling height over these stalls to be 7′6″. The front stiles shall be anchored to ceiling support with a device, integrally welded near the ceiling line, and designed to transmit strain of lateral thrust to ceiling support through two ⅜″ diameter galvanized bolts with lock nuts and washers which penetrate down through the finish plaster from ceiling support. These ⅜″ diameter bolts to project down to form a screw leveling device to which is attached the ½″ x ⅞″ leveling cross bar at the top of the stile, which in turn is held in place by use of a lock nut over ceiling anchoring device after proper leveling. The ceiling anchoring device shall be covered with a 3″ high polished stainless steel cap and shall be fastened to the top of the front stile to give a finished appearance.

WALL CONNECTIONS—All front and dividing panels shall be fastened to masonry walls with wall "U" brackets to hold panel away from wall approximately 1″.

DOOR HARDWARE—Non-ferrous heavily chrome plated. Doors shall be hung on Mills standard gravity-type hinges. Bottom hinge shall have Nylon cam and follower construction, and be concealed within the door, both matched parts be aligned by heavy stainless steel pintle. Top hinge to be mounted in cutout near top of door and operating on stainless steel pintle within a Nylon bushing. Each door to be equipped with Mills standard slide latch, keeper and bumper, and combination coat hook and bumper.

FASTENINGS—Hinges, keeper and latch to be applied with Phillips head sex nuts and studs. (One way fastenings available when specified). Combination coat hook and bumper applied with one way metal screws.

FINISH—All material to be completely finished. Material shall be galvanized-Bonderized furniture steel, given a prime coat and a finish coat of high grade synthetic enamel and oven-baked to produce a highly mar-resistent surface.

For porcelain enamel finish see page 8.

marblmetal

floor braced

the finest quality toilet compartment

Smoothly streamlined, in keeping with the best in modern architecture and interior design, **MILLS MARBLMETAL FLOOR BRACED** Toilet Compartment are ideally suited for apartment buildings, office buildings, clubs, etc. All unnecessary lines are eliminated, no overhead bracing is required. The result is a simplified design that is both attractive and sanitary.

engineered value features

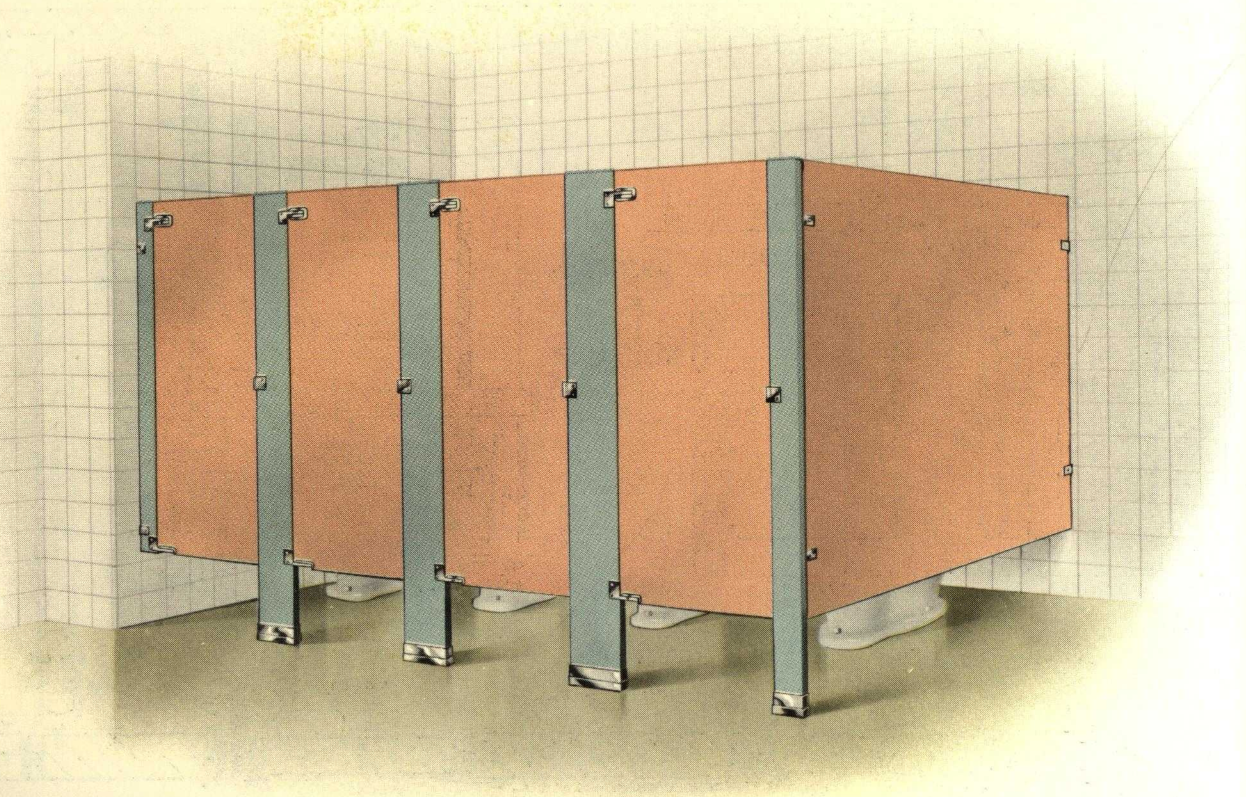
MILLS MARBLMETAL—FLOOR BRACED Toilet Compartments can be easily and speedily erected. They are secured to the floor with 3/8 in. diameter anchor bolts having at least 2 in. penetration into the floor slab. Floor connections are concealed by an attractive pilaster trim 3 in. high. Panels, doors and fronts are available in a number of standard sizes. For list of standard sizes, see Page 23.

materials and construction

MARBLMETAL — FLOOR BRACED Toilet Compartments are constructed of the finest quality galvanized-Bonderized furniture steel, or porcelain enamel steel. Panel and door sheets are permanently bonded to a honeycomb core and incorporate Mills exclusive integral interlocking design (Pat. No. 2776029), welded at corners. All hardware is nonforrous, heavily chrome plated. For fastenings see specifications on opposite page.

available in two finishes—many colors

For details, see pages 7 to 9.



Specifications

GENERAL The toilet compartments shall be ***MARBLMETAL—FLOOR BRACED***—with top of doors and fronts flush and no overhead bracing, as manufactured by The Mills Metal Compartment Co., Upper Sandusky, Ohio.

DIVIDING PANELS—Shall be flush, 1″ thick made of two sheets of 20 gauge furniture steel, spaced and insulated with honeycomb core, cemented under pressure to inner surface with waterproof rust inhibiting binder. Edges of panel sheets shall be formed to interlock with each other, forming a sturdy, two-piece unit (Pat. No. 2776029), welded at the corners. Dividing panels to be anchored to fronts by "U" brackets.

DOORS—Where shown on plans shall be flush 1″ thick and of same design and construction as specified for dividing partitions, and shall be rigid, free from distortion and reinforced for hardware.

FRONTS—Shall be flush 1¼″ thick, made of two sheets of 16 guage steel, spaced and insulated with honeycomb core cemented under pressure to the inner surfaces for 24 hours with a water proof binder. The sides and top edge shall be bound and interlocked with 18 gauge rolled steel moldings welded at top corners. The bottom edge shall be prepared for floor connections and be reinforced with 12 gauge channels securely arc welded to a leveling cross bar of ½″ x ⅞″. Bottom edge of front adjacent to wall shall be flush with bottom of door, recommended width not to exceed 7″.

FLOOR CONNECTIONS—The fronts shall be fastened with an anchoring device, integrally welded near floor line, and designed to transmit strain of lateral thrust to floor construction through two ⅜″ diameter galvanized bolts with expansion shields having at least 2″ penetration into the floor slab.

These ⅜″ diameter bolts to project up from floor to form a jack screw leveling device on which set the ½″ x ⅛″ leveling cross bar of the bottom of the stile, which in turn is held in place by use of a lock nut over floor anchor projections for proper leveling. The bottom of the floor anchoring device shall be covered with a 3″ high polished stainless steel base (that will act as a mop strip) and shall be fastened to bottom of the fronts to give a finished appearance.

When dry fill floor construction is used in place of solid concrete, specify: sub floor plate anchors, furnished by the partition contractor, installed by others on concrete slab BEFORE fill and finished floors are applied.

WALL CONNECTIONS—All front and dividing panels shall be fastened to masonry walls with wall "U" brackets to hold panel away from wall approximately 1″.

DOOR HARDWARE—Non-ferrous heavily chrome plated. Doors shall be hung on Mills standard gravity-type hinges. Bottom hinge shall have Nylon cam and follower construction, and be concealed within the door, both matched parts to be aligned by heavy stainless steel pintle. Top hinge to be mounted in cutout near top of door and operating on stainless steel pintle within a Nylon bushing, Each door to be equipped with Mills standard slide latch, keeper and bumper, and combination coat hook and bumper.

FASTENINGS—Hinges, keeper and latch to be applied with Phillips head sex nuts and studs. (One way fastenings available when specified). Combination coat hook and bumper applied with one way metal screws.

FINISH—All material to be completely finished. Material shall be galvanized-Bonderized furniture steel, given a prime coat and a finish coat of high grade synthetic enamel and oven-baked to produce a highly mar-resistant surface.

For porcelain enamel finish see page 8.

SELECTION OF FLOOR ATTACHMENT

TYPE 1 FLOOR PLATES

FLOOR CONSTRUCTION OF FINISHED FLOOR ON NON-SOLID UNDERBED ON CONCRETE SLAB REQUIRES STEEL FLOOR PLATES AND STUDS. MILLS WILL PROVIDE THESE PLATES FOR INSTALLATION BY OTHERS PRIOR TO APPLICATION OF UNDERBED AND FINISHED FLOOR.

TYPE 2 EXPANSION SHIELDS

ATTACHMENT TO SOLID CONCRETE FLOORS WILL BE WITH EXPANSION SHIELDS AND ⅜" DIA. STUDS.

sentinel

overhead braced

a quality compartment for many uses

MILLS SENTINEL Toilet Compartments are designed for use in public buildings, department stores, office buildings, clubs, hotels and schools where a strong compartment, able to withstand heavy usage is needed. Their general appearance is similar to **Mills Marblemetal Floor Braced** Compartments except that the pilasters extend approximately 12″ above the door tops to a continuous overhead brace. This provides a rigid installation on thin floors or where sub floor cannot hold the compartments rigid. Use of overhead braced construction is good engineering practice for permanent rigidity for entrance screens, alcove toilet stalls, etc.

engineered value features

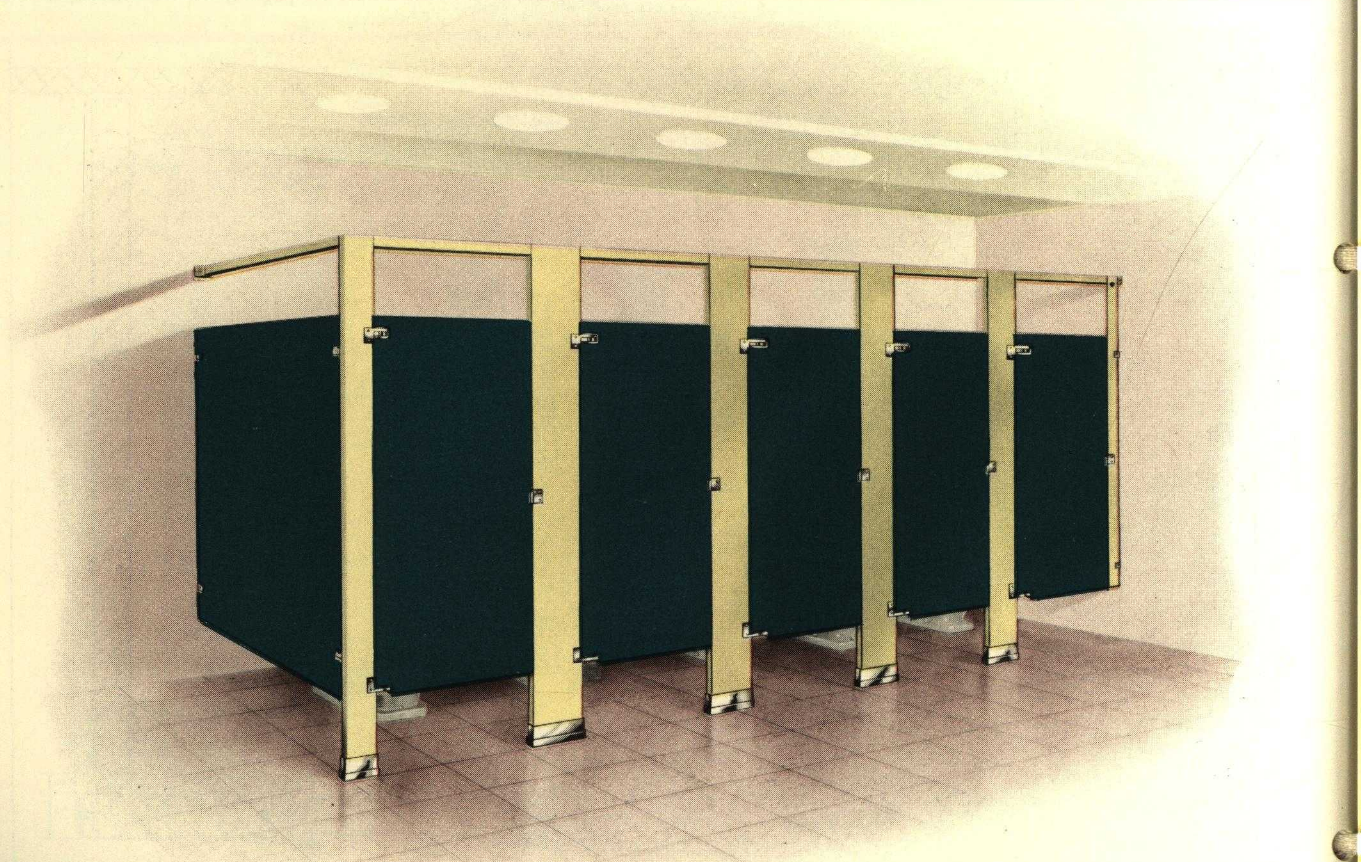
MILLS SENTINEL Compartments feature simple, prefabricated construction with self alignment features that make installation easy and economical. Their smooth flush surfaces are easy to clean, do not accumulate dust since all surfaces are flat without crevices. Panel, doors and fronts are manufactured in many standard sizes. See page 23.

materials and construction

MILLS SENTINEL — Compartments are constructed of the finest galvanized-Bonderized furniture steel or porcelain enamel steel. Sheets are permanently bonded to a honeycomb core and incorporate Mills exclusive integral, interlocking design (Pat. No. 2776029), welded at corners. The floor and headrail connections are concealed to enhance the streamlined appearance. All hardware is non-ferrous heavily chrome plated. For fastenings see specifications on opposite page.

available in two finishes—many colors

For details see pages 7 to 9.



specifications:

GENERAL—All Partitions, doors, entrance screens and dressing rooms shall be Mills **SENTINEL** as manufactured by Mills Metal Compartment Co., Upper Sandusky, Ohio.

DIVIDING PANELS—Shall be flush, 1″ thick made of two sheets of 20 gauge furniture steel, spaced and insulated with honeycomb core, cemented under pressure to inner surface with waterproof rust-inhibiting binder. Edges of panel sheets shall be formed to interlock with each other, forming a sturdy, two-piece unit (Pat. No. 2776029), welded at the corners. Dividing panels to be anchored to fronts by "U" brackets.

DOORS—Where shown on plans shall be flush 1″ thick and of same design and construction as specified for dividing partitions, and shall be rigid, free from distortion and reinforced for hardware.

FRONTS—Shall be flush 1¼″ thick made of two sheets of 18 gauge furniture steel, spaced and insulated with honeycomb core cemented under pressure with waterproof, rust-inhibiting binder. Edges of panel sheets are formed to interlock with each other forming a sturdy two piece unit (Pat. No. 2776029), welded at the corners. Botton edge of fronts adjacent to wall shall be flush with bottom of door, recommended width not to exceed 7″.

FLOOR CONNECTIONS—The fronts shall be fastened to the floor by fitting over a 16 gauge internal floor channel. This channel shall be fastened to the floor with two connections and permit the fronts to have vertical adjustment for uneven floors. The floor channel and bottom of front shall be covered with a 3″ high polished stainless steel base (which will act as a mop strip) and shall be fastened to the bottom of the fronts to give a finished appearance.

TOP BRACING—Rectangular headrail, 18 gauge, 1″ x 1¾″ shall thread through top of all fronts and fasten by means of sheet metal screws.

WALL CONNECTIONS—All front and dividing panels shall be fastened to masonry walls with wall "U" brackets to hold panel away from wall approximately 1″.

DOOR HARDWARE—Non-ferrous heavily chrome plated. Doors shall be hung on Mills standard gravity-type hinges. Bottom hinge shall have Nylon cam and follower construction, and be concealed within the door, both matched parts to be aligned by heavy stainless steel pintle. Top hinge to be mounted in cutout near top of door and operating on stainless steel pintle within a Nylon bushing. Each door to be equipped with Mills standard slide latch, keeper and bumper, and combination coat hook and bumper.

FASTENINGS—Hinges, keeper and latch to be applied with Phillips head sex nuts and studs. (One way fastenings available when specified). Combination coat hook and bumper applied with one way metal screws.

FINISH—All material to be completely finished. Material shall be galvanized-Bonderized furniture steel, given a prime coat and a finish coat of high grade synthetic enamel and oven-baked to produce a highly mar-resistant surface.

For porcelain enamel finish see page 8.

metal flush

overhead braced

the 1″ thick toilet compartment

Designed for use as toilet compartments, cubicles and dressing rooms, **MILLS METAL FLUSH** Compartments are identified by their one inch thick panels and doors and Mills exclusive internal shoe floor mountings. Metal Flush can be used in any type of building.

engineered value features

METAL FLUSH panels are rigidly anchored to the floor by Mills exclusive internal rust proof shoe. The post fits down snugly over this shoe. There is no external shoe top and crevice to collect water. Easy to clean, the smooth, flush, baked-on enamel surfaces of Metal Flush compartments stay clean longer. This means materially lower maintenance.

METAL FLUSH doors can be used with marble partitions and their use modernizes the appearance of old toilet compartments and gives the added value of the sanitation and durability of metal.

METAL FLUSH panel and door units are available in many standard sizes, see page 23.

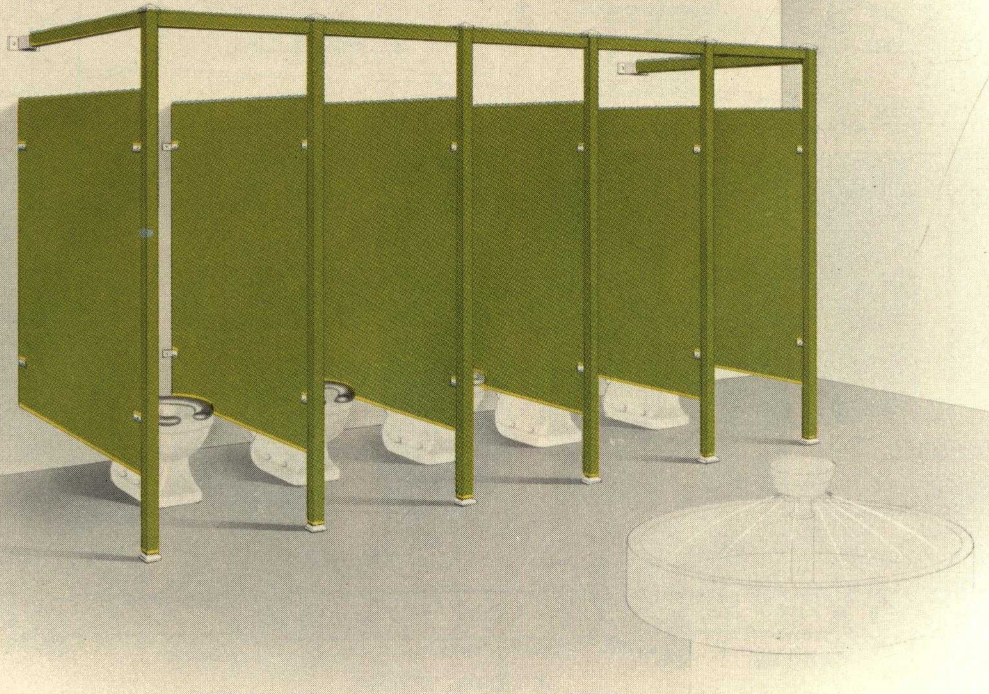
materials and construction

The finest quality galvanized-Bonderized furniture steel is used in the construction of **MILLS METAL FLUSH** compartments. All units are constructed of two sheets of steel permanently bonded in an insulating core and incorporating Mills exclusive integral interlocking design (Pat. No. 2776029), welded at the corners. Headrail threads through top of all posts and locks them in position by means of an ornamental post cap. **MILLS METAL FLUSH** hardware is heavy brass, chrome plated. For fastenings see specifications on opposite page.

baked-on enamel finish—many colors

For details, see pages 7 and 9.

(NOT AVAILABLE IN PORCELAIN FINISH)



metal flush

specifications:

GENERAL—All partitions, doors, entrance screens and dressing rooms shall be Mills **METAL FLUSH** as manufactured by Mills Metal Compartment Co., Upper Sandusky, Ohio.

PANELS AND POSTS—All panels shall be 1″ thick made of two sheets of 20 gauge furniture steel, spaced and insulated with a honeycomb core, cemented to the inside of the panel sheets with a rust-inhibiting binder. Edges of panel sheets shall be formed to interlock with each other, forming a sturdy two-piece unit (Pat. No. 2776029), welded at the corners. Panels shall be anchored to the posts by means of "U" brackets. Posts shall be 18 gauge, 1¾″ square of a sanitary design.

DOORS—Doors, where shown on plans, shall be 1″ thick and of the same design and construction as specified above for partition panels. Doors shall be rigid, free from distortion and reinforced for hardware. Maximum door width for compartments—32″.

TOP BRACING—Rectangular headrail, 18 gauge, 1″ x 1¾″ shall thread through the top of all posts and lock them in fixed position by means of a universal ornamental post cap.

FLOOR ATTACHMENT—Shall be by means of an **INTERNAL** rustproof shoe designed to permit adjustment for uneven floors and tightly fastened to the floor with concealed fastenings.

WALL CONNECTIONS—Shall be wall "U" brackets attached to the wall.

DOOR HARDWARE—Non-ferrous heavily chrome plated. Doors shall be hung on Mills standard gravity-type hinges. Bottom hinge shall have Nylon cam and follower construction, and be concealed within the door, both matched parts to be aligned by heavy stainless steel pintle. Top hinge to be mounted in cutout near top of door and operating on stainless steel pintle within a Nylon bushing. Each door to be equipped with Mills standard slide latch, keeper and bumper, and combination coat hook and bumper.

FASTENINGS—Hinges and keeper to be applied with Phillips head metal screws. Latch to be applied with Phillips head sex nuts and stud. (One way fastenings available when specified.) Combination coat hook and bumper applied with one way metal screws.

BACKS AND UTILITY SPACE—Backs against walls, enclosures for utility corridors or vent space shall be of single sheet construction. Vent tops and utility doors shall be of single sheet construction properly reinforced.

FINISH—All material to be completely finished. Material shall be galvanized-Bonderized furniture steel, given a prime coat and a finish coat of high grade synthetic enamel and oven-baked to produce a highly mar-resistant surface.

shower and dressing rooms

Careful choice of material for multiple shower unit and dressing room facilities for schools, swimming pools, motels, factories and similar buildings is important for many reasons. Appearance, cleanliness and good taste are important for public goodwill and employee morale. Durability and ease of maintenance have a definite effect on the overall year to year cost of the installation.

Meeting all the requirements of this type installation, **MILLS METAL FLUSH** material, forming a battery of shower stalls, with or without dressing rooms, is the finest material available. Mills exclusive internal rust-proof shoe floor connection gives an important advantage since these compartments are exposed to considerable amounts of water and steam and this Mills exclusive feature eliminates the usual pocket at top of shoe that accumulates water and increases the chances of corrosion.

SENTINEL fronts, as illustrated, may be used for the outer dressing room enclosure.

Shower compartments are furnished in corrosion resistant galvanized, Bonderized steel, finished in durable, baked-on-enamel in any of the colors shown on pages 7 to 9.

specifications:

GENERAL—All panels, and doors, if required, shall be Mills ***METAL FLUSH*** as manufactured by the Mills Metal Compartment Co., Upper Sandusky, Ohio. Shower basin, curb of terrazzo or concrete shall be furnished by others. Curb dimensions as suggested in adjacent detail.

PANELS AND POSTS—All panels shall be 1" thick made of two sheets of 20 gauge furniture steel, galvanized-Bonderized, spaced and insulated with a fibre filler cemented to the inside of the panels with a rust resisting binder. Edges of panel sheets are formed to interlock with each other forming a sturdy two piece unit, (Pat. No. 2776029), welded at the corners. Posts shall be 18 gauge, 1¾" square.

TOP BRACING—Rectangular headrail, 18 gauge, 1" x 1¾" shall thread through top of all posts and lock them in fixed position by means of a universal ornamental post cap.

FLOOR AND CURB ATTACHMENTS—Shall be by means of Mills exclusive INTERNAL rustproof connectors designed to permit adjustment for uneven floors and tightly fastened to the floor and curb with concealed fastenings.

WALL CONNECTIONS—Shall be stirrup brackets attached to the wall with bolts properly spaced to prevent breaking out.

FASTENINGS—All fastenings shall be Phillips head screws or one way when specified.

DOORS—Where required, doors shall be 1" thick and of the same design and construction as specified for panels.

**ACCESSORIES — **Shower heads, valve controls, soap dishes, curtains and seats to be supplied by others unless otherwise specified.

FINISH—All material shall be completely finished at the factory. Material shall be thoroughly cleaned, free from oil, given one coat of rust resistant primer, sprayed evenly with synthetic enamel and oven baked.

unit showers

Mills Unit Showers are absolutely watertight, leakproof self-contained units. Available in sizes 36" x 36" x 84" and 32" x 32" x 84". Shipped knocked down with receptors, curtain rods and rings with clear erection instructions.

Suggested shower and dressing room layout page 22.

specifications:

Receptors shall be black and white precast terrazzo with self-draining base and cast-in drain. 2" drain connector by others.

WALLS—1" thick 20 ga. galvanized-bonderized steel walls, spaced and insulated with sound-deadening filler cemented to inside panel sheets with rust-inhibiting binder. Braced at top by angle frame.

ACCESSORIES—Shower head, valve, controls, soap dishes and curtains can be supplied, type to be specified at additional cost.

FINISH—Walls cleaned, given one coat rust-resisting primer and finished in baked-on synthetc enamel. Color as selected from pages 7 and 9.

urinal screens

FLOOR BRACED — This screen provides maximum privacy. Construction details similar to Mills Marblmetal Floor Braced (See pages 12-13). Recommended where depth exceeds 24″ or where stud walls are not reinforced (See reinforcement data at right). Maximum depth of screen not to exceed 47″.

WALL SUPPORTED—Screen shall be flush 1¼″ thick made of two sheets of 20 ga. galvanized bonderized steel or (at extra cost) Stainless steel type 18-8 #4 finish (specify which), spaced and insulated with honeycomb cemented under pressure to the inner surfaces. Sides, bottom and top edges shall be bound and interlocked with 18 ga. rolled steel moulding mitered and welded at corners.

Method of attaching screen to the wall shall be with one 8″ length steel (painted to match) bracket #T-133 at the top and one non ferrous chrome bracket T-129 at the bottom. Supporting walls should be reinforced with wood or steel backing by others.

hospital cubicles

MILLS METAL HOSPITAL CUBICLES fill the need in modern Hospital Administration for better control of ward space. They provide greater privacy for ward patients, eliminate drafts, allow nurses or attendants complete visibility of all patients at the same time. In addition, Mills Metal Hospital Cubicles, allow easy access to each patient and permit adequate air circulation. Although rugged and permanent in construction and appearance, Mills Metal Hospital Cubicles can be quickly and easily rearranged, when necessary.

available in three styles:

1. Flush Pilaster 3″ thick.
2. Metal Flush 1¾″ thick
3. Metal Flush 1″ thick.

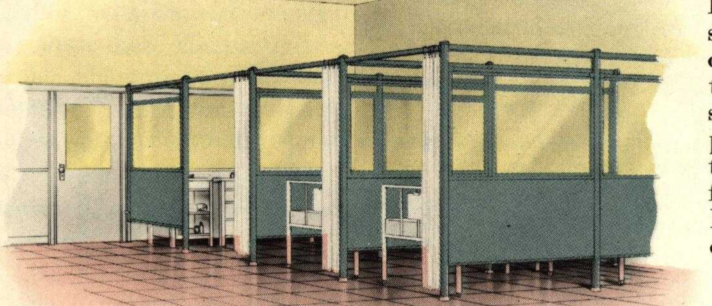
The 3″ thick Flush Pilaster is especially adapted for concealing wiring for call lights, radio plugs, buzzers, etc.
Metal Flush Cubicles may be used where there is no wiring and where economy is a factor.

specifications:

GENERAL—Hospital Cubicles shall be Mills three inch FLUSH PILASTER or 1″ or 1¾″ METAL FLUSH material as manufactured by The Mills Company, 965 Wayside Road, Cleveland 10, Ohio.

FLUSH PILASTER CUBICLES, for complete specifications see Flush Pilaster material in Mills Office Partition Catalog No. 58.

METAL FLUSH SPECIFICATIONS—See Metal Flush Page 16.



GLASS AND GLAZING—

(Omit if not required). Glass glazing for Hospital Cubicles shall be furnished by others, maximum thickness ¼″. Glass shall be bedded in putty and back puttied. Putty shall be furnished by The Mills Co. to match color of cubicle.

junior height

marblmetal

floor braced toilet compartment

MILLS JUNIOR COMPARTMENTS

Similar in construction to Mills Marblmetal Floor Braced, these compartments are in keeping with junior-size lavatories and washroom fittings being furnished by principal plumbing manufacturers. They afford privacy for the kindergarten and lower grade school child but lower height permits supervision by the teacher in charge.

JUNIOR HEIGHT

We suggest maximum overall height of 54″ with panels and doors of 42″ height set 12″ off the floor. . . . For complete specifications see Mills Marblmetal Floor Braced, page 13.

typical layouts for metal shower and bath compartments

The Mills Company's years of leadership in the Toilet Compartment Industry have enabled Mills engineers to develop a series of typical layouts for toilet rooms of different sizes and using various arrangements of the compartments also, typical layouts for shower and tub bath rooms with and without dressing rooms in combination. These layouts have been engineered to make the best use of materials and space without sacrificing appearance. A few of these typical layouts, proven in thousands of installations, are shown at the right. There are many others to fit any size rooms and building conditions.

These and similar recommended layouts are designed to use standard sizes of panels, fronts and doors. Use of standard size units speeds fabricating time and can result in substantial savings.

free engineering service

Mills' staff of experienced engineers is at your service, at any time, to help with your layout problems in Toilet rooms, showers, dressing rooms and hospital cubicles. Consult Mills nearest representative or send us an outline of your needs.

Right is reserved to revise design and specifications and substitute material without notice.

standard sizes of Mills units for toilet compartments

The use of standard units speeds fabrication time and reduces delivery time. It also frequently effects substantial savings in the cost of the completed job. Listed below are the Mills Standard sizes of all units making up Toilet Compartments.

Compartment Widths—30, 32, 34 and 36 in. center to center of dividing panels.

Wall to front of compartment—57 inches.

Other Standard panel depths are 48, 42, 36, 30 and 24 inches. These are used for screens, dressing stalls, urinals and toilet compartments.

Dividing panels and doors—58 in. high.
Floor to bottom of dividing panels—Ceiling hung 12 in., Floor braced, 12 in., Sentinel and Metal Flush 12 in.
Floor to bottom of doors, all types, 12 inches.
Top of doors to top of headrail—12 inches.
Finish floor to top of headrail—82 inches, overall height.
Fronts, standard widths—3, 4, 6, 8, 10, 12 and 14 inches.
Doors, standard widths, 22, 24, 26, 28, 30, 32 and 34 inches.

The foregoing dimensions comply with the modular system of dimensional coordination and are standard stock sizes for Panels, Doors and Fronts.

HOTELS

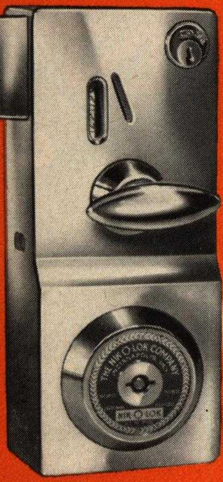
Only Nik-O-Lok offers these exclusive features: durable brass construction with heavy chrome finish—non-pick cash door controlled by a patented key—auditor-approved coin meter that counts traffic for you.

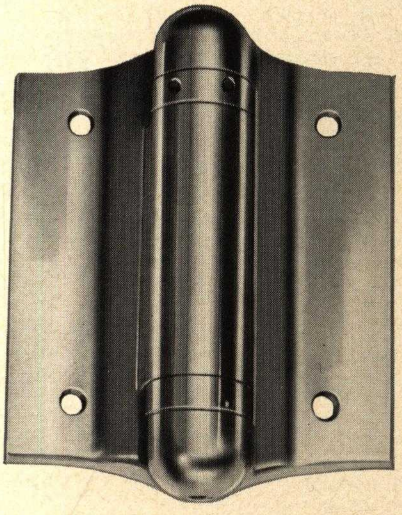
Locks are avilable for individual toilet booths, and for showers and complete dressing rooms . . . in 5c, 10c, 25c and 50c coin denominations.

Write or phone for complete information on the Nik-O-Lok no-investment plan.



- **NO INVESTMENT**—The Nik-O-Lok Company installs, services and maintains NIK-O-LOK equipment without expense or investment to the owner or location operator.
- **A NEW SOURCE OF INCOME**—Coin returns from Nik-O-Lok installations are shared with owner or location operator on an equitable basis.
- **NO SERVICE, REPAIR, OR REPLACEMENT COSTS**—Regular inspections are made by Nik-O-Lok's trained personnel. Over a thousand trained service people, located in branches across the country, are available to quickly solve your maintenance problems.
- **MAXIMUM SANITATION** FOR PATRONS—Nik-O-Lok equipped toilet facilities are guarded against misuse and reduce contamination hazards.
- **PREFERRED FACILITIES**—People prefer pay toilets. A recent survey disclosed that both men and women prefer the privacy and sanitation of a coin-operated, locked toilet.
- **NO BOOKKEEPING PROBLEM** FOR OWNER—Nik-O-Lok's coin meter counts traffic for you. This dependable meter meets with the approval of all auditing departments.
- **PERSONAL CONVENIENCE**—Pass keys are provided for use of authorized personnel.
- **YOU TAKE NO RISK**—Nik-O-Lok provides public liability insurance.
- **DOOR HARDWARE INCLUDED**—No additional hardware to provide. NIK-O-LOK furnishes complete installation of Nik-O-Lok surface spring hinges. See page 3.

MODERN SURFACE SPRING HINGES SUPPLIED WITH ALL NEW LOCK INSTALLATIONS



NIK-O-LOK, for almost half a century the leader in the field of coin-operated toilet locks, now makes available this sensational new aluminum alloy surface spring hinge to meet the need for a better method of suspending lavatory and other similar type doors.

NIK-O-LOK'S exclusive design provides sensational advances in quality of material and performance—as well as in streamlined appearance. Embodying the finest principles of workmanship, the new hinge makes maintenance as easy as A, B, C.

NIK-O-LOK engineering turns a dream into a reality. Years and years of experimenting produced this miracle hinge of lightweight material, yet of the greatest strength and durability.

FASTENING FOR HOLLOW CORE DOORS—Special bushings are provided for this purpose.

1 7/32" STANDARD DRILL
2 7/8" STANDARD DRILL
ALL HOLES 17/64" STANDARD DRILL
CLEARANCE BETWEEN DOOR AND JAMB

HINGE INSTALLATION INFORMATION

Hinges must be installed square and in line with jamb, with winding adjustment always at top.

Standard drilling template furnished if requested.

Standard equipment for mounting one pair hinges:

Eight ¼" x 20 Brass studs (will take up to 2⅛" door or jamb).

Sixteen Chrome plated acorn nuts.

Eight 11/16" washers.

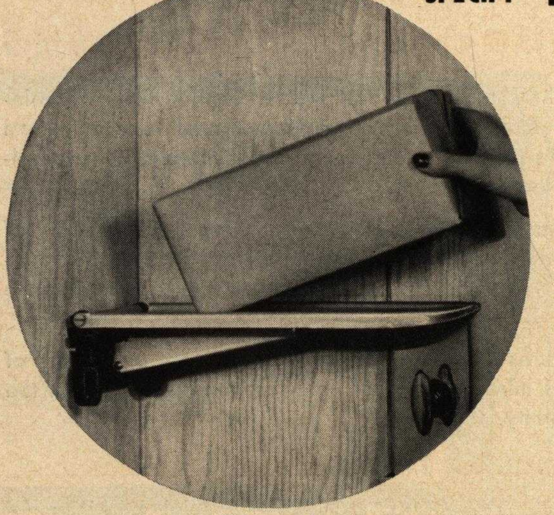
Eight lock washers.

1" x No. 14 round head sheet metal screws may be had when requested.

- Special aluminum alloy permits reduction in weight at no sacrifice in strength or wearing quality.
- Special aluminum alloy retains high luster and makes hinge easy to clean with ordinary cleaning compounds.
- Streamlined design adds that modern appearance, eliminates protruding parts that catch dirt and tear cleaning rags or clothing.
- Has tamper-proof mechanism—sealed in barrel with special socket head pivot screws that can't be removed except with special tools.
- Special oil-tempered spring permits greater resiliency, strength and durability.
- Tension spring operates freely and continuously without impairment because it has diametric ends securely anchored in slotted lugs at top and at bottom.
- Has floating bearings at top and at bottom assuring easy operation. Bearings will withstand maximum wear.
- Winding lug permits adjustment of tension to return door to closed position smoothly and with correct degree of force.

DESIGN GOODWILL INTO REST ROOM INSTALLATIONS

SPECIFY NIK-O-LOK PULLDOWN UTILITY SHELVES



Shows shelf in position for use.

The Nik-O-Lok Pulldown Utility Shelf is an attractive, rugged, folding shelf which is self-clearing. Installed on the side-wall of the booth, it provides a convenient place to lay parcels, purse and gloves, or to hang coats, hats and umbrellas.

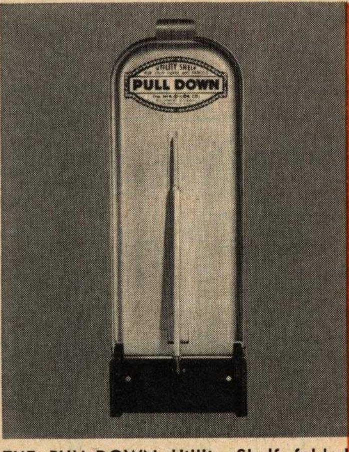
Made of 18 gauge steel, with baked enamel or chrome finish, the Pulldown Utility Shelf has rolled edges, rounded corners and cigarette holder. Although it weighs only about 2½ pounds, it will support over 150 pounds when mounted properly.

Easily installed, the Pulldown Utility Shelf requires no special fasteners. Only 2 holes need be drilled in the side-wall. Mounting studs with chrome plated acorn nuts and washers are provided with each unit.

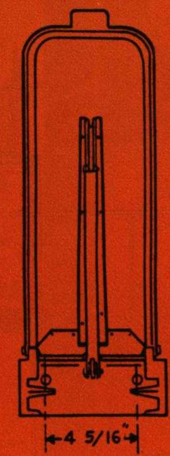
COMPLAINTS REDUCED—Nothing can be stolen from the shelf as it is always in full view of the occupant. Since the shelf must be closed before exit, it compels the removal of all articles and nothing can be forgotten.

DURABLE AND RUGGED—The shelf is designed for hard use but is neat, simple and attractive in design. It fits left or right hand doors. When not in use, a concealed spring holds the shelf in an upright position and out of the way. When open for service, it forms an ample storage tray.

SELF-CLEARING—After each use, the shelf is folded in an upright position to release the door. Therefore, each time the shelf is cleared of all articles.



THE PULL-DOWN Utility Shelf folded in a vacant booth.



SPECIFICATIONS

SHELF TRAY: 18 gauge No. 3 Bright Carbon Steel.

PRIME COAT: Zinc Chromate.

FINISH ENAMEL: No. 165 Gray, baked at 360° for 45 minutes.

CHROME FINISH: Nickel plated over heavy copper base, finished in lustrous chrome plate.

MOUNTING BRACKET: Heavy die-cast aluminum, finished in black wrinkle baked at 360° for 20 minutes.

INSTALLATION: Drill two $\frac{17}{64}$" holes $4\frac{5}{16}$" apart (center to center) at desired height from floor, at a suitable distance from door jamb (6" to 12").

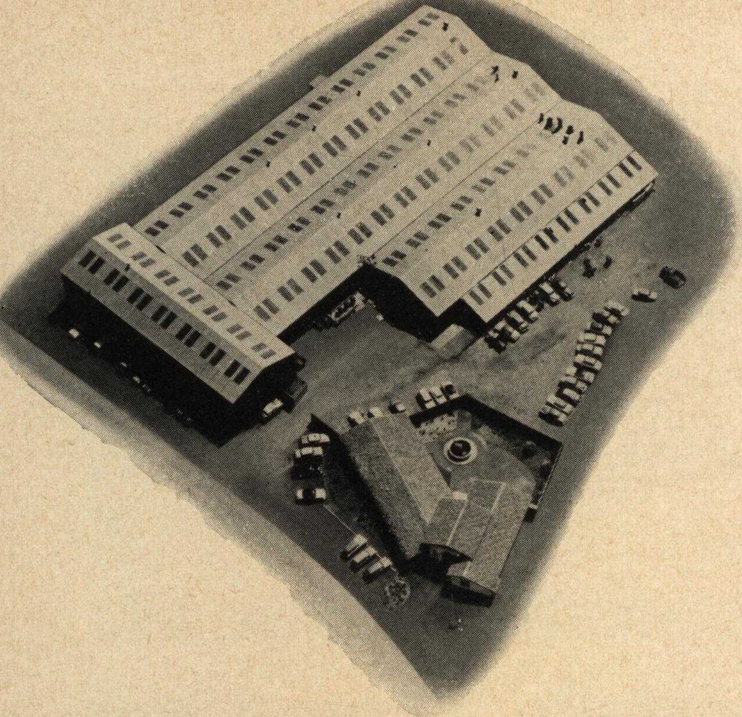
PRICEMETAL CORPORATION • 1777 Industrial Way, Belmont, California

QUALITY, INTEGRITY OVER HALF A CENTURY



Since 1900 the Pricemetal Corporation has been designing and constructing building specialty products. During this period numerous developments have been pioneered within the industry. Testing and research continue—your assurance of even better products.

To provide for fine craftsmanship, progressive engineering research, and mass production efficiency along with the half-century old standard of hand craftsmanship, a new manufacturing plant and warehouse consisting of more than 80,000 square feet of working space was built in Belmont, California. The office facade of early California mission style adobe construction, handcrafted tile roofs, cloister and patio, impress the visitor at first glance with an air of calm serenity. However, behind this facade is a highly modern office, production facility, and complete staff. Semi-autonomous machinery and conveyor systems produce unexcelled uniformity when coupled with rigid physical inspection of each and every part.

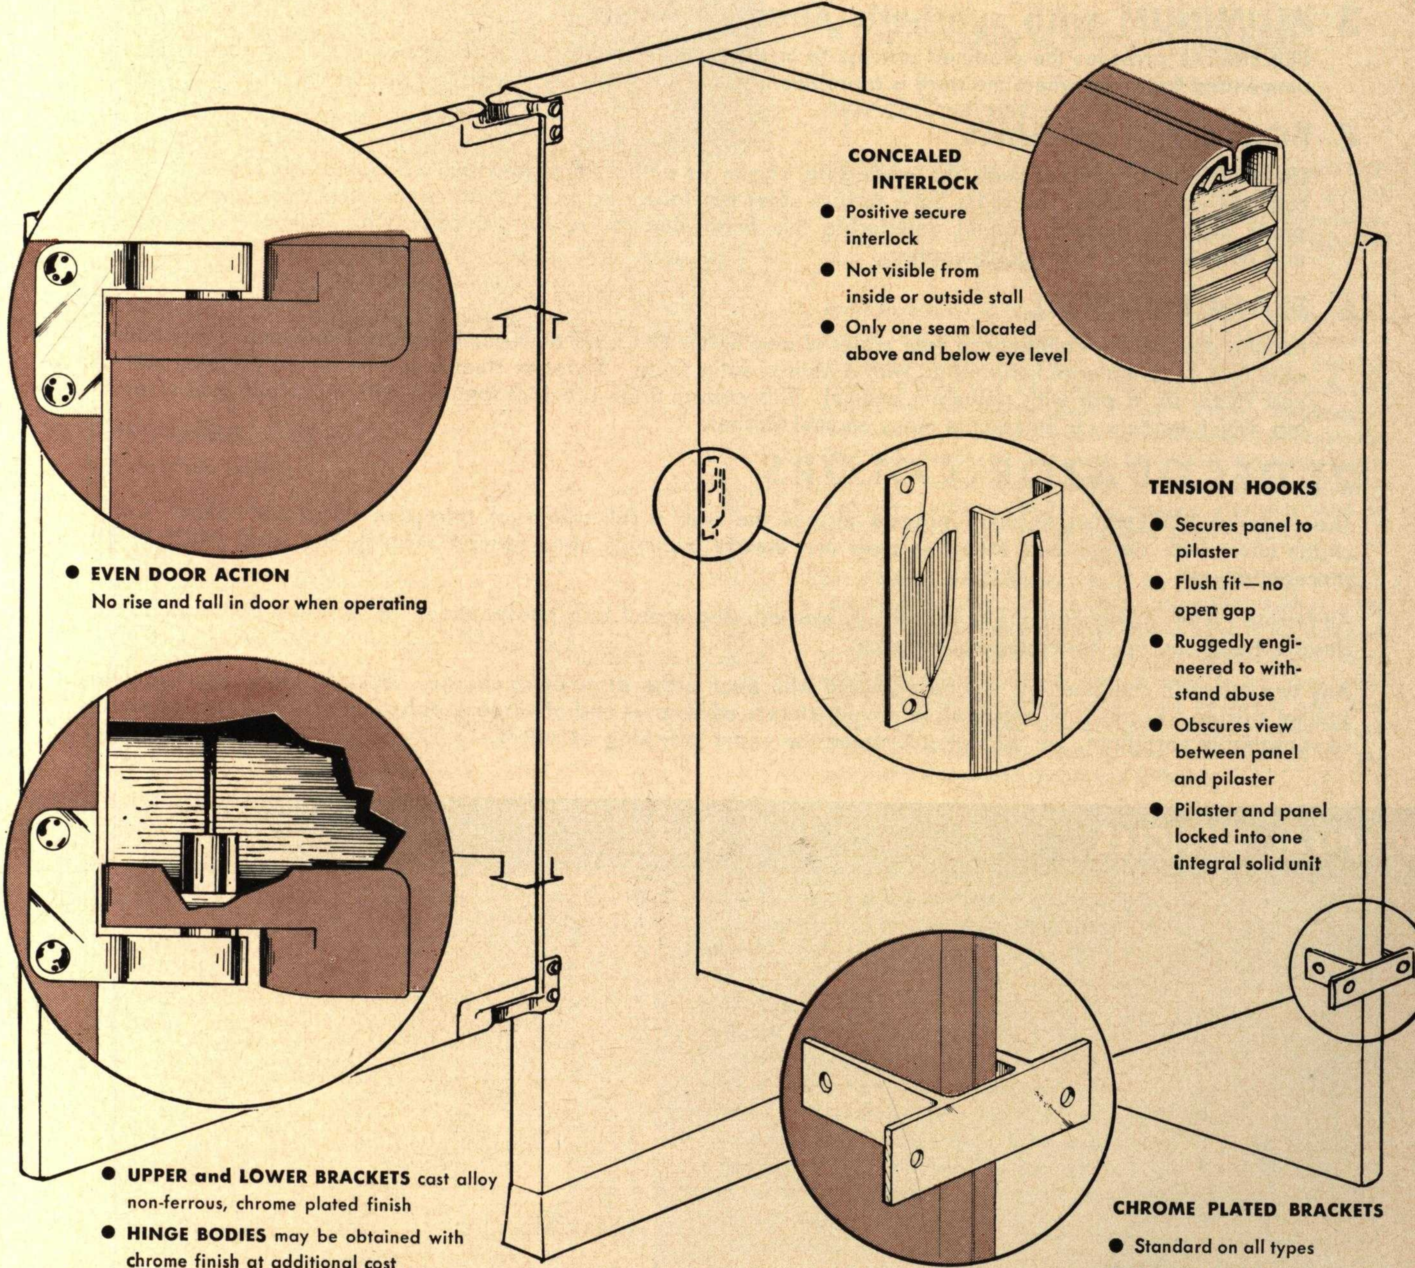
The Pricemetal registered trademark is your guarantee of engineering perfection and integrity.

ARCHITECTURAL SELECTION CHART and INDEX

contents	description	page
● **Features**	Outstanding features, standard on all types.	3
● **Materials and Finishes**	Five outstanding combinations, twenty-one decorator colors.	4
● **Hospital Cubicles**	Standard and custom lines available, satisfies all modern hospital requirements. Designed for ward, corridors and semi-private rooms to meet budget requirements. Readily rearranged.	4
● **Porcelain**	Pricemetal vitreous porcelain enamel coating of inert composition for superior resistance to organic solvents, abrasives and acids.	5
● **Guardian Type pilaster inset** Kindergarten and Lower Grades	Rigid 16 gauge pilasters solidly embedded in deep floor sleeves. Durable construction requires no overhead bracing, discourages gymnastics. Rugged, vandalproof compartments designed for modern elementary school environment. Constructed to withstand years of abuse. Easy supervision, smart low lines, economical design.	6
● **Ceiling Hung Type ceiling supported**	Supported entirely from ceiling and walls, independent of floor, producing fine quality and appearance. Engineered for the ultimate in partition design and sanitation. When used with wall hung bowls, ease of cleaning is guaranteed. Eliminates obstructions.	7
● **Delux Type floor braced**	Streamlined floor and wall supported with no overhead bracing required. Modern, simplified construction readily recommends it for offices, banks, and similar buildings. These attractive low lines harmonize with modern building architecture. Solid floors are required for secure anchorage.	8
● **Flush Pilaster Type overhead braced**	Entirely flush compartments supported by floor, walls and overhead bracing. A popular versatile partition adaptable to all types of installations and environments. Substantial flush construction, economy without apology for the budget minded.	9
● **Shower Stalls and Dressing Compartments**	Variety of layouts, materials and construction. Now available to meet progressive architectural requirements. Consult your Pricemetal representative or write to factory for assistance and suggestions in designing practical, modern layouts.	10
● **Screens**	Complete selection, maximum privacy and sanitation.	10
● **Residential Doors and Frames**	Labor saving, combining wood doors and metal frames.	11
● **Peerless Window Cleaner's Anchors**	Accident Commission approved.	11
● **Hardware and Fittings**	Modern design for appearance and longevity.	12
● **Sales Representatives**		12

PRICEMETAL features — PRECISION ENGINEERING—SYMMETRICAL DESIGN

- Smooth floating, silent action with finger tip control
- Simple installation with no maintenance
- No hinge projection above or below door line
- One moving part eliminates wear
- Concealed operating components mechanically perfect
- Simplicity in design provides strength, life-long service
- Simple, accurate, adjusting control locates door in any position



CONCEALED INTERLOCK

- Positive secure interlock
- Not visible from inside or outside stall
- Only one seam located above and below eye level

TENSION HOOKS

- Secures panel to pilaster
- Flush fit—no open gap
- Ruggedly engineered to withstand abuse
- Obscures view between panel and pilaster
- Pilaster and panel locked into one integral solid unit

- **EVEN DOOR ACTION**
  No rise and fall in door when operating

- **UPPER and LOWER BRACKETS** cast alloy non-ferrous, chrome plated finish
- **HINGE BODIES** may be obtained with chrome finish at additional cost

CHROME PLATED BRACKETS

- Standard on all types
- Rustproof non-ferrous
- Smart appearance
- Harmonizes with door hardware

TEST DATA:

DOOR OPENED AND CLOSED 500,000 TIMES WITH NO HINGE WEAR

5 COMBINATIONS (materials and finishes)

1 BONDERIZED, ZINC COATED STEEL with synthetic enamel finish

This galvanized superior corrosion resistant finish with an additional bonderized phosphatized coat and rust resisting primer adds dramatically to the service life. We strongly recommend it for all types of installation.

2 COLD ROLLED FURNITURE STEEL with synthetic enamel finish

Where economy is a factor PRICEMETAL Furniture Steel with our exclusive automatic conveyorized phosphatizing treatment coupled with the rust resisting primer and enameling process provides an excellent finish. This is not recommended for shower room areas or unusual conditions.

3 ALUMINUM with synthetic enamel finish

PRICEMETAL provides the alodined process to insure positive and lasting paint adherence. This material is recommended for areas where moisture is a problem. Aluminum is the ideal product for showers and shower areas.

4 PORCELAIN ENAMEL

The PRICEMETAL process seals the enameling iron in its entirety followed by outside porcelain enamel color coats of your choice. The glass hard surface does not fade, resists uric acid, alkali, and odor retention. Organic cleaning solvents cannot deteriorate this finish due to its inert composition. Deliberate vandalism and defacement is virtually eliminated.

5 STAINLESS STEEL

For the ultimate in maintenance free material and finish, PRICEMETAL recommends stainless steel. This is durable and 18-8 material is furnished with a natural satin finish. Stainless steel is a time tested material with a cost factor on a par with porcelain enamel. This natural finish provides long life with no chipping or scratching, which tendency is inherent in many enamel finishes.

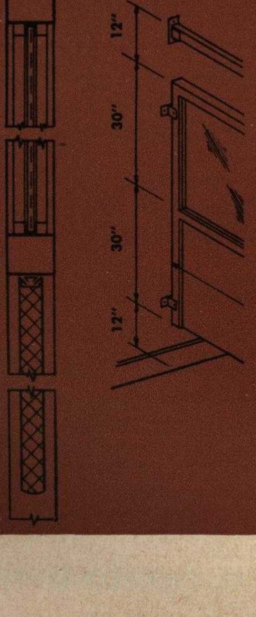
21 DECORATOR COLORS

The exclusive PRICEMETAL finishing process insures the user a full range of attractive decorator colors. Color charts along with design and layout services are always available upon request through our local PRICEMETAL representatives.

All ferrous metal components are automatically washed, degreased and phosphatized for positive paint adhesion, durable finish and eye appealing appearance.

Any two colors in combinations will be provided with each order at no extra charge—three or more colors require special pricing. Because all responsible manufacturers of enamel and of vitreous porcelain frit retain the privilege of reasonable variations, we cannot guarantee the exact matching of colors.

HOSPITAL CUBICLES

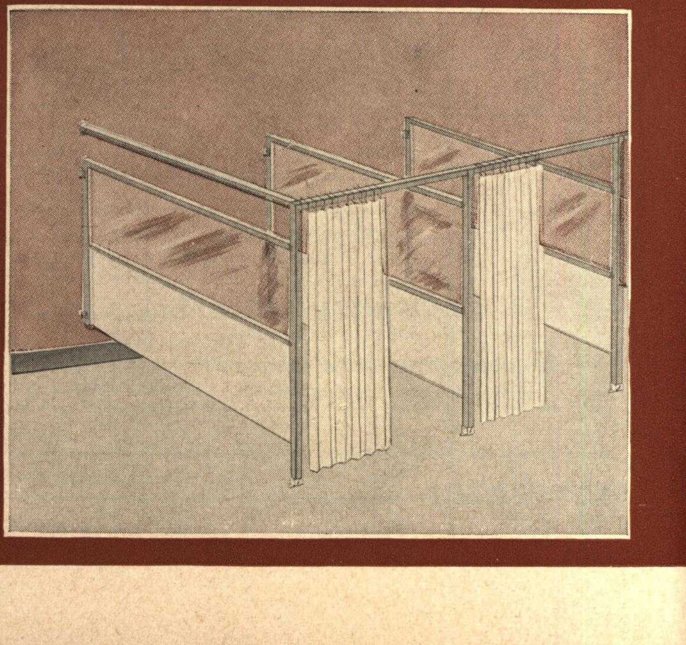


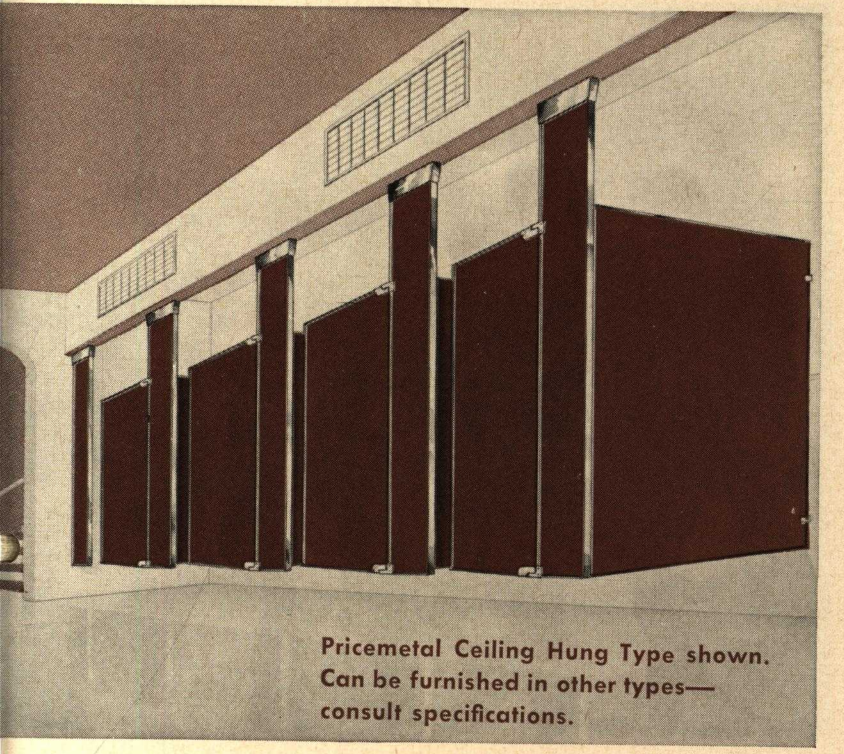
Dramatic savings in per bed costs of hospitals and institutions can be effected through the proper use of PRICEMETAL hospital cubicles.

PRICEMETAL hospital cubicles for adults, children and infants are created with simplicity of design yet provide adequate privacy and harmony with modern interior treatments. With our well planned glass observation areas, more bed space per nurse, complete patient supervision is accomplished.

PRICEMETAL partitions can be moved and relocated by hospital personnel for rapid ward rearrangement when necessary.

All cubicles are furnished completed (except for glass) including curtains and rings, adequate provision for wiring, oxygen pipe outlets and special requirements when requested. Architectural consultation is invited by our engineering staff.





Pricemetal Ceiling Hung Type shown. Can be furnished in other types—consult specifications.

VITREOUS PORCELAIN ENAMEL

features

- freedom from rust
- shock proof
- abrasive resistance
- perpetual attractiveness
- impregnable to uric acid and odor

specifications

general—Furnish and install all metal partitions of PRICEMETAL vitreous porcelain enamel (Ceiling Hung, Delux or Flush Pilaster style, and shower or dressing rooms), material as manufactured by the PRICEMETAL Corporation, 1777 Industrial Way, Belmont, California.

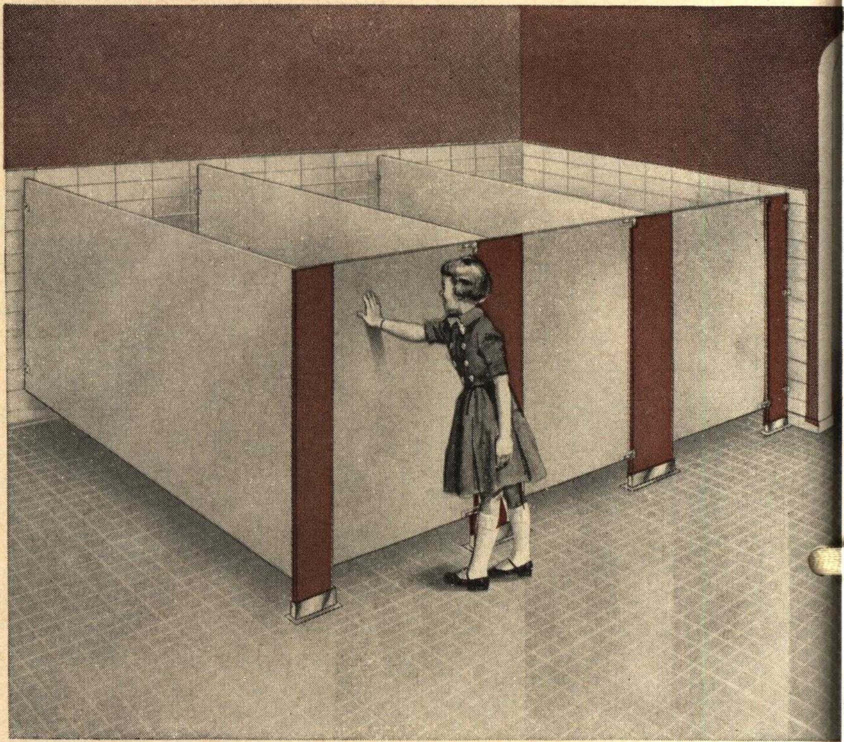
construction—Ceiling Hung, Delux or Flush Pilaster, doors, panels and pilasters shall be made of PRICEMETAL porcelain enameling iron completely sealed with vitreous porcelain enamel ground coat and color coat of PRICEMETAL colors, in accordance with the Porcelain Enamel Institute's standards for architectural porcelain enamel, assembled over a honeycomb filler, glued with a waterproof adhesive under pressure with closure strips for edge bindings of stainless steel compatible with the hardware finish. The applied moulding shall be welded, ground smooth and polished at the corners.

partitions and doors—Shall be approximately 1" thick, composed of two sheets of carefully selected PRICEMETAL enameling iron for minimum warpage during firing in the automatic continuous firing furnaces, spaced and insulated with sound deadening filler, cemented under pressure to the inner edges with waterproof adhesive. Edges shall be bound and interlocked with die-drawn stainless steel moulding under tension to the preformed panel faces mitered and welded at the corners with welds ground smooth and polished.

pilasters—Shall be approximately 1 9/16" thick, composed of two sheets of carefully selected PRICEMETAL enameling iron for minimum warpage during firing in the automatic continuous firing furnaces, spaced and insulated with sound deadening filler, cemented under pressure to the inner edges with waterproof adhesive. Pilaster reinforcing shall be of PRICEMETAL extra heavy duty contour. Edges shall be bound and interlocked with die-drawn stainless steel moulding under tension to the preformed panel faces mitered and welded at the corners with welds ground smooth and polished. Pilaster base shoes 3" high polished stainless steel. Other fittings alloy chrome plated.

hardware—Standard hardware sets consist of the PRICEMETAL CONCEALED TORSIONAMIC HINGE ASSEMBLY, the hinge house casting to conceal all mechanisms and cover the raw edge of the moulding strip with screw attachment to permit removal, combination latch and bumper, keeper, combination coat hook and bumper. All hardware and exposed fittings shall be rust proof alloy, highly polished chrome plated. Die drawn mouldings shall be of stainless steel polished finish to match hardware. Wall brackets shall be non-ferrous metal, polished chrome. Base shoes to be highly polished stainless steel 3" high.

GUARDIAN TYPE (pilaster inset)
Kindergarten and Lower Grades



features

- low, modern, rugged
- durable pilaster support
- no overhead bracing
- easy supervision
- rigid, lifetime floor anchoring

specifications

general—Furnish and install PRICEMETAL "Guardian" type partitions as manufactured by PRICEMETAL Corporation, 1777 Industrial Way, Belmont, California.

construction—Flush DOORS, PARTITIONS and PILASTERS shall be assembled over a honeycomb filler and glued with a waterproof adhesive under pressure. The steel sheets shall be formed in such a way that they will interlock with one another without the use of applied mouldings resulting in only one seam. Pilaster seam to be located on the edge of the inside face and not visible from the outside. Panel and Door seam to be located on middle of edge radius* and not visible from inside or outside of stall. All corners shall be welded and ground smooth.

pilasters—Shall be 1⁹⁄₁₆" thick made of two sheets of 16 gauge bonderized, zinc-coated steel. Pilasters shall be set in floor sleeves with PorRok and mastic. Top of pilasters to be on the same plane as top of doors.

partitions and doors—Shall be 1" thick made of two sheets of bonderized, zinc-coated steel. (Partitions 20 gauge—Doors 22 gauge). Partitions shall be secured to pilasters with no less than three (3) concealed tension hooks. ***No visible clearance between pilaster and panel will be acceptable.*** See page 3.

base shoes and sleeves—Stainless steel base shoe shall be 3" high placed over stainless steel floor cover plate. Floor sleeves shall be 2½" wide, 14 gauge steel hot dip galvanized after fabrication. Sleeves may be obtained in stainless steel at additional cost. Floor sleeves to be supplied by PRICEMETAL and set by general contractor.

hardware and fittings—The standard hardware shall be used, consisting of PRICEMETAL CONCEALED TORSIONAMIC HINGE ASSEMBLY**, ***(no part of the hinge assembly shall extend either above or below the door line)***, combination latch and bumper, keeper, combination coat hook and bumper. All hardware and exposed fittings shall be rust proof alloy, high polish chrome plated, applied with PRICEMETAL fastenings throughout. ***Wall brackets shall be non-ferrous metal, chrome plated.*** Base shoes to be high polish, stainless steel 3" high. Hinge housing to match door finish.

finish—All material is cleaned, bonderized and given one coat of baked on primer followed by one or two coats (as specified) baked on enamel. (Each coat baked on separately at a temperature of 350°.) Colors as selected from manufacturer's twenty-one standards.

special material and finishes—Please specify if desired. ALUMINUM—with baked enamel finish. Same gauges and assembled with binding strips and filled with honeycomb filler glued with a waterproof adhesive under pressure.

STAINLESS STEEL—18-8 with natural finish. Same gauges and construction as outlined above.

*Exclusive concealed interlock (patent applied for).

**See page 3 for TORSIONAMIC HINGE ASSEMBLY.

specifications

general—Furnish and install PRICEMETAL "Ceiling Hung" type partitions as manufactured by PRICEMETAL Corporation, 1777 Industrial Way, Belmont, California.

construction—Flush DOORS, PARTITIONS and PILASTERS shall be assembled over a honeycomb filler and glued with a waterproof adhesive under pressure. The steel sheets shall be formed in such a way that they will interlock with one another without the use of applied mouldings resulting in only one seam. Pilaster seam to be located on the edge of the inside face and not visible from the outside. Panel and Door seam to be located on middle of edge radius* and not visible from inside or outside of stall. ***(Where panel abuts edge of pilaster, single stall in recess, use Flush Pilaster type construction.)*** All corners shall be welded and ground smooth.

partitions and doors—Shall be 1" thick made of two sheets of bonderized zinc-coated steel. (Partitions 20 gauge—Doors 22 gauge). Partitions shall be secured to pilasters with ne less than three (3) concealed tension hooks. ***No visible clearance between pilaster and panel will be acceptable.*** See page 3.

pilaster—Shall be 1⁹⁄₁₆" thick made of two sheets of 16 gauge bonderized zinc-coated steel. They shall be supported entirely from the ceiling with concealed "built in" bar leveling device welded intregal to pilaster and secured with ⅜" bolts and nuts anchored to beam. The supporting member to be built into the ceiling shall be supplied and installed by others. This member must be rigid both vertically and horizontally.

hardware and fittings—The standard hardware shall be used, consisting of PRICEMETAL CONCEALED TORSIONAMIC HINGE ASSEMBLY**, ***(no part of the hinge assembly shall extend either above or below the door line)***, combination latch and bumper, keeper, combination coat hook and bumper. All hardware and exposed fittings shall be rust proof alloy, high polish chrome plated, applied with PRICEMETAL fastenings throughout. ***Wall brackets shall be non-ferrous metal, chrome plated.*** Base shoes to be high polish, stainless steel 3" high.

finish—All material is cleaned, bonderized and given one coat of baked on prime followed by one or two coats (as specified) baked on enamel. (Each coat baked on separately at a temperature of 350°.) Colors as selected from manufacturer's twenty-one standards.

special material and finishes—Specify if desired.

COLD ROLLED FURNITURE STEEL—with baked enamel finish. Same gauges and construction.

ALUMINUM—with baked enamel finish. Same gauges and assembled with binding strips and filled with honeycomb filler glued with a waterproof adhesive under pressure.

STAINLESS STEEL—18-8 with natural satin finish. Same gauges and construction as outlined above.

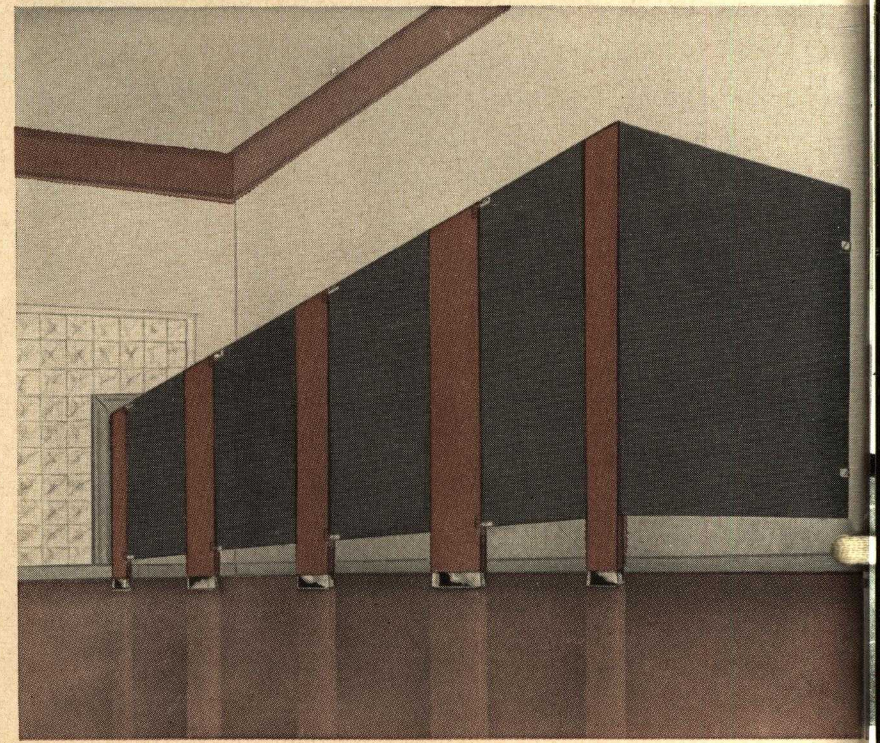
PORCELAIN ENAMEL FINISH—See page 5.

*Exclusive concealed interlock (patent applied for).
**See page 3 for TORSIONAMIC HINGE ASSEMBLY.

DELUX TYPE (floor braced)

features

- **streamlined styling**
- **complements modern architecture**
- **no headrail**
- **solid floor slabs required**



specifications

general—Furnish and install PRICEMETAL "Delux" type partitions as manufactured by PRICEMETAL Corporation, 1777 Industrial Way, Belmont, California.

construction—Flush DOORS, PARTITIONS and PILASTERS shall be assembled over a honeycomb filler and glued with a waterproof adhesive under pressure. The steel sheets shall be formed in such a way that they will interlock with one another without the use of applied mouldings resulting in only one seam. Pilaster seam to be located on the edge of the inside face and not visible from the outside. Panel and Door seam to be located on middle of edge radius* and not visible from inside or outside of stall. ***(Where panel abuts edge of pilaster, single stall in recess, use Flush Pilaster type construction.)*** All corners shall be welded and ground smooth.

partitions and doors—Shall be 1" thick made of two sheets of bonderized zinc-coated steel. (Partitions 20 gauge—Doors 22 gauge). Partitions shall be secured to pilasters with no less than three (3) concealed tension hooks. ***No visible clearance between pilaster and panel will be acceptable.*** See page 3.

pilasters—Shall be 1⁹⁄₁₆" thick made of two sheets of 16 gauge bonderized zinc-coated steel. Pilasters shall extend from floor to the top of the doors. A concealed "built in" bar anchoring and leveling device shall be welded integral to pilaster and fastened to floor with ⅜" stud bolts anchored in expansion shields below finish floor (not recommended for wood floors—suggest use of Flush Pilaster type).

hardware and fittings—The standard hardware shall be used, consisting of PRICEMETAL CONCEALED TORSIONAMIC HINGE ASSEMBLY**, ***(no part of the hinge assembly shall extend either above or below the door line)***, combination latch and bumper, keeper, combination coat hook and bumper. All hardware and exposed fittings shall be rust proof alloy, high polish chrome plated, applied with PRICEMETAL fastenings throughout. ***Wall brackets shall be non-ferrous metal, chrome plated.*** Base shoes to be high polish, stainless steel 3" high.

finish—All material is cleaned, bonderized and given one coat of baked on prime followed by one or two coats (as specified) baked on enamel. (Each coat baked on separately at a temperature of 350°.) Colors as selected from manufacturer's twenty-one standards.

Partitions shall be secured to pilasters with no less than three (3) concealed tension hooks. ***No visible clearance between pilaster and panel will be acceptable.*** See page 3.

pilasters—Shall be $1\frac{9}{16}''$ thick made of two sheets of 20 gauge bonderized zinc-coated steel. Pilasters shall extend from the floor to 12" above the door height.

bracing—Bracing shall be done with a 1" x $1\frac{1}{2}''$ 16 gauge tubing, continuous through the top of the pilasters, which are notched to receive this headrail. This construction precludes the use of overlapping cover caps.

hardware and fittings—The standard hardware shall be used, consisting of PRICEMETAL CONCEALED TORSIONAMIC HINGE ASSEMBLY**, ***(no part of the hinge assembly shall extend either above or below the door line)***, combination latch and bumper, keeper, combination coat hook and bumper. All hardware and exposed fittings shall be rust proof alloy, high polish chrome plated, applied with PRICEMETAL fastenings throughout. ***Wall brackets shall be non-ferrous metal, chrome plated.*** Base shoes to be high polish, stainless steel 3" high. Hinge housing to match door finish.

finish—All material is cleaned, bonderized and given one coat of baked on primer followed by one or two coats (as specified) baked on enamel. (Each coat baked on separately at a temperature of 350°.) Colors as selected from manufacturer's twenty-one standards.

special material and finishes—Specify if desired.

COLD ROLLED FURNITURE STEEL—with baked enamel finish. Same gauges and construction.

ALUMINUM—with baked enamel finish. Same gauges and assembled with binding strips and filled with honeycomb filler glued with a waterproof adhesive under pressure.

STAINLESS STEEL—18-8 with natural satin finish. Same gauges and construction as outlined above.

PORCELAIN ENAMEL FINISH—See page 5.

*Exclusive concealed interlock (patent applied for).
**See page 3 for TORSIONAMIC HINGE ASSEMBLY.

SCALE: 3" = 1'0"

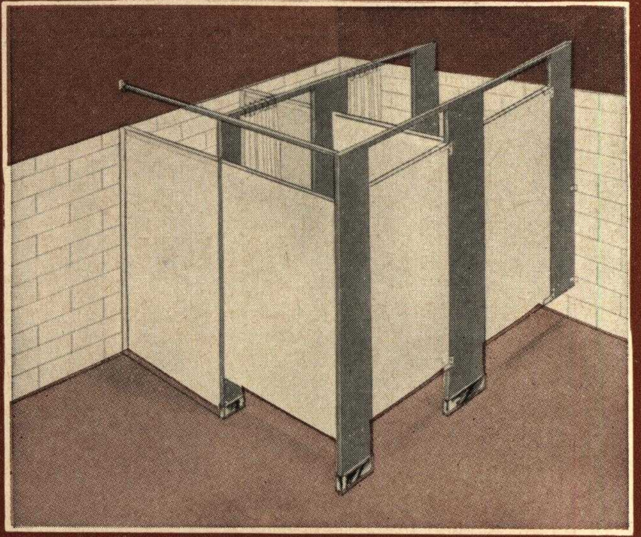
SHOWER STALLS and DRESSING COMPARTMENTS

PRICEMETAL Flush Pilaster type Dressing Compartments combined with Style-Line battery shower stalls are designed to accomplish economical, sturdy, and sanitary installations. This smart, functional construction provides the answer to all types of conditions, since it may be fabricated to meet every locker room requirement.

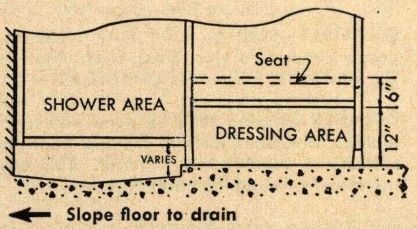
Dressing Compartments (Flush Pilaster type) may be provided in conjunction with Style-Line shower stalls or independently. These neat enclosures may be furnished with flush metal doors or curtains with roller rings. (Roller rings are provided to roll on standard headrail, thus eliminating special curtain rod.) Seats, either wood or metal, will be supplied to fit the various conditions.

Shower Stalls (Style-Line type) panels with "V" rail at top and bottom constructed from 16 gauge bonderized, zinc-coated steel, aluminum or stainless steel may also be obtained independent of Flush Pilaster type dressing compartments if so desired. These economical enclosures will be provided with plumbing space or prepared for necessary fixtures depending upon locker room layout. Stalls may be installed on curb or depressed slab as detailed.

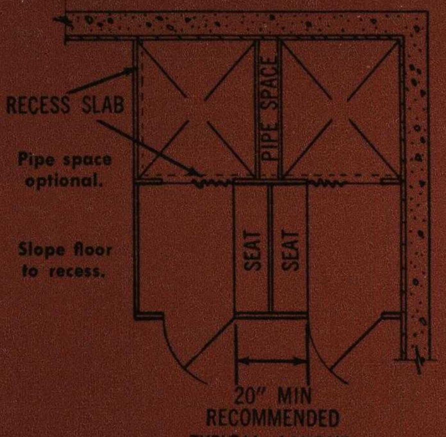
PRICEMETAL recommends that dressing room enclosures be fabricated in accordance with the specification on page 9 for Flush Pilaster type. Shower compartments should be specified with Style-Line dividing panels one sheet 16 gauge material. Materials should be bonderized, zinc coated steel, aluminum or stainless steel with natural finish. Finish for bonderized-galvanized or aluminum to be one coat of baked-on prime followed by two coats of synthetic baked enamel. (Each coat baked on separately at a temperature of 350°.) Colors as selected from manufacturer's twenty-one standards.



Lower Portion
Side Elevation



This basic design can be adapted to varied layouts. Ask your Pricemetal Representative.



TYPICAL LAYOUT

URINAL SCREENS

4 distinctive types to choose from . . .

- Type "A" (wall hung type) Off the floor—saves cleaning time.
- Type "B" (post surrounded) Attached to floor and wall—rugged.
- Type "C" (floor support) Attached to floor and wall—modern.
- Type "D" (post to ceiling) Attached to floor, wall and ceiling.

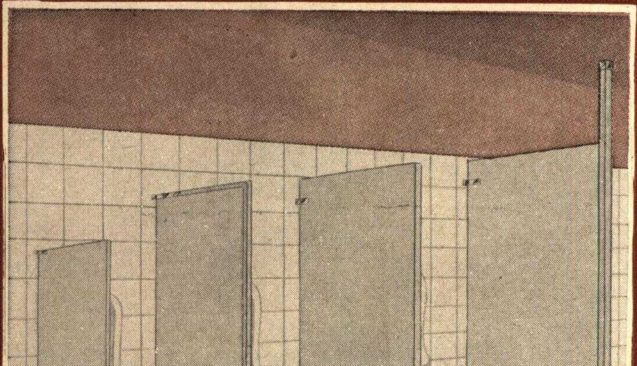
4 dependable materials and finishes available . . .

- Zinc coated, bonderized steel with primer and baked enamel finish.
- Aluminum with primer and baked enamel finish.
- Enameling steel with porcelain enamel finish.
- Stainless steel with natural satin finish.

sizes available

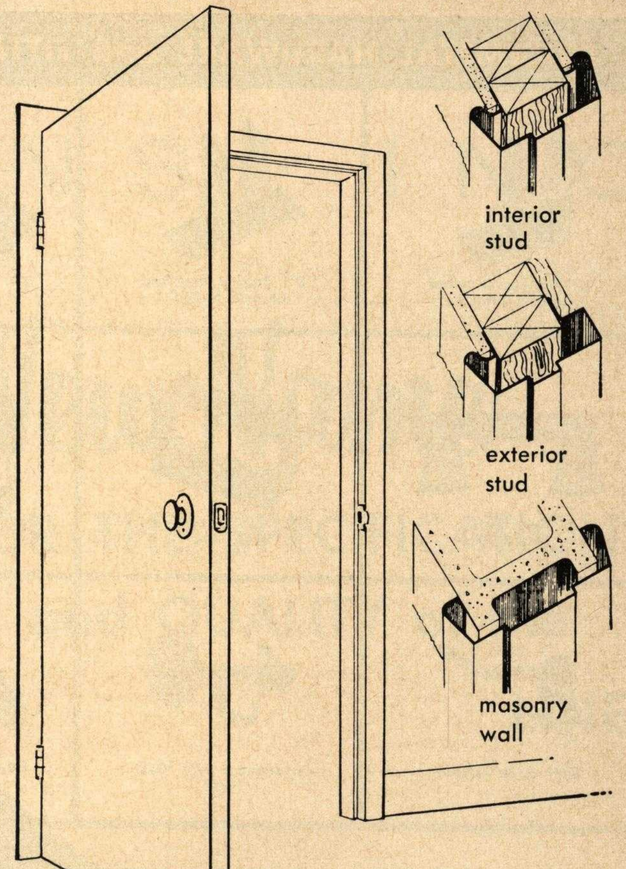
Type	Width	Panel Height	Off the Floor
A	18", 24"	42"	12", 18"
B	24", 30"	58"	12"
C	30", 36"	70"	0"
D	30", 36", 42", 48", 54", 57"	58"	12"

Note: Secure backing (by others) required for all types.



Wall Hung Type "A"   Post Surround Type "B"   Floor Support Type "C"   Post to Ceiling Type "D"

PRICEMETAL residential doors and frames



- saves labor—installed in 7 minutes
- modern streamlined casing
- no special backing or tools required
- recessed for sheetrock—eliminates taping

specifications

frames—18 gauge cold rolled steel with mitered corners and integral interlocking tabs for easy field assembly.

finish—Clean and phosphate coat to be followed by one coat light colored primer. Frames shipped knocked down with size indicated.

butts—Round cornered, steel brass plated, one pair 3½" x 3½" screwed to frame.

strike plate—Adjustable. Steel brass plated, with plain steel dust box.

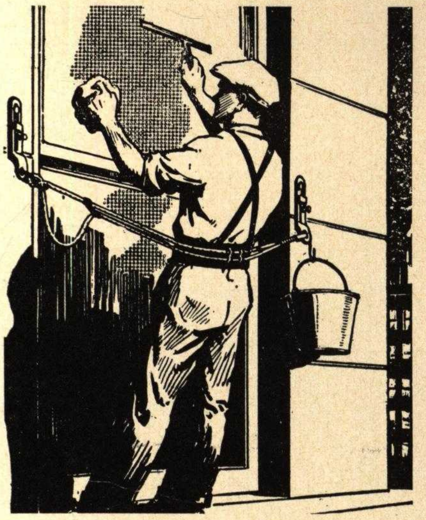
fastening—Frames punched for nail holes in jamb and head.

doors—Flush hollow core doors in Philippine mahogany, birch and other woods.

cores—Interlocked wood strips, precision cut and assembled to form 3½" modular center ventilated grid. Mortised for hardware.

stiles and rails—2½" wide kiln dried pine or Douglas fir, with suitable lock blocks.

"PEERLESS" WINDOW CLEANER'S SAFETY ANCHORS



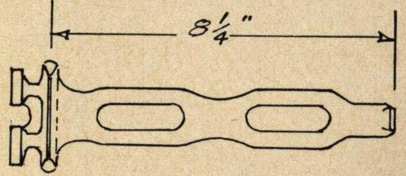
description

The safety rules in many states require the use of anchors at jambs and mullions of certain windows over 12 feet from grade. Peerless anchors are approved for use in many states, including California. They are forged from virgin Duronze III, an aluminum silicon alloy, which has a tensile strength of over 80,000 psi. Peerless anchors are made to satisfy any condition.

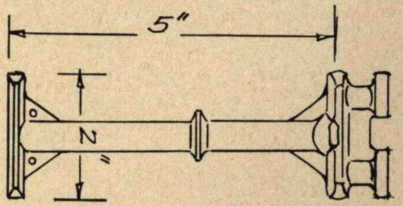
specifications

Window cleaner's safety anchors shall be "Peerless" as manufactured by PRICEMETAL Corporation, 1777 Industrial Way, Belmont, California. Anchors must meet all state regulations of safety, and cast anchors will not be allowed. See plans for types.

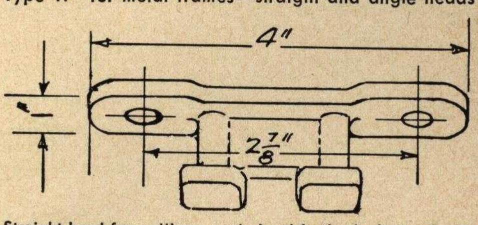
Type A—for brick walls



Type D—for new concrete



Type H—for metal frames—straight and angle heads



Straight head for mullions, angle head for jamb, fastened with two ⅜" 16 slotted R.H. Stainless Steel or Monel M.S. length of screws to suit conditions.

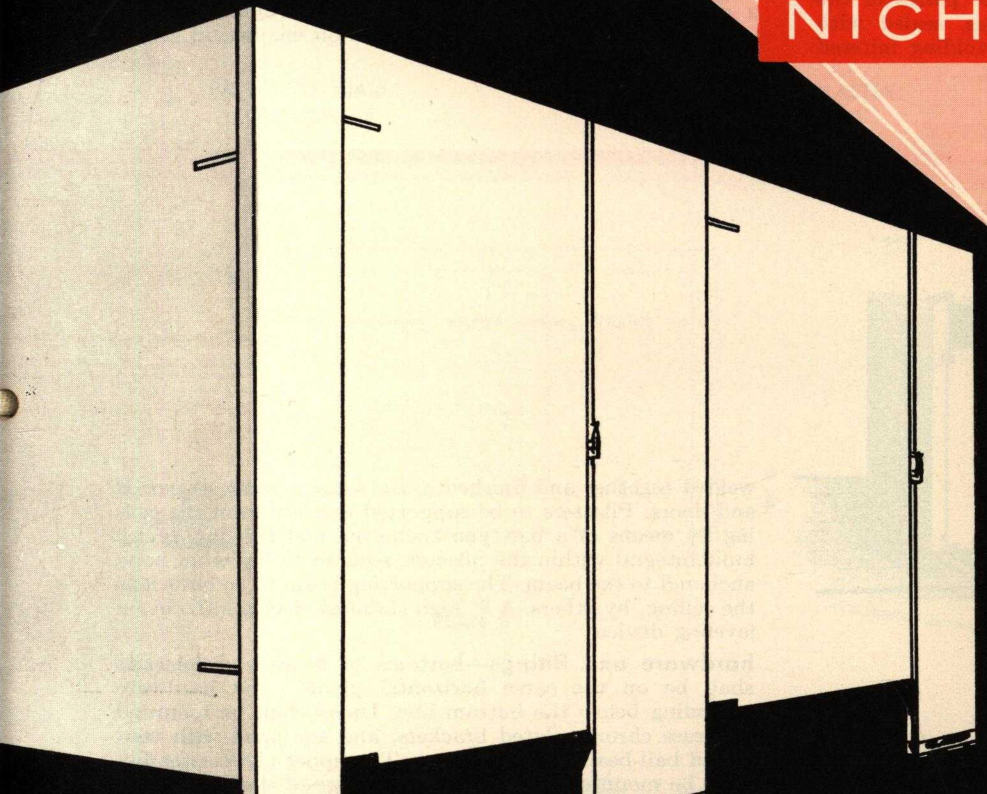
PARTITIONS · INC.

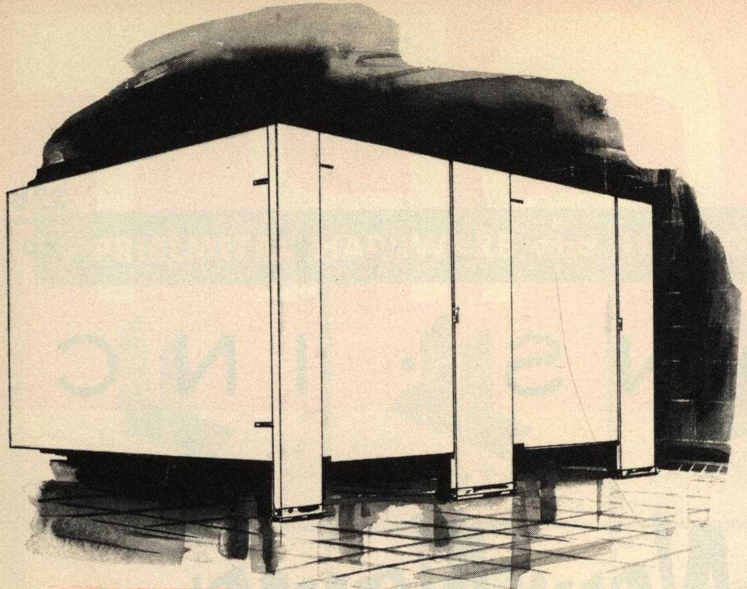
A New Name

FOR THE SPECIFICATIONS and QUALITY of the NICHOLSON LINE!



QUALITY · SERVICE · DELIVERY

Ruddle Street, Wilkes-Barre, Pa.



TYPE A FLOOR BRACED

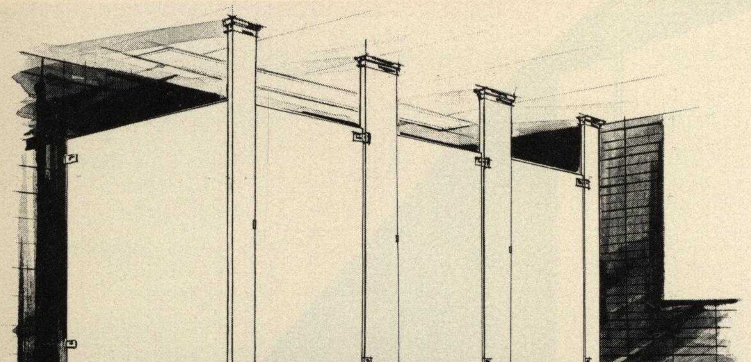
SPECIFICATIONS—general—All toilet compartments shall be Type "A" as manufactured by Robart Partitions, Inc.*

dividing panels and doors—panels and doors shall be 1″ thick, fabricated of two sheets of 20-gauge stretcher-leveled furniture steel,** assembled over and cemented under pressure to a honeycomb core insulation. Face plates of the panels and doors shall have formed edges, sealed with continuous oval crown locking molding. Molding mitered and welded at corners, then ground smooth.

pilasters—pilasters shall be independently mounted. 70″ in height, 1¼″ in thickness, fabricated of two sheets of 16-gauge steel welded together and finished in the same manner as panels and doors. Pilasters to be securely anchored to floor by means of a bar-type anchoring and leveling device built integral within the pilaster, secured by ⅜″ stud bolts anchored in expansion shields below the finished floor. A 3″ high stainless-steel floor plinth covers leveling device.

hardware and fittings—top of doors and pilasters shall be on the same horizontal plane. Doors shall be mounted on brass chrome-plated brackets, and equipped with concealed ball-bearing roller hinges. The upper pivot assembly shall be mounted in a recess in the edge of the door. Door shall be fitted with a combination keeper and bumper, slide latch and coat hook with rubber-tipped bumper. (Door pulls and two-prong coat hooks supplied with outswing doors.) Wall and panel brackets shall be manufactured of 12-gauge steel, enamelled to match partitions. Chrome-plated brackets optional.*** Latches, coat hooks and panel brackets supplied with chrome-plated theft-proof screws.

finish—all metal parts shall be thoroughly cleaned, leaving a phosphate deposit primed with zinc chromate primer, and finished with two coats of baked-on enamel, in colors of user's choice, baked at 420°F.



TYPE AC CEILING HUNG

SPECIFICATIONS—general—All toilet compartments shall be Type "AC" as manufactured by Robart Partitions, Inc.*

dividing panels and doors—panels and doors shall be 1″ thick, fabricated of two sheets of 20-gauge stretcher leveled furniture steel,** assembled over and cemented under pressure to a honeycomb core insulation. Face plates of the panels and doors shall have formed edges, sealed with continuous oval crown locking molding. Molding mitered and welded at corners, then ground smooth.

pilasters—pilasters shall be independently suspended. 1¼″ in thickness, fabricated of two sheets of 16-gauge steel welded together and finished in the same manner as panels and doors. Pilasters to be supported entirely from the ceiling by means of a bar-type anchoring and leveling device built integral within the pilaster, secured by ⅜″ stud bolts anchored to the beam. The supporting beam to be built into the ceiling, by others. A 3″ high stainless steel plinth covers leveling device.

hardware and fittings—bottoms of doors and pilasters shall be on the same horizontal plane . . . no hardware extending below the bottom line. Doors shall be mounted on brass chrome-plated brackets, and equipped with concealed ball-bearing roller hinges. The upper pivot assembly shall be mounted in a recess in the edge of the door. Door shall be fitted with a combination keeper and bumper, slide latch and coat hook with rubber-tipped bumper. (Door pulls and two-pronged coat hooks supplied with outswing doors.) Wall and panel brackets shall be manufactured of 12-gauge steel, enamelled to match partitions. Chrome-plated brackets optional.*** Latches, coat hooks and panel brackets supplied with chrome-plated theft-proof screws.

finish—all metal parts shall be thoroughly cleaned, leaving a phosphate deposit, primed with zinc chromate primer, and finished with two coats of baked-on enamel, in colors of user's choice, baked at 420°F.

*As previously manufactured by W. H. Nicholson and Co.

**Galvanized bonderized steel, when specified.

***Available at slight additional cost.

TYPE AR
OVERHEAD BRACED

SPECIFICATIONS—general All toilet compartments shall be Type "AR" as manufactured by Robart Partitions, Inc.*

dividing panels and doors—panels and doors shall be 1″ thick, fabricated of two sheets of 20-gauge stretcher-leveled furniture steel,** assembled over and cemented under pressure to a honeycomb core insulation. Face plates of the panels and doors shall have formed edges sealed with continuous oval crown locking molding. Molding mitered and welded at corners, then ground smooth.

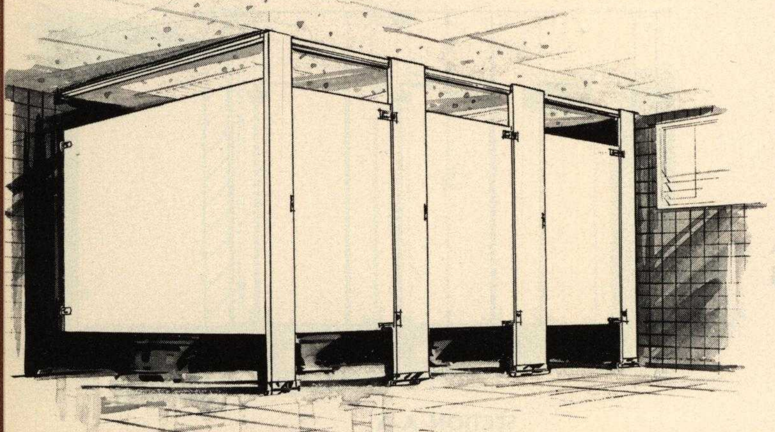
pilasters—pilasters shall be 1¼″ thick, 82″ high, fabricated of two sheets of 20-gauge steel welded together and finished in the same manner as panels and doors. Pilasters to be internally reinforced with 16-gauge plates to receive stirrups for dividing panels. Pilasters to be securely anchored to the floor by fittings, providing for vertical adjustment for uneven floors.

headrail—pilasters to be securely braced with 1″ x 1½″ 16-gauge steel seamless rectangular tubing, continuous through the top of the pilasters which are notched to receive this headrail and fastened to pilaster by means of sheet metal screws. Headrail shall extend full length of installation and over end compartment and fastened into the wall by means of a bracket.

hardware and fittings—standard hardware shall be used with doors being mounted on brass chrome-plated brackets. Doors shall be equipped with concealed ball-bearing roller hinges. The upper pivot assembly shall be mounted in a recess in the edge of the door. Door shall be fitted with a combination keeper and bumper, slide latch and coat hook with rubber-tipped bumper. (Door pulls and two-prong coat hooks supplied with outswing doors.) Wall and panel brackets shall be manufactured of 12-gauge steel, enamelled to match partitions. Chrome-plated brackets optional.*** Latches, coat hooks and panel brackets supplied with chrome-plated theft-proof screws.

finish—all metal parts shall be thoroughly cleaned, leaving a phosphate deposit, primed with zinc chromate primer, and finished with two coats of baked-on enamel, in colors of user's choice, baked at 420°F.

NOTE—Where economy is a factor, wide door compartments are available with flush panels. Maximum width 34″, with 32″ doors. 1¼″ x 1⅞″ 16-gauge posts are also available in lieu of pilasters. Construction, hardware, fittings and finish are same as specified above.



TYPE ARP
PANEL TYPE

SPECIFICATIONS—general—All toilet compartments shall be Type "ARP" as manufactured by Robart Partitions, Inc.*

dividing panels—panels shall be constructed of single sheet, 16-gauge steel,** with a formed radius molding at top and bottom edge. Sheets shall be interlocked and welded to rear post. Front of panel shall have a ⅝″ flange for attaching the panel to the pilaster by means of self-tapping screws.

doors—doors shall be 1″ thick, fabricated of two sheets of 20-gauge stretcher-leveled furniture steel,** assembled over and cemented under pressure to a honeycomb core insulation. Face plates of the doors shall have formed edges sealed with continuous oval locking molding. Molding mitered and welded at corners, then ground smooth.

pilasters—pilasters shall be 1¼″ thick, 82″ high, fabricated of two sheets of 20-gauge steel welded together and finished in the same manner as doors. Pilasters to be internally reinforced with 16-gauge plates to receive self-tapping screws for panel connection. Pilasters to be securely anchored to the floor by fittings, providing for vertical adjustment for uneven floors.

headrail—pilasters to be securely braced with 1″ x 1½″ 16-gauge steel seamless rectangular tubing, continuous through the top of the pilasters, which are notched to receive this headrail and fastened by means of sheet metal screws. Headrail shall extend full length of installation and over end compartments and fastened into the wall by means of a bracket.

hardware and fittings—standard hardware shall be used with doors being mounted on brass chrome-plated brackets. Doors shall be equipped with concealed ball-bearing roller hinges. The upper pivot assembly shall be mounted in a recess in the edge of the door. Door shall be fitted with a combination keeper and bumper, slide latch and coat hook with rubber-tipped bumper. (Door pulls and two-prong coat hooks supplied with outswing doors.) Wall and panel brackets shall be manufactured of 12-gauge steel, enamelled to match partitions. Chrome-plated brackets optional.*** Latches, coat hooks and panel brackets supplied with chrome-plated theft-proof screws.

finish—all metal parts shall be thoroughly cleaned, leaving a phosphate deposit, primed with zinc chromate primer, and finished with two coats of baked-on enamel, in colors of user's choice, baked at 420°F.

NOTE—Where economy is a factor, wide door compartments are available with single sheet 16-gauge panels. Maximum width 34″, with 32″ doors. 1¼″ x 1⅞″ 16-gauge posts are also available in lieu of pilasters. Construction, hardware, fittings and finish are same as specified above.

TYPE AR AND ARP • SHOWER AND DRESSING COMPARTMENTS

SPECIFICATIONS—general—All shower and dressing rooms shall be Type "AR" or Type "ARP" as manufactured by Robart Partitions, Inc.*

compartments—both flush panel and pilaster, or post and panel shall be constructed of the same type material and in the same manner as specified for Type AR and ARP toilet compartments. These enclosures may be furnished with flush metal doors or shower curtains with roller curtain hooks. Hooks are provided to roll on standard headrail, eliminating special curtain rods. Doors, when required, shall be 1" thick, and shall be of the same design and construction as specified for flush doors and panels. Metal or wood seats shall be supplied to fit the various conditions when specified. Compartments may be installed on curb or floor with concealed fastenings.

finish—all metal parts shall be thoroughly cleaned, leaving a phosphate deposit, primed with zinc chromate primer, and finished with two coats of baked-on enamel, in user's choice of colors, baked at 420°F.

CONCEALED GRAVITY HINGE FOR TOILET PARTITION DOORS

This all new gravity-type hinge is simple, positive, quiet, durable, and is standard on all compartment doors. Robart engineers tested this newly designed hinge by mounting one, picked at random from the production line, on a 1¼ inch pilaster and a flush-type toilet enclosure door. The door was opened quickly by an air-actuated cylinder and allowed to close smoothly and silently by the action of the gravity hinge.

After 380,000 cycles of this operation, or the equivalent of 20 times a day for more than 52 years, the hinge was removed, disassembled and carefully examined. All parts were in perfect condition, without any signs of wear or fatigue. On the basis of this test result, we feel safe to say that this new hinge in normal use will outlast the life of the toilet compartment. It has no springs to wear out, nor does it require added lubricants.

COMPARE A FEW OF THESE FINE FEATURES

EASE OF INSTALLATION: Simply and quickly installed as a complete unit during erection at the site. No complicated directions to follow.

SIMPLICITY OF ADJUSTMENT: Only one adjustment to provide any desired position of the door when at rest. No cause for special tools or removal from the panel. Designed to indicate exactly the door's position of rest.

ARCHITECTURALLY ATTRACTIVE: Entire unit concealed inside the door panel for neat appearance. No projection of any parts below the bottom edge of the panel. Concealment affords protection to working parts against dust, moisture and vandalism.

STRUCTURALLY SOUND: An integral part of the door panel structure. Curled ends of hinge column strap butt solidly against the inside of the panel to provide additional rigidity. No possibility of panel bending inward when sex bolts are tightened.

WHY YOU CAN RELY ON ROBART

When you specify or order Robart Partitions you can be sure of exacting quality, complete service and prompt delivery. Robart makes metal toilet partitions only. Orders and production are handled on a simple "straight-line" basis. From top executives to shipping clerks, experienced personnel give their full, personal attention to each order. Nearby sales representatives give on-the-spot follow-up to each detail. You can really rely on Robart!

Sanymetal®

TOILET COMPARTMENTS

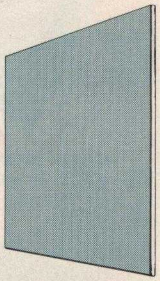
SHOWER STALLS

HOSPITAL CUBICLES

THE SANYMETAL PRODUCTS COMPANY, INC. • 1701 URBANA ROAD, CLEVELAND 12, OHIO

Quick Guide to DESIGNS and MATERIALS *offered by* Sanymetal®

ALL FLUSH CONSTRUCTION



All Sanymetal Compartments are now made with *FLUSH* insulated partitions, doors, and flush pilasters. NOTE flush, integral door hinge brackets, and flush-mounted, concealed latches.

The doors and partitions are 1″ thick; pilasters are 1¼″ thick. Each insulated with sound-deadening BRIDGECORE.

STANDARD MATERIALS AVAILABLE

STYLES AVAILABLE	**PORCENA** Vitreous porcelain on steel	**SYNTHETIC ENAMEL** Baked-on over GALVANIZED Bonderized* Steel	**SYNTHETIC ENAMEL** Baked-on over REGULAR Furniture Finish Cold-Rolled Steel
 **CENTURY** An off-the-floor ceiling hung design for reduced floor maintenance.	✓	✓	
 **NORMANDIE** A floor-supported compartment with clean lines that accentuate ceiling height.	✓	✓	
 **ACADEMY** Overhead braced, it can be installed easily in buildings new or old.	✓	✓	✓

*(Treated with Bonderite, a product of Parker Rust Proof Co.)

Sanymetal® NOW OFFERS ALL OTHER MATERIALS AND FINISHES

Including:

VINYL COATED STEEL — the exciting new textured finish that creates utterly different decorative treatment of toilet rooms — see page 18.

STAINLESS STEEL

MYLAR COATED STEEL

MONEL METAL

HAMMERED SURFACE STEEL

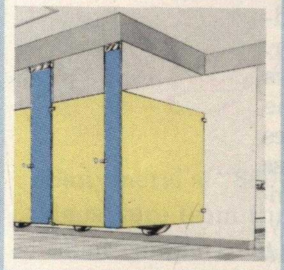
ALUMINUM

These can be furnished (as applicable) polished, natural finish, or colored, as you select for your installation.

Guide to information in this catalog

Due to design changes and availability of materials, and the development of new materials, the right is reserved to change materials, details of construction, and specifications.

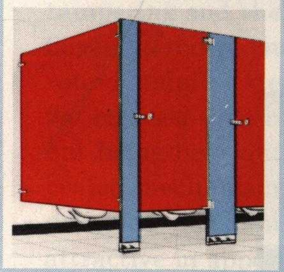
TOILET COMPARTMENTS



CENTURY type CEILING HUNG

Clear floor is easier to clean and maintain.

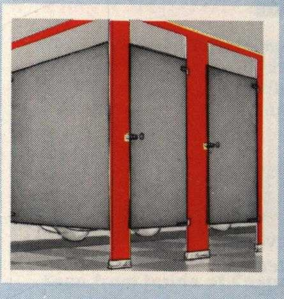
Illustration and details .... **page 6**
Specifications, Porcena & Baked Enamel .... **page 12**



NORMANDIE type FLOOR SUPPORTED

Appropriate if floor thickness permits installation of anchor bolts or concealed floor anchor plates.

Illustration and details .... **page 7**
Specifications, Porcena & Baked Enamel .... **page 13**



ACADEMY type OVERHEAD BRACED

Practical for any floor system.

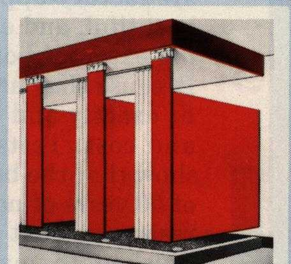
Illustration and details .... **page 8**
Specifications, Porcena & Baked Enamel .... **page 14**

JUNIOR HEIGHT PARTITIONS

Normandie design, scaled for children of elementary school age, permitting supervision.

Illustration and details .... **page 9**
Specifications, Porcena & Baked Enamel .... **page 13**

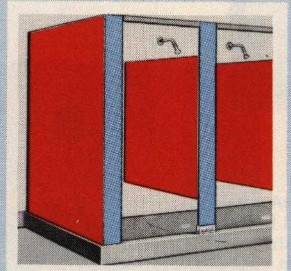
SHOWER COMPARTMENTS



CENTURY type CEILING HUNG

Suspended design reduces maintenance cost. (Base and curb to be furnished by others.)

Illustration .... **page 27**
Construction details .... **page 6**
Specifications, Porcena & Baked Enamel .... **page 12**



ACADEMY type OVERHEAD BRACED

End panels and pilaster extend down to curb. (Curb to be furnished by others.)

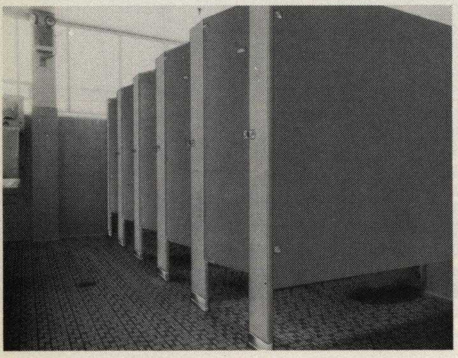
New INTEGRAL FACTORY-APPLIED HINGE BRACKETS

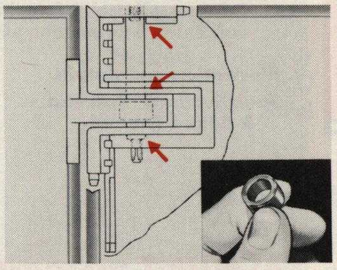


Beauty of Pilasters Increased by brackets which are integral, no hardware projects. Cleaning is easier, too.

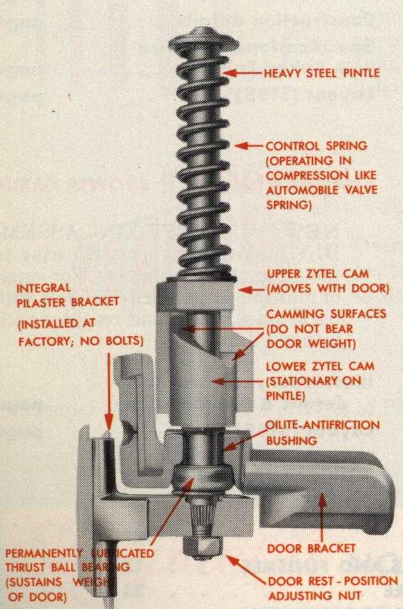
These new brackets are integral with the pilaster, and are factory-applied. They make compartments more beautiful, and easier to clean, by eliminating protruding external bolts and bracket parts on the pilaster. Because they are factory-applied, the brackets always fit exactly and they sharply reduce installation time and cost. Tests made by independent laboratories show that the brackets have a mechanical life in excess of 50 years of normal use. They are made of corrosion-resistant, heat treated high tensile aluminum alloy, finished to match the adjacent locking strip. *All Sanymetal Compartments are furnished with these new brackets.*

Quicker Installation because brackets are factory-applied. Alignment is always perfect, and there are no bolts to install.

Strong Sanymetal Hinge Brackets and Hinges easily maintain alignment even though a 240-pound man swings on the door. This strength defies vandalism and "playfulness."



Three-Point Support of top hinge (see arrows), develops the remarkable strength demonstrated at left. Hinge is bearingized and permanently lubricated.



HEAVY STEEL PINTLE
CONTROL SPRING (OPERATING IN COMPRESSION LIKE AUTOMOBILE VALVE SPRING)
UPPER ZYTEL CAM (MOVES WITH DOOR)
INTEGRAL PILASTER BRACKET (INSTALLED AT FACTORY; NO BOLTS)
CAMMING SURFACES (DO NOT BEAR DOOR WEIGHT)
LOWER ZYTEL CAM (STATIONARY ON PINTLE)
OILITE-ANTIFRICTION BUSHING
PERMANENTLY LUBRICATED THRUST BALL BEARING (SUSTAINS WEIGHT OF DOOR)
DOOR BRACKET
DOOR REST-POSITION ADJUSTING NUT

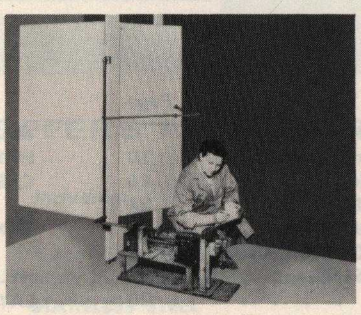
U. S. PAT. 2.876.874. CANAD. PAT. 581.353. OTHERS PEND.

INSIDE STORY *of "7950" Hinge shown in this picture with upper Zytel Cam and door bracket cutaway to show all moving parts.*

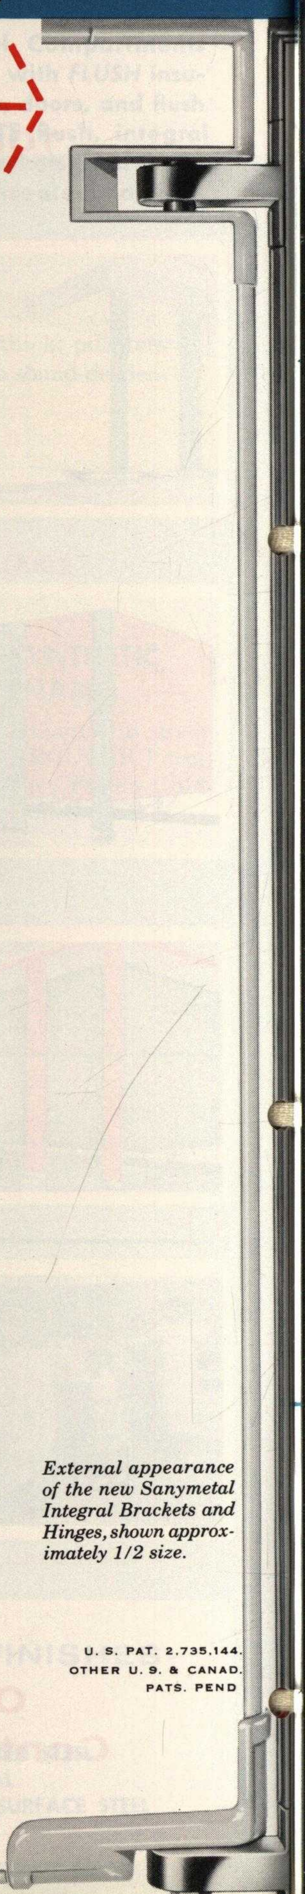
NEW "7950" CONCEALED BOTTOM HINGE

This hinge is wholly concealed in the door, and has the exclusive feature of *not causing the door to rise or lower when it is opened and closed.* Control is *not* dependent on door weight (a variable factor), but on a correctly designed spring, so the door always moves at a feather touch, always comes to rest at the point desired (set by an easy, quick adjustment). The weight of the door is carried on a thrust bearing, not on the control cams; this feature accounts for the long, trouble-free life of the unit. Zytel cams give the door the smoothest, quietest action, and endow the hinge with the longest life, obtainable from any material we have tested. In fact, this hinge has been tested on a door to over 1,000,000 swings without appreciable wear of any part! *Every Sanymetal Door is equipped with the Sanymetal "7950" Hinge.*

OPENED AND CLOSED OVER 1,000,000 TIMES – *no appreciable wear!*



To test the Sanymetal "7950" Hinge and new Integral Hinge Brackets, *an independent testing laboratory* chose a hinge at random from stock, mounted a standard Sanymetal door on the hinge in the regular way, and opened and closed the door over 1,000,000 times by mechanical means. (This is equal to 30 openings and closings per day for 91 years.) At the end of the test hinge and bracket parts were examined, and it was found that they had suffered no appreciable wear, and were in condition to continue functioning satisfactorily. The laboratory furnished affidavits to this effect.



External appearance of the new Sanymetal Integral Brackets and Hinges, shown approximately 1/2 size.

U. S. PAT. 2.735.144.

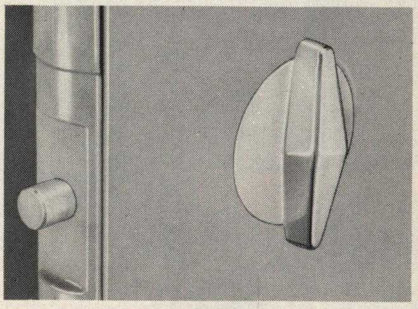
ENGINEERING ADVANCES...

The extra emphasis laid by Sanymetal on engineering, design, and selection of durable materials has resulted in a product unlike any other on the market. Note the greater beauty, lower installation cost, lower maintenance cost, and reduced long-run gross cost from Sanymetal compartments. These recent improvements are particularly important:

Sanymetal® "8800" Concealed Latch

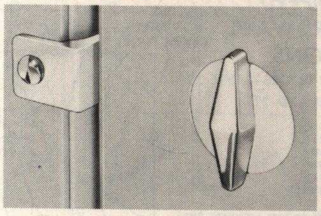
Sanymetal's "8800" Concealed Latch is a complete departure from the exposed slide-bolt hitherto used on toilet compartment doors. This new latch has no awkward external surfaces to collect grime. Its mechanism is completely concealed, making it fool-proof against tampering and theft. The smooth cam action works at finger-tip touch, and never requires lubrication. A heavy round stainless steel bolt is stronger than conventional flat exposed slide-bolts, to withstand terrific abuse without being bent out of line. Dirt can't get into the concealed mechanism to cause sticking. And like all well designed mechanisms, this latch and its keeper are attractive in appearance.



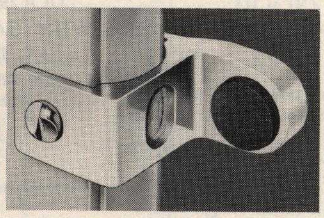
U. S. PAT. 2.876.873
CANAD. PAT. 581.354. OTHERS PEN

Concealed Latch Assembly — mechanism is concealed within the door, has mortised face plate, stainless steel bolt. Flush-mounted, finger-tip-control latch handle has back set of 2¾". Escutcheon and latch made forever theft-proof without the use of nuts or bolts.

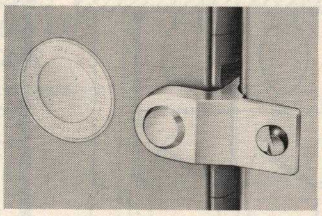
Every Sanymetal® door is fitted with the Sanymetal "8800" Latch.



Seen from Inside of Compartment —latch presents smooth flush lines and minimum projections. Latch handle operates with smooth cam action.



Keeper and Doorstop — of universal design, for in- or out-swinging, left or right doors. Keeper quickly applied with one theft-proof bolt, aligning positively without adjustment. Full ¾" rubber bumper held with concealed theft-proof device absorbs closing shock.



View from Outside of the Compartment — the attractive escutcheon plate is flush with the door. Exposed parts, made of strong non-ferrous castings heavily chrome-plated, will keep their beautiful lustre for the life of the compartment.

JUNIOR-HEIGH COMPARTMENT

Educators recommend properly scaled equipment for schools and institutions. An additional advantage of this design is the economy resulting from lower material, shipping, and handling costs, due to smaller size. Sanymetal Junior-Height Compartments are the same as the Normandie Type in quality and every other respect except dimensions. Panels and doors are at maximum 42″ high, set 12″ off the floor to produce a maximum overall height of 54″. These dimensions are in proportion to children up to the age of 12. Low overall height permits proper observation by supervisors, while affording child privacy from other children.

FOR SPECIFICATIONS SEE PAGE 13

(Recommended sizes of stall: Width 32″. Overall height, 54″ with 42″ high panel 12″ off the floor. Depth, 54″. Door width, 22″)

TYPE A:

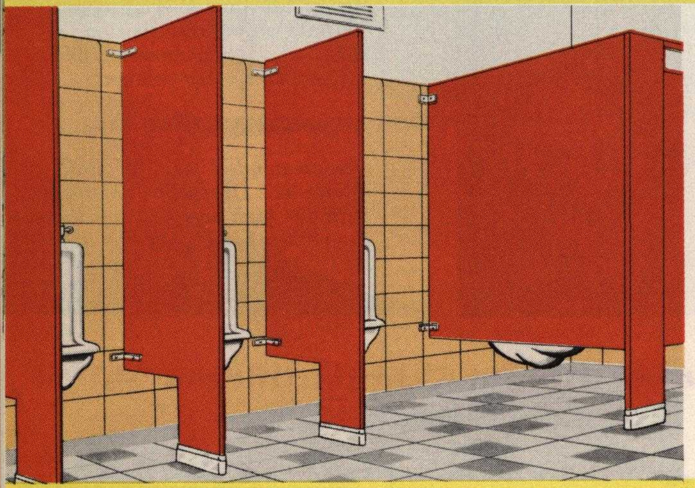
Wall Hung Flush Type

Sanymetal Wall Hung Urinal Screens are off the floor, saving time and expense for floor cleaning. They make thorough sanitation easier. For these reasons wall hung construction is always desirable, and *should be used* with off-the-floor compartments and fixtures. The flush panel, with integral flanges for attachment, is neat, simple, durable and attractive.

IMPORTANT: This screen must have secure anchorage to masonry wall, or to other types of walls adequately reinforced. See details at right. Consult Sanymetal for recommendations.

Standard Sizes: 18″ x 42″ or 24″ x 42″

FOR SPECIFICATIONS SEE PAGE 16



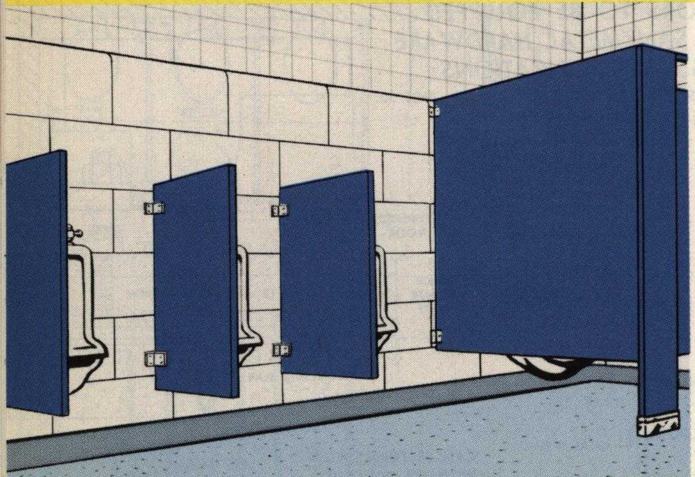
TYPE B:

Floor Supported Flush Type

Patterned to provide a "flat slab" appearance, with extra floor support to eliminate all overhead bracing. Heavy duty wall bracket attachments permit screen of maximum rigidity up to 36″ in depth.

IMPORTANT: This screen must have secure anchorage both to masonry wall and to floor, or with other types of construction adequate reinforcing must be provided to give secure anchorage. See details below. Consult Sanymetal for recommendations.

FOR SPECIFICATIONS SEE PAGE 16



TYPE C:

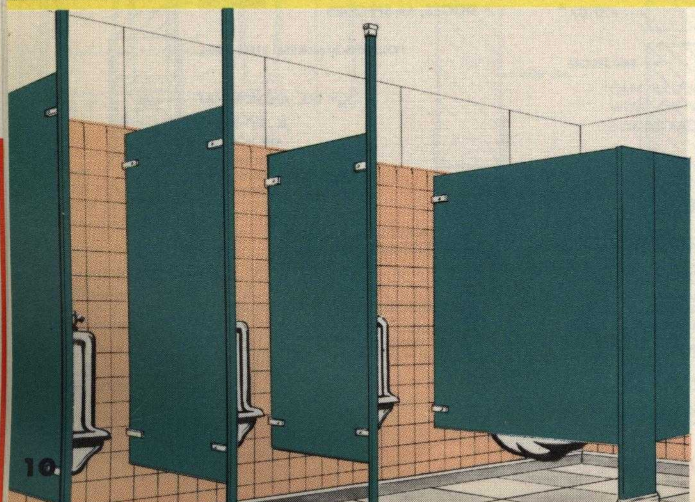
Wall Hung Bracket Supported

Type C Bracket Supported Screens offer advantages in cleaning and maintenance, and at less cost per unit. Rigid construction makes this screen a very sturdy and attractive unit.

IMPORTANT: Note attachment methods shown at extreme right. Consult Sanymetal for recommendations.

Standard Sizes: 18″ x 42″ or 24″ x 42″

FOR SPECIFICATIONS SEE PAGE 17



TYPE D:

Pilaster Braced Type

A practical design which can be used with all types of wall and floor construction, Type D is braced by a two-inch pilaster running from floor to ceiling.

Recommended Sizes:

18″, 24″, 30″, 36″, 42″, 48″, 54″, 57″ depths; 58″ high.

CENTURY TYPE Ceiling Hung

Architect's Note: Overhead structural provisions for suspending pilasters of Century Type (ceiling-hung) Toilet Compartments are provided by others. Sanymetal Engineers will recommend and detail the proper means for suspending pilasters from overhead carrying members. Sanymetal furnishes the anchor bolt layout required for fastening pilasters to structural members. Use these dimensions when designing overhead carrying member construction: Distance from finished floor to finish ceiling line from which pilasters are to be suspended shall not exceed 8 feet; recommended standard dimension is 7 feet, 6 inches (90 inches) overall.

Compartments are furnished with or without doors, as specified.

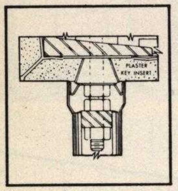
PORCENA

Vitreous Porcelain Enamel on Steel

SPECIFICATIONS

(1) All metal compartments for toilet, shower, and dressing rooms shall be Century Type (ceiling-hung) "Porcena" (vitreous porcelain on steel complying with Porcelain Enamel Institute standards for acid-resisting architectural porcelain enamel) as manufactured by Sanymetal Products Co., Inc. Bottom of door shall be on same horizontal plane as bottom of pilaster. Dimensions of partitions, doors, and pilasters are to comply with the modular system of dimensional coordination; compartment width variations to be obtained by using pilasters and doors of standard widths.

(2) Doors and partitions shall be 1″ thick, made of 2 sheets of vitreous porcelain sheet steel (minimum steel thickness: 18 gage) assembled over and cemented under pressure to dense, sound-deadening BRIDGECORE insulation. The two face plates on doors and partitions shall have formed edges, sealed with continuous oval-crown locking strips of 20 gage stainless steel, and edges shall be electrically welded together. Partitions and doors to be vitreous porcelain enameled on all interior and exterior surfaces, with color and finish coats of porcelain on exterior surfaces only.



(3) Suspended pilasters shall be 1-1/4″ thick of 2 sheets of vitreous porcelain 18 gage sheet steel welded together. Pilasters shall be secured to overhead carrying member (overhead members by others) by 7/16″ diameter galvanized bolts through 1/2″ x 7/8″ reinforced crossbar welded to and integral with the pilaster, with a plaster key spacer between bottom of supporting member and finished ceiling line, and designed to transmit the strain of lateral thrust and pull to the steel structural members independently of finished ceiling material.

(4) Hardware & Fittings: Dividing partitions and pilasters shall be attached to one another and to walls with brackets made of heat-treated, polished and anodized, extruded aluminum alloy; each stirrup bracket is to be 3″ long and is provided with holes for 4 attachment screws to wall. Attachment of the top of the pilaster to the ceiling shall be concealed with a 3″ polished stainless steel trim.

Doors shall be equipped with Sanymetal "7950" concealed, controlled gravity type hinges. Doors shall be mounted on upper and lower hinge pilaster brackets of heat-treated high-tensile cast aluminum alloy, chrome-plate finished, factory-mounted on the pilaster in position, and designed so that no bolts are externally visible, and no portion of the bracket overlaps the front or back external surfaces of the pilaster beyond the locking strip. Top hinge pivot door bracket to be recessed into edge of door approximately 2″ below top, with steel pivot pin, operating in an Oilite bearing, mounted within the door structure, supported both above and below the pivot bracket. Door weight shall be carried on a thrust bearing fixed in place by stationary vertical pintle concealed within the door structure. Operation of the door shall be controlled by opposing Zytel cams under spring tension, mounted on the fixed vertical pintle. Hinge to be adjustable to permit door to come to rest at any angle, or to hold door open or closed when not latched. Hinge to permit free movement without raising or lowering the door; all its moving parts to be self-lubricating, and to be completely concealed within the 1″ thickness of the door. Each door to be equipped with: a cast alloy, chrome-plated coat-hook and bumper applied with one-way head screw; a Sanymetal "8800" concealed latch, with face mortised flush with edging strip, and all working parts completely concealed within thickness of the door. Latch bolts shall be stainless steel, and exposed escutcheon plate and handle polished chrome-plated cast alloy non-ferrous metal. Provide on the pilaster a one-piece heavy cast non-ferrous alloy stop and keeper, chrome-plated and polished, with ¾″ diameter rubber bumper locked in place. Stop and keeper to be thru-bolted with one-way head sex bolts.

Hardware and Fittings illustrated on Page 21. End of Specifications for Century Porcena Compartment.

BAKED Synthetic ENAMEL

on Galvanized, Bonderized* Steel, or regular furniture finish cold-rolled steel

(Specify kind of steel desired. Sanymetal recommends galvanized, Bonderized steel for showers).*

SPECIFICATIONS

(1A) All metal compartments for toilet, shower, and dressing rooms shall be Century Type (ceiling-hung) with synthetic enamel baked-on over galvanized, Bonderized* steel as manufactured by The Sanymetal Products Co., Inc. Bottom of door shall be on same horizontal plane as bottom pilaster. Partitions, doors, and pilasters shall be made in dimensions that comply with the modular system of dimensional coordination; compartment width variations to be obtained by using pilasters and doors of standard widths.

(2A) Doors and partitions shall be 1″ thick made of 2 sheets of galvanized, Bonderized* steel (Minimum steel thickness: for doors — 22 gage; for partitions — 20 gage), assembled over and cemented under pressure to dense, sound-deadening BRIDGECORE insulation. The two face plates on doors and partitions shall have formed edges, sealed with continuous oval-crown locking strips, and door edges shall be electrically welded together. Locking strips on doors and partitions to be mitred and welded at corners.

(3A) Suspended Pilasters shall be made 1¼″ thick of 2 sheets of 16 gage steel, welded together and finished as specified for partitions and doors, including locking strip details. Pilasters shall be secured to overhead carrying member (overhead members by others) by means of ⁷⁄₁₆″ diameter galvanized bolts through a ½″ x ⅞″ reinforced crossbar welded to and integral with pilaster, with a plaster key spacer between bottom of supporting member and finished ceiling line, and designed to transmit the strain of lateral thrust and pull to the steel structural members independently of finished ceiling material.

(4A) Hardware & Fittings: Dividing partitions and pilasters shall be attached to one another and/or to walls with brackets made of heat-treated, polished and anodized extruded aluminum alloy. Attachment of the top of the pilaster to the ceiling shall be concealed with a 3″ polished stainless steel trim.

Doors shall be equipped with Sanymetal "7950" concealed, controlled gravity type hinges. Door shall be mounted on upper and lower hinge pilaster brackets of heat-treated high-tensile cast aluminum alloy, finished to match pilaster, factory-mounted on the pilaster in position, and designed so that no bolts are externally visible, and no portion of the bracket overlaps the front or back external surfaces of the pilaster beyond the locking strip. Top hinge pivot door bracket to be recessed into edge of door approximately 2″ below top, with steel pivot pin, operating in an Oilite bearing, mounted within the door structure, supported both above and below the pivot bracket. Door weight shall be carried on a thrust bearing fixed in place by stationary vertical pintle concealed within the door structure. Operation of the door shall be controlled by opposing Zytel cams under spring tension, mounted on the fixed vertical pintle. Hinge to be adjustable to permit door to come to rest at any angle, or to hold door open or closed when not latched. Hinge to permit free movement without raising or lowering the door, all its moving parts to be self-lubricating, and to be completely concealed within the 1″ thickness of the door. Each door to be equipped with: a cast alloy, chrome-plated coat-hook and bumper applied with one-way head screws; a Sanymetal "8800" concealed latch, with face mortised flush with edging strip, and all working parts completely concealed within the thickness of the door. Latch bolts shall be stainless steel, and exposed escutcheon plate and handle polished chrome-plated cast alloy non-ferrous metal. Provide on the pilaster a one-piece heavy cast non-ferrous alloy stop and keeper, chrome-plated and polished, with ¾″ diameter rubber bumper locked in place. Stop and keeper to be thru-bolted with one-way head sex bolts.

Hardware and Fittings illustrated on Page 21.

(5A) Finish shall consist of an Epon resin prime coat and a color synthetic finish coat of high-temperature baked-on enamel, applied by modern mechanical methods and baked-on to produce a uniform, smooth, lustrous, protective finish; all metal surfaces so finished shall have been sanded and thoroughly cleaned by methods recognized as good commercial finishing practice.

**Treated with Bonderite, a product of Parker Rust Proof Co.*

SPECIFICATIONS NORMANDIE TYPE Floor Supported

Architect's Note: Normandie (floor supported) Compartments are suitable for installation on floors constructed as illustrated on page 7. Depending on type of floor, specifications as follows should be inserted in space marked "X" in paragraph (3) or (3A) below:

For wood floors or wood sub-floors: "Through bolts and plate washers are to be furnished by the compartment manufacturer and installed by others before the underside of the floor construction is covered."

For concrete floors: "Anchorage to floor is to be by expansion shields and machine bolts."

For concrete slab: "Floor plate is to be supplied by compartment manufacturer and installed by others prior to applying fill and finished floor."

Before planning installations on other types of floor construction, consult your Sanymetal Representative.

Compartments are furnished with or without doors as specified.

BAKED Synthetic ENAMEL

on Galvanized, Bonderized* Steel, or regular furniture finish cold-rolled steel

(Specify kind of steel desired. Sanymetal recommends galvanized, Bonderized steel for showers.)*

SPECIFICATIONS

(1A) All metal compartments for toilet, shower, and dressing rooms shall be Normandie Type with synthetic enamel baked-on over galvanized, Bonderized* steel as manufactured by The Sanymetal Products Co., Inc. Top of door shall be on same horizontal plane as top of pilaster. Partitions, doors, and pilasters shall be made in dimensions that comply with the modular system of dimensional coordination; compartment width variations to be obtained by using pilasters and doors of standard widths.

(2A) Doors and partitions shall be 1″ thick made of 2 sheets of galvanized, Bonderized* steel (Minimum steel thickness: for doors – 22 gage; for partitions – 20 gage), assembled over and cemented under pressure to dense, sound-deadening BRIDGECORE insulation. The two face plates on doors and partitions shall have formed edges, sealed with continuous oval-crown locking strips, and door edges shall be electrically welded together. Locking strips on doors and partitions to be mitred and welded at corners.

(3A) Pilasters shall be made 1¼″ thick of 2 sheets of 16 gage steel, welded together and finished as specified for partitions and doors, including locking strip details. Pilasters shall be secured to concrete floor or concrete slab floor construction by means of 7/16″ diameter galvanized studs through a ½″ x ⅞″ reinforced crossbar welded to and integral with pilaster. *(X: Insert here specification for floor fastening appropriate to floor type, as given in "Architect's Note" above.)*

(4A) Hardware & Fittings: Attachment of dividing partitions and pilaster walls and/or pilasters shall be with extruded heat-treated polished and anodized aluminum alloy brackets. Attachment of pilasters to the floor shall be concealed with a 3″ polished stainles steel trim.

Doors shall be equipped with Sanymetal "7950" concealed, controlled gravity type hinges. Door shall be mounted on upper and lower hinge pilaster brackets of heat-treated high-tensile cast aluminum alloy, finished to match pilaster, factory-mounted on the pilaster in position, and designed so that no bolts are externally visible, and no portion of the bracket overlaps the front or back external surfaces of the pilaster beyond the locking strip. Top hinge pivot door bracket to be recessed into edge of door approximately 2″ below top, with steel pivot pin, operating in an Oilite bearing, mounted within the door structure, supported both above and below the pivot bracket. Door weight shall be carried on a thrust bearing fixed in place by stationary vertical pintle concealed within the door structure. Operation of the door shall be controlled by opposing Zytel cams under spring tension, mounted on the fixed vertical pintle. Hinge to be adjustable to permit door to come to rest at any angle, or to hold door open or closed when not latched. Hinge to permit free movement without raising or lowering the door; all its moving parts to be self-lubricating, and to be completely concealed within the 1″ thickness of the door. Each door to be equipped with: a cast alloy, chrome-plated coat-hook and bumper applied with one-way head screws; a Sanymetal "8800" concealed latch, with face mortised flush with edging strip, and all working parts completely concealed within the thickness of the door. Latch bolts shall be stainless steel, and exposed escutcheon plate and handle polished chrome-plated cast alloy non-ferrous metal. Provide on the pilaster a one-piece heavy cast non-ferrous alloy stop and keeper, chrome-plated and polished, with ¾″ diameter rubber bumper locked in place. Stop and keeper to be thru-bolted with one-way head sex bolts.

(5A) Finish shall consist of an Epon resin prime coat and a color synthetic finish coat of high-temperature baked-on enamel, applied by modern mechanical methods and baked-on to produce a uniform, smooth, lustrous, protective finish; all metal surfaces so finished shall have been sanded and thoroughly cleaned by methods recognized as good commercial finishing practice.

PORCENA

Vitreous Porcelain Enamel on Steel

SPECIFICATIONS

(1) All metal compartments for toilet, shower, and dressing rooms shall be Academy Type (overhead-braced) "Porcena" (vitreous porcelain on steel complying with Porcelain Enamel Institute standards for acid-resisting architectural porcelain enamel) as manufactured by Sanymetal Products Co., Inc. Dimensions of partitions, doors, and pilasters are to comply with the modular system of dimensional coordination; compartment width variations to be obtained by using pilasters and doors of standard widths.

(2) Doors and partitions shall be 1″ thick, made of 2 sheets of vitreous porcelain sheet steel (Minimum steel thickness: 18 gage) assembled over and cemented under pressure to dense, sound-deadening BRIDGECORE insulation. The two face plates on doors and partitions shall have formed edges, sealed with continuous oval-crown locking strips of 20 gage stainless steel, and edges shall be electrically welded together. Partitions and doors to be vitreous porcelain enameled on all interior and exterior surfaces, with color and finish coats of porcelain on exterior surfaces only.

(3) Pilasters shall be 1-1/4″ thick of 2 sheets of vitreous porcelain 18 gage sheet steel welded together. Pilasters are to extend in height from floor to headrail. Bottom of pilasters shall have a jack leveling-screw to carry the weight of the compartment, and to provide secure anchorage to the floor with fittings providing for vertical adjustment.

(4) Headrail: Partitions and pilasters, when set in place, shall be securely braced with continuous 1″ x 1-1/2″ tubular stainless steel overhead bracing attached through top of pilasters and bolted to the pilasters; this headrail shall extend full length of installation and over end compartment and be fastened into wall bracket. Exposed ends of headrail are to be capped.

(5) Hardware & Fittings: Dividing partitions and pilasters shall be attached to one another and to walls with brackets made of heat treated, polished and anodized extruded, aluminum alloy; each stirrup bracket is to be 3″ long and provided with holes for 4 attachment screws to wall. Attachment of the pilaster to the floor shall be concealed with a 3″ polished stainless steel trim.

Doors shall be equipped with Sanymetal "7950" concealed, controlled gravity type hinges. Door shall be mounted on upper and lower hinge pilaster brackets of heat-treated high-tensile cast aluminum alloy, chrome-plate finished, factory-mounted on the pilaster in position, and designed so that no bolts are externally visible, and no portion of the bracket overlaps the front or back external surfaces of the pilaster beyond the locking strip. Top hinge pivot door bracket to be recessed into edge of door approximately 2″ below top, with steel pivot pin, operating in an Oilite bearing, mounted within the door structure, supported both above and below the pivot bracket. Door weight shall be carried on a thrust bearing fixed in place by stationary vertical pintle concealed within the door structure. Operation of the door shall be controlled by opposing Zytel cams under spring tension, mounted on the fixed vertical pintle. Hinge to be adjustable to permit door to come to rest at any angle, or to hold door open or closed when not latched. Hinge to permit free movement without raising or lowering the door; all its moving parts to be self-lubricating, and to be completely concealed within the 1″ thickness of the door. Each door to be equipped with: a cast alloy, chrome-plated coat-hook and bumper applied with one-way head screws; a Sanymetal "8800" concealed latch, with face mortised flush with edging strip, and all working parts completely concealed within the thickness of the door. Latch bolts shall be stainless steel, and exposed escutcheon plate and handle polished chrome-plated cast alloy non-ferrous metal. Provide on the pilaster a one-piece heavy cast non-ferrous alloy stop and keeper, chrome-plated and polished, with ¾″ diameter rubber bumper locked in place. Stop and keeper to be thru-bolted with one-way head sex bolts.

End of Specifications for Academy Porcena Compartment.

Compartments are furnished with or without doors as specified.

BAKED Synthetic ENAMEL

on Galvanized, Bonderized* Steel, or regular furniture finish cold-rolled steel

(Specify kind of steel desired. Sanymetal recommends galvanized, Bonderized steel for showers.)*

SPECIFICATIONS

(1A) All metal compartments for toilet, shower, and dressing rooms shall be Academy Type *(if galvanized, Bonderized* steel so specify; otherwise regular furniture finish cold rolled steel will be used)* as manufactured by The Sanymetal Products Co., Inc. Partitions, doors, and pilasters shall be made in dimensions that comply with the modular system of dimensional coordination; compartment width variations to be obtained by using pilasters of standard widths, and doors not to exceed 24″ in width.

(2A) Doors and partitions shall be 1″ thick made of 2 sheets of steel (minimum steel thickness: for doors — 22 gage; for partitions — 20 gage), assembled over and cemented under pressure to dense, sound-deadening BRIDGECORE insulation. The two face plates on doors and partitions shall have formed edges, sealed with continuous oval-crown locking strips, and door edges shall be electrically welded together. Locking strips on doors and partitions to be mitred and welded at corners.

(3A) Pilasters shall be made 1-1/4″ thick of 2 sheets of 20 gage steel, welded together and finished as specified for partitions and doors, including locking strip details. Pilasters are to extend in height from floor to headrail. Bottom of pilasters shall have a jack leveling-screw to carry the weight of the compartment, and to provide secure anchorage to the floor with fittings providing for vertical adjustment.

(4A) Headrail: Partitions and pilasters, when set in place, shall be securely braced with continuous 1″ x 1-1/2″ tubular steel overhead bracing, attached through top of pilasters and bolted to the pilasters, and finished in synthetic enamel baked-on; this headrail shall extend full length of installation and over end compartment and be fastened into wall bracket. Exposed ends of headrail are to be capped.

(5A) Hardware & Fittings: Dividing partitions and pilasters shall be attached to one another and to walls with brackets made of heat treated, polished and anodized, extruded aluminum alloy. Attachment of pilaster to the floor shall be concealed with a 3″ polished stainless steel trim.

Doors shall be equipped with Sanymetal "7950" concealed, controlled gravity type hinges. Door shall be mounted on upper and lower hinge pilaster brackets of heat-treated high-tensile cast aluminum alloy, finished to match pilaster, factory-mounted on the pilaster in position, and designed so that no bolts are externally visible, and no portion of the bracket overlaps the front or back external surfaces of the pilaster beyond the locking strip. Top hinge pivot door bracket to be recessed into edge of door approximately 2″ below top, with steel pivot pin, operating in an Oilite bearing, mounted within the door structure, supported both above and below the pivot bracket. Door weight shall be carried on a thrust bearing fixed in place by stationary vertical pintle concealed within the door structure. Operation of the door shall be controlled by opposing Zytel cams under spring tension, mounted on the fixed vertical pintle. Hinge to be adjustable to permit door to come to rest at any angle, or to hold door open or closed when not latched. Hinge to permit free movement without raising or lowering the door, all its moving parts to be self-lubricating, and to be completely concealed within the 1″ thickness of the door. Each door to be equipped with: a cast alloy, chrome-plated coat-hook and bumper applied with one-way head screws; a Sanymetal "8800" concealed latch, with face mortised flush with edging strip, and all working parts completely concealed within the thickness of the door. Latch bolts shall be stainless steel, and exposed escutcheon plate and handle polished chrome-plated cast alloy non-ferrous metal. Provide on the pilaster a one-piece heavy cast non-ferrous alloy stop and keeper, chrome-plated and polished, with ¾″ diameter rubber bumper locked in place. Stop and keeper to be thru-bolted with one-way head sex bolts.

Hardware and Fittings illustrated on Page 21.

(6A) Finish shall consist of an Epon resin prime coat and a color synthetic finish coat of high-temperature baked-on enamel, applied by modern mechanical methods and baked-on to produce a uniform, smooth, lustrous, protective finish; all metal surfaces so finished shall have been sanded and thoroughly cleaned by methods recognized as good commercial finishing practice.

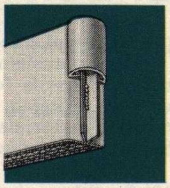
TYPICAL OPEN SPECIFICATIONS

CEILING HUNG

(Porcelain Enamel Finish)

(1) All metal compartments for toilets, showers and dressing rooms shall be Vitreous Porcelain Enamel Flush Type, Ceiling-Hung, with pilaster fronts.

(2) Partitions shall be 1″ thick made of two sheets of enameling iron assembled over and cemented under pressure to a dense sound-deadening BRIDGECORE mould of 20 gage polished stainless steel on all four sides with finished corners. Partitions sheets to be welded together at intervals around the edges prior to application of mould.



(3) Doors shall be same construction as panels but in addition, edges of face sheets to be welded at intervals to insure rigidity and prevent wind. Doors shall be approximately 24″ wide and swing into the compartment.

(4) Pilasters to be the same construction as the doors except that they will be 1-1/4″ thick, with reinforcement to receive dividing partition connection. The pilasters shall be anchored to the overhead carrying member by means of 7/16″ diameter galvanized studs through a 1/2″ x 1″ reinforced crossbar welded and made integral with top of the pilaster. Pilaster moulding on vertical edges and bottom edge to be polished stainless steel.

(5) Ceiling anchorage: Structural members to support toilet compartment shall be fabricated, installed and furnished under another section of the specifications. Pilasters shall be through-bolted to structural members by two 7/16″ stud bolts, except where pilasters are fastened to a wall, in which case only one stud bolt is required. Insert plaster keys shall be furnished by the toilet compartment manufacturer of a depth equal to the total distance from the structural supporting member to the finished plaster surface.

(6) Materials: All steel shall be enameling iron of the following gages:

Partitions - 18 gage minimum
Pilasters - 18 gage minimum
Doors - 18 gage minimum
Reinforcing Channels - 16 and 14 gage, galvanized-Bonderized* steel

(7) Hardware and Fittings: (7-A) *Brackets* — both wall and pilaster stirrup brackets to be non-ferrous, bright finish. **(7-B) *Pilasters Ceiling Trim*** — 3″ high stainless steel. **(7-C) *Hinges*** — Doors shall be hung on gravity hinges having roller bearings on cams, adjustable to permit doors to be set either self-closing, self-opening or ajar, and operating parts encased or contained within the door. Both upper and lower brackets of hinge are to consist of cast alloy non-ferrous metal with chrome-plated finish. Upper pivot guide pin shall be secured above and below the bearing point of door, with bearing concealed in top bracket that fits into a cut-out near the top of door. Compensation for travel of roller on cam shall be by vertical movement of door or by compressive spring action. Ball bearing rollers and cams shall be hardened steel. All moving parts shall operate in self-lubricating or self-contained ball thrust bearings. **(7-D) *Coat Hooks, Latches, Bumpers*** — Each door to be equipped with one cast alloy chrome-plated coat hook and bumper; one cast alloy chrome-plated slide bar latch; and, for each door, one heavy cast alloy, chrome-plated combination door stop and latch keeper to be securely attached to the pilaster at a point opposite the slide bar latch on the door.

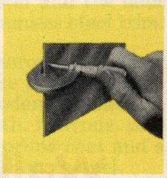
(8) Finish and Color: All doors, partitions and pilasters shall be acid resisting, vitreous porcelain on steel in accordance with Porcelain Enamel Institute standards for architectural porcelain enamel; vitreous porcelain shall be glass-like substance composed of inorganic mineral materials and produced by firing. Two colors to be selected from manufacturer's color chart.

(9) Manufacturer: The partitions to be Sanymetal "PORCENA", Century Flush Type as manufactured by The Sanymetal Products Company, Inc., 1705 Urbana Road, Cleveland 12, Ohio, or any other national distributed manufacturer of recognized quality, providing they are equal in the opinion of the architect to those specified.

HEAD RAIL BRACED

(Baked Enamel Finish)

(1) All metal compartments for toilets, shower and dressing rooms shall be flush type with pilaster fronts, headrail braced construction.



(2) Partitions: Shall be 1″ thick made of two sheets of stretcher leveled furniture steel assembled over and cemented under pressure to a dense sound-deadening insulating BRIDGECORE; the sheets to have edges formed to take a continuous oval shape crown locking mould on all four sides with corners mitred, welded and ground smooth.

(3) Doors: Shall be same construction as panels but in addition edges of face sheets to be welded at intervals to insure rigidity and prevent wind. Doors shall be approximately 24″ wide and swing into the compartment.

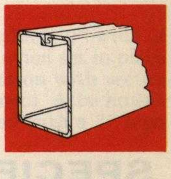
(4) Pilasters: To be the same construction as the doors except that they will be 1¼″ thick, with reinforcement to receive dividing partition connection and with mould on vertical edges only. Pilasters shall be anchored to the floor by means of a fitting providing for vertical adjustment by direct mechanical means and not depend upon friction to hold the vertical adjustment.

(5) Headrail: Pilasters shall be securely braced with continuous 1″ x 1½″ tubular steel overhead bracing (either lock seam or continuous welded) through the top of the pilasters. Headrail shall extend the full length of the installation and over any free standing end partition and be fastened into a cast alloy wall bracket.

(6) Materials: All steel shall be (galvanized-Bonderized*) stretcher leveled furniture steel of the following gages:

Partitions - 20 gage
Pilasters - 20 gage
Doors - 22 gage
Headrail - 20 gage
Reinforcing Channels - 16 and 14 gage

(7) Hardware and Fittings: (7-A) *Brackets*—both wall and pilaster stirrup brackets to be extruded or cast with polished finish. **(7-B) *Pilaster Floor Trim***—3″ high stainless steel. **(7-C) *Hinges***—Doors shall be hung on gravity hinges having roller bearings on cams, adjustable to permit doors to be set either self-closing, self-opening, or ajar, with operating parts encased or contained within the door. Upper pivot guide pin shall be secured above and below the bearing point of door, with bearing concealed in top bracket that fits into a cut-out near the top of door. Compensation for travel of roller on cam shall be by vertical movement of door or by compressive spring action. Ball bearing rollers and cams shall be hardened steel. All moving parts shall operate in self-lubricating, needle or self-contained ball thrust bearings. **(7-D) *Coat Hooks, Latches, Bumpers*** — Each door to be equipped with one cast alloy chrome-plated coat hook and bumper; one cast alloy concealed or exposed latch, with chrome-plated stop and keeper. Coat hook to be applied with screws having one-way heads. Balance of hardware to be applied with Phillip Head Screws.



(8) Finish and Color: All surfaces to be cleaned and sanded smooth, preparatory to application of synthetic enamel, applied in two coats, by modern mechanical methods, baked to a uniform, smooth, lustrous, protective finish. Two colors to be selected from manufacturer's color chart.

(9) Manufacturer: The partitions to be Sanymetal Academy Flush type, as manufactured by The Sanymetal Products Company, Inc., 1705 Urbana Road, Cleveland, Ohio, or any other national distributed manufacturer of recognized quality, providing they are equal in the opinion of the architect to those specified.

SPECIFICATIONS URINAL SCREENS

PORCENA

(Vitreous Porcelain on Steel)

TYPE A:

Wall Hung Flush Type

SPECIFICATIONS

(1) All urinal screens shall be Wall Hung Flush Type "Porcena" (vitreous porcelain on steel in accordance with Porcelain Enamel Institute standards for acid-resisting architectural porcelain; vitreous porcelain shall be a glass-like substance composed of inorganic mineral materials and produced by firing) as manufactured by The Sanymetal Products Co., Inc., Cleveland, Ohio.

(2) Partitions shall be 1¼ inches thick made of two sheets of No. 16 gage vitreous porcelain sheet steel, with edges formed, assembled over and cemented under pressure to a dense, sound-deadening BRIDGECORE insulation. The two face plates on partitions shall have formed edges and shall be electrically welded together and sealed with continuous oval-crown locking strips of No. 20 gage stainless steel. Partitions to be vitreous porcelain enameled on all interior and exterior surfaces only, with binding strips of No. 20 gage stainless steel. Partitions to be made in dimensions that comply with the modular system of dimensional coordination. Partitions to have integral, formed, reinforced mounting flanges.

TYPE B:

Floor supported Flush Type

Architect's Note: When fastening to a solid concrete floor, machine bolts and expansion shields are installed. On concrete slab having cinder fill greater than 1¼ inches thick, and finished floor construction, anchor plates furnished by Sanymetal are to be installed by the customer before fill and finished floor material are applied, in accordance with directions by Sanymetal. For installation on wood floors or wood subfloors, Sanymetal will furnish throughbolts and plate washers to be applied by customer before the underside of the floor construction is covered. Before planning installation on other types of floor construction, consult Sanymetal Representative.

SPECIFICATIONS

(1) All urinal screens shall be Floor Supported Flush Type "Porcena" (vitreous porcelain on steel in accordance with Porcelain Enamel Institute standards for acid-resisting architectural porcelain enamel; vitreous procelain shall be a glass-like substance composed of inorganic mineral materials and produced by firing) as manufactured by The Sanymetal Products Co., Inc., Cleveland, Ohio.

(2) Partitions shall be 1¼ inches thick, made of two sheets of No. 16 gage vitreous porcelain sheet steel, with edges formed, assembled over and cemented under pressure to a dense, sound-deadening BRIDGECORE insulation. The two face plates on Partitions shall have formed edges and shall be electrically welded together and sealed with continuous oval-crown locking strips of No. 20 gage stainless steel. Partitions to be vitrous porcelain enameled on all interior and exterior surfaces only, with binding strips of No. 20 gage stainless steel. Partitions to be made in dimensions that comply with the modular system of dimensional coordination.

(3) The leg extension to the floor shall be 1¼" thick, integral with and flush with panel above. Leg extensions, when set in place, shall be securely anchored by means of ⁷⁄₁₆" diameter galvanized studs through (⅛" x ⅞") reinforced cross bar, welded and made integral with pilaster. If anchored by use of floor plate, (see detail of construction) floor plate is to be furnished by screen manufacturer and to be installed by others prior to applying fill and finished floor.

(4) Hardware: Partitions shall be attached to wall with non-ferrous, chrome-plated stirrup brackets. The base of the pilaster and the floor anchorage shall be concealed by a 3-inch polished stainless steel trim.

End of specification for "PORCENA"

BAKED Synthetic ENAMEL

(Galvanized, Bonderized* Steel finished with Synthetic Enamel Baked-on)

TYPE A:

SPECIFICATIONS

(1) All urinal screens shall be Wall Hung Flush Type made from galvanized, Bonderized* steel finished with Synthetic Enamel Baked-on, as manufactured by The Sanymetal Products Co., Inc., Cleveland, Ohio.

(2) Partitions shall be 1¼ inches thick made of two sheets of No. 20 gage galvanized, Bonderized* steel, assembled over and cemented under pressure to a dense, sound-deadening BRIDGECORE insulation. The two face plates on partitions shall have formed edges and shall be electrically welded together and sealed with continuous oval-crown locking strips; interlocking strips on partitions mitred and welded at the corners. Partitions to be made in dimensions that comply with the modular system of dimensional coordination. Partitions to have integral, formed, reinforced mounting flanges.

TYPE B:

SPECIFICATIONS

(1) All urinal screens shall be Floor Supported Flush Type made from galvanized, Bonderized* steel finished with Synthetic Enamel Baked-on, as manufactured by The Sanymetal Products Co., Inc., Cleveland, Ohio.

(2) Partitions shall be 1¼ inches thick made of two sheets of No. 20 gage galvanized, Bonderized* steel, assembled over and cemented under pressure to a dense, sound-deadening BRIDGECORE insulation. The two face plates shall have formed edges and shall be electrically welded together and sealed with continuous oval-crown locking strips; interlocking strips on partitions mitred and welded at corners. Partitions to be made in dimensions that comply with the modular system of dimensional coordination.

MATERIALS . . . . Page 18
COLORS . . . . Page 20

TYPE A:

SPECIFICATIONS *(continued)*

(3) Finish: All metal surfaces shall be sanded and thoroughly cleaned by methods recognized as good commercial practice in preparation for synthetic enamels which are to be applied by modern mechanical methods and baked-on to provide a uniform, smooth, lustrous, protective finish, which shall consist of an Epon resin prime coat and a color synthetic finish coat of high-temperature baked-on enamel.

TYPE B:

SPECIFICATIONS *(continued)*

(3) Leg extensions to the floor shall be 1¼ inches thick, integral and flush with the panel above. Leg extensions, when set in place, shall be securely anchored by means of 7/16″ diameter galvanized studs through (½″ x ⅞″) reinforced cross bar, welded and made integral with pilaster. If anchored by use of floor plate, (see detail of construction) floor plate is to be furnished by screen manufacturer and to be installed by others prior to applying fill and finished floor.

(4) Hardware: Partitions shall be attached to wall with non-ferrous brackets enameled to match. The base of the pilaster and the floor anchorage shall be concealed by a 3-inch polished stainless steel trim.

(5) Finish: All metal surfaces shall be sanded and thoroughly cleaned by methods recognized as good commercial practice in preparation for synthetic enamels which are to be applied by modern mechanical methods and baked-on to provide a uniform, smooth, lustrous, protective finish, which shall consist of an Epon resin prime coat and a color synthetic finish coat of high-temperature baked-on enamel.

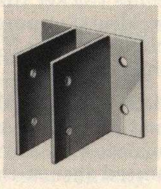
TYPE C:

Wall Hung Bracket Supported

SPECIFICATIONS

(Galvanized, Bonderized* Steel finished with Synthetic Enamel Baked-on)

(1) All urinal screens shall be Wall-Hung Flush Type made of galvanized, Bonderized* steel, finished with synthetic enamel baked-on as manufactured by The Sanymetal Products Co., Inc. Cleveland, Ohio.



(2) Partitions shall be 1″ thick made of 2 sheets of #20 gauge galvanized, Bonderized* steel, assembled over and cemented under pressure to a dense sound-deadening Bridgecore insulation. The two face plates of the partitions shall have formed edges and shall be electrically welded together at approximately 18″ intervals and sealed with continuous oval-crown locking strips, with the locking strips mitred and welded and finished at the corners. Both vertical edges of the panel are to be supplied with additional reinforcement consisting of a wood core 4″ wide.

(3.) Fittings: Partitions shall be attached to the wall with 2 brackets made of heat-treated, polished and anodized extruded aluminum alloy. Each stirrup bracket shall be 3″ long and provided with 4 holes for attachment of screws to the wall and 2 thru-bolts through the partition.

(4.) Finish: All metal surfaces shall be sanded and thoroughly cleaned by methods recognized as good commercial practice in preparation for synthetic enamels which are to be applied by modern mechanical methods and baked-on to provide a uniform, smooth, lustrous protected finish, which shall consist of an Epon resin prime coat and a color synthetic finish coat of high-temperature baked-on enamel.

TYPE D:

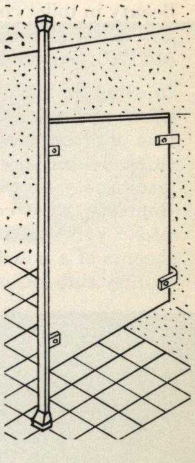
Pilaster Braced Type

SPECIFICATIONS

(Galvanized, Bonderized* Steel finished with Synthetic Enamel Baked-on)

(1.) All urinal screens shall be Flush Type with 2″ wide pilaster running from floor to finished ceiling, as manufactured by the Sanymetal Products Co., Inc.

(2.) Partitions shall be 1″ thick made of 2 sheets of galvanized, Bonderized* steel, 20 gauge, assembled over and cemented under pressure to dense, sound-deadening Bridgecore insulation. The two face plates of the partition shall have formed edges sealed with continuous oval-crown locking strip and shall be electrically welded together. Locking strip on partitions to be mitred and welded and finished at corners.



(3.) Floor to ceiling pilasters shall be made 1¼″ thick, 2″ wide of #18 gauge galvanized, Bonderized* steel. Pilasters when set in place shall be secured to the floor and ceiling construction with secure anchorage and fittings providing for vertical adjustment. Attachment of pilaster to the floor and ceiling shall be concealed with a 3″ high polished stainless steel trim.

(4.) Fittings: Partitions and pilasters shall be attached to one another and to the walls with brackets made of heat-treated, polished and anodized, extruded aluminum alloy. Brackets shall be 1¼″ long.

(5) Finish shall consist of an Epon resin prime coat and a color synthetic finish coat of high-temperature baked-on enamel applied by modern mechanical methods and baked-on to produce a uniform, smooth, lustrous and protected finish. All metal surfaces shall have been sanded and thoroughly cleaned by methods recognized as good commercial finishing practice.

Sanymetal® Offers You the Most in

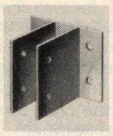
SANYMETAL PORCENA... Porcelain Enamel for Toilet Compartments Brought to Perfection by Experience

You can have confidence that Sanymetal PORCENA will give you all the advantages you expect from vitreous porcelain enamel on steel. Specifically, it assures you of these advantages:

1. Bright, true colors that will not fade.
2. A grade of porcelain unaffected by acids, cleaning compounds, oil and grease, and other agents encountered in normal use.
3. Design and handling are such that the porcelain gives full protection over every bit of the steel surface, both exposed and hidden, without breaks caused by drilling, overstress from fasteners, or other preventable factors.
4. Flat surfaces, without buckle or warp, on doors, partitions, and pilasters.
5. Hardware correctly designed to support the weight of porcelain enamel on steel.

Genuine
PORCELAIN ENAMEL
ACID RESISTING
PORCELAIN ENAMEL
TO CLEAN

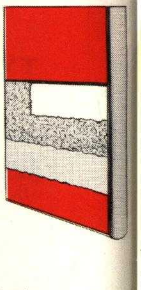
Porcelain Enamel Institute "Lifetime Finish" label carried by Porcena.



Brackets, hinges, and other hardware used with Sanymetal PORCENA are designed to carry the weight of porcelain enamel properly, without overstressing or failure.

Only from Sanymetal do you have the assurance of getting these advantages backed by 24 years of experience. Sanymetal has produced over 2,500 porcelain enamel toilet compartment installations since 1936, when Sanymetal pioneered this material for compartment construction. Not one Sanymetal installation has ever faded, failed, or required repair or replacement due to lack of durability. Every Sanymetal job today carries the Porcelain Enamel Institute "Lifetime Finish" label for acid-resisting porcelain enamel.

Select PORCENA and you will be sure of the everlasting beauty, the durability, the low cleaning cost and freedom from maintenance cost which you want. Its glass-hard, glass-smooth surface is impervious to odors, unaffected by moisture, cleaning compounds, uric acid, pencil marks, lipstick, ink. It reduces maintenance costs to a minimum because it never needs to be refinished, and because it is easily cleaned bright as new by soap and water.



Quality materials, quality methods make PORCENA top quality: (1) Genuine heavy gage enameling iron etched for ground coat; (2) Porcelain Enamel ground co over whole surfa (3) Porcelain Enam color coat on visible surfaces.

SANYVINYL-METAL Vinyl Coated Steel...

Opens Exciting New Possibilities for Toilet Room Design!

Beauty in toilet compartments, beyond the range of possibilities with any material before offered, is easily attained with SANYVINYL-METAL, Sanymetal's Vinyl Coated Steel.

In using SANYVINYL-METAL you get *texture, color, decorative effect,* and above all, a feeling of warmth and softness. The luxurious impression made is appropriate for the finest installations in clubs, deluxe hotels, monumental public buildings and schools, fine restaurants, executive office suites, and other outstanding projects. Representative colors and textures shown below illustrate how SANYVINYL-METAL patterns may be chosen to blend with the accents of a powder room, or with the masculine atmosphere of a country club locker room.

Easy Maintenance, Low in Cost: In durability SANYVINYL-METAL stands midway between everlasting porcelain enamel, and baked synthetic enamel which requires regular, periodic refinishing. The tough, impervious VINYL plastic surface requires no regular maintenance other than washing with soap and water. It is not affected by moisture, common cleaning compounds, uric acid, greases, oils, lipstick, and it resists defacement by pencil marks, ink, etc. Because it is many times thicker than baked enamel, it is less likely to be damaged by accidental or intentional scratching with a sharp point. Under normal circumstances it should last many, many years with no care other than cleaning.

SANYVINYL-METAL is produced by a process which employs heat and pressure to achieve a permanent bond, making the heavy vinyl surface virtually an integral part of the steel. It is absolutely guaranteed against the separation blistering or flaking in normal service.

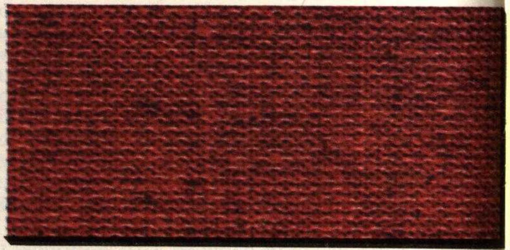
Salt and Pepper – **PC 402**



Flame Red – **PC 401**

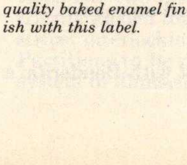
SANYMETAL SYNTHETIC ENAMEL...Baked-on over...

...Galvanized, Bonderized* Steel

A distinctive feature of Sanymetal Synthetic Enamel is the use of Epon synthetic resin primer, which greatly increases service life. In addition, galvanizing and Bonderizing* make the finish last 2 to 3 times longer than equivalent enamel over cold-rolled steel.

To produce the highest quality of finish, Sanymetal employs automatic, electrostatic spraying equipment. For maintenance of the hard, lustrous finish, just wash and wax. For repairs or refinishing, DuPont air-drying enamels in matching colors are available (see p. 20).

**Treated with Bonderite a product of Parker Rust Proof Co.*



GALVANIZED
and BONDERIZED
For Longer Life and Lasting Qualities
Sanymetal
PRODUCTS CO., INC. • CLEVELAND 12, OHIO

Sanymetal identifies top quality baked enamel finish with this label.

Furniture Finish Cold-Rolled Steel

For this finish, the Epon primer, top coat enamel, and equipment are the same as those used for the galvanized, Bonderized finish. Due, however, to the reduced protection to the base metal, this finish is not recommended for severe service, and any scratches or mars penetrating the protective enamel should be repaired at once.

"BRIDGECORE" another Sanymetal Engineering Innovation Makes Panel Structure STRONGER, LIGHTER, LONGER LASTING

More strength more rigidity are now built into every Sanymetal door, partition, and pilaster with a new type of fiber insulation, "BRIDGECORE".

Unlike ordinary corrugated board insulation (in which flutes run parallel to the outer surface metal sheets) BRIDGECORE has tubular cells which are at right angles to the metal. Thus each hexagonal cell forms a tubular truss from one metal to the other. There are over 6,000 such trusses in an average panel, cumulatively providing tremendous resistance to crushing, warp, and wind. As the illustration shows, the tubular form of the cells makes them so strong that BRIDGECORE easily supports the weight of a heavy man; in contrast, the foot of the same man can indent ordinary insulation material.

Also, each cell is flanged at the edge by a process developed by Sanymetal, and is sealed to the metal by bonding cement under pressure. This special flange both adds to structural strength, and assures an independent air cell, for maximum sound-deadening effect and resistance to moisture penetartion.

The structural principle applied is similar to that employed in modern 'honeycomb' aircraft wing construction which affords the greatest stiffness and strength/weight ratio.

. . . eliminates "LAMINATION SEPARATION"

OLD WAY: *With ordinary insulation, the longitudinal flutes are bonded either to the metal, or to a lining sheet which is in turn bonded to the metal. In either case, bond between the cells and the metal is limited to narrow lines or points, and it is a common experience that the bond fails, with a "lamination separation" in the core.*

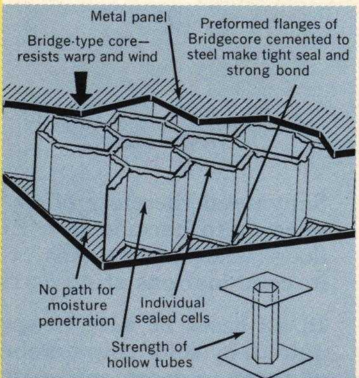
BRIDGECORE WAY: The BRIDGECORE method (see diagram at right) eliminates the liner sheet, and produces a positive, continuous bond sealing each cell to the metal. In Sanymetal's method of bonding, the surface bonded is increased by a factor of approximately 4 to assure utmost strength. This is accomplished by processing the BRIDGECORE so that *flanges* are preformed on the ends of each cell. These preformed flanges are cemented under pressure directly to the steel, producing an exclusive *compression bond.* This is what makes it a certainty that there is a tight, permanent, strong bond with BRIDGECORE.

Lightness of BRIDGECORE Cuts Costs

This advanced design principle provides an improvement in strength/weight ratio and decreases shipping weight, and lowers shipping and handling costs.

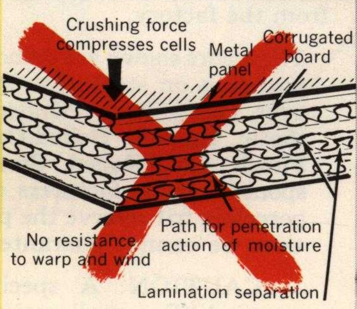
"BRIDGECORE WAY"

Cross-section of Sanymetal "BRIDGECORE" core insulation, showing the load-bearing tubular fiber cells which act as trusses to increase panel strength and stiffness.

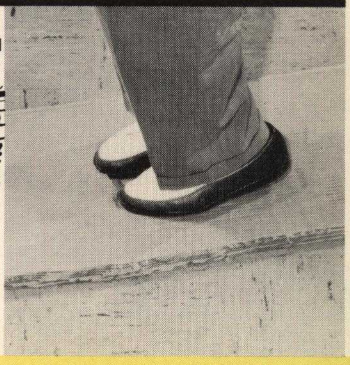


Metal panel
Bridge-type core—resists warp and wind
Preformed flanges of Bridgecore cemented to steel make tight seal and strong bond
No path for moisture penetration
Individual sealed cells
Strength of hollow tubes

Tubular cells of BRIDGECORE easily support weight of heavy man, because tubular form is strong; (below) same man stands on ordinary insulation, indents it.



Crushing force compresses cells
Metal panel
Corrugated board
No resistance to warp and wind
Path for penetration action of moisture
Lamination separation



MATERIALS AND FINISHES FOR HARDWARE AND TRIM

STAINLESS STEEL, because it is beautiful, and lasts, is used for pilaster shoes, head rails and locking strip moldings on Porcena compartments, and the bolt of all Sanymetal "8800" Latches.

HEAVY POLISHED CHROME PLATE of high quality which endures is used to finish exposed hinge surfaces, latch handles and escutcheons, latch keepers, coat hooks and bumpers, etc.

ZYTEL is employed for the opposing cams of the new Sanymetal "7950" hinge, because it offers the best combination of anti-friction properties, wear-resistance, and durability.

HIGH STRENGTH ALUMINUM ALLOY, extruded, heat-treated, polished and anodized, is used for stirrup brackets, as a means of making permanently beautiful, exceptionally strong.

NON-FERROUS CAST ALLOY, for chrome-plated hardware parts, to produce a non-rusting base that results in long serivce life.

Sanymetal® COLOR STYLING

MODERN TASTES DEMAND COLOR

Sanymetal therefore offers you 22 carefully chosen colors, selected to harmonize with standard colors used in walls, floors, and fixtures. Any order may use two of these colors in combinations at no extra charge.

In all cases be sure to specify the color combination required, by color chip number, from this page. Combinations of three or more colors can be furnished at special price from the factory.

The colors shown are standard for "Porcena" (vitreous porcelain on steel), for Synthetic Enamel Baked-On over Galvanized, Bonderized* Steel, and for Synthetic Enamel Baked-On over Regular Furniture Finish Cold-Rolled Steel. However, because responsible manufacturers of synthetic enamel and of porcelain frit reserve the privilege of reasonable variation, we cannot guarantee exact matching of colors.

(CAUTION: A specified color of Sanymetal "Porcena" varies noticeably from the same color in synthetic enamel, because the "Porcena" vitreous porcelain makes the color deeper and more brilliant.)

AIR-DRYING ENAMELS: Air-drying enamels, for maintenance and repairs, can be obtained from Sanymetal, or in quantity from DuPont Finishes Division Industrial Sales offices. These color names and specification numbers should be used to get the color match required.

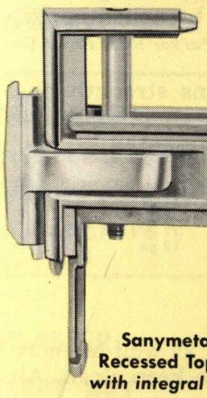
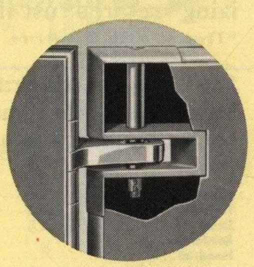
Sanymetal® HARDWARE

This hardware is *engineered* specifically for use on Sanymetal toilet and shower compartments. Unlike make-shift adaptations and quickly improvised imitations, Sanymetal Hardware is made to withstand the conditions of its use — the materials are corrosion-resistant, the finishes are heavy and lasting, and every item is strong enough to take normal use and considerable abuse.

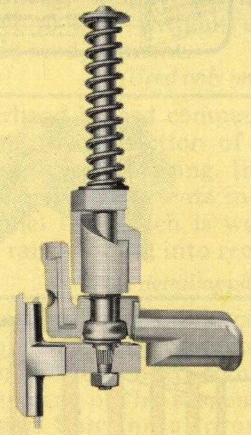
(SEE PATENT NOTICES, P. 6)



Sanymetal No.7950 Recessed Top Door Hinge *with integral hinge bracket*

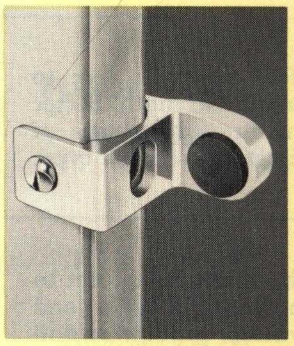


Three point support of top hinge pin provides more than ample strength to withstand extreme abuse, as from an adult swinging on door. Integral bracket (factory-applied to pilaster) eliminates bolting.

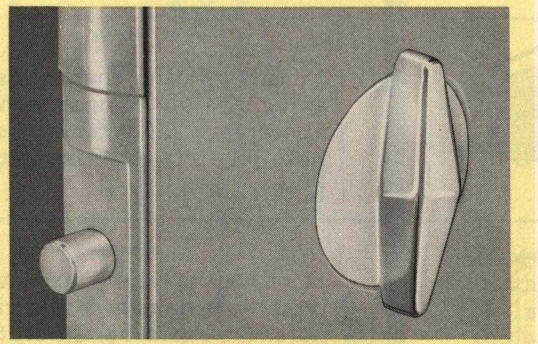


Sanymetal No. 7950 Concealed, Controlled Action Bottom Door Hinge *with integral hinge bracket*

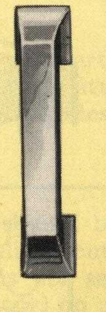
Fully adjustable for positioning door, and fully concealed within door panel, this hinge permits door to swing in one plane, without rising or lowering. Zytel cams give smoothest possible action.



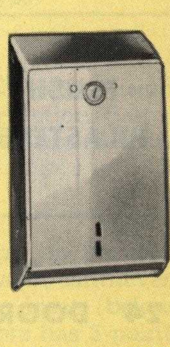
Sanymetal No. 8801 Combination Stop and Latch Keeper



Sanymetal No. 8800 Concealed Latch Working-parts fully concealed within door.



No. 7401 Door Pull



No. 331 Paper Holder, Cabinet Type

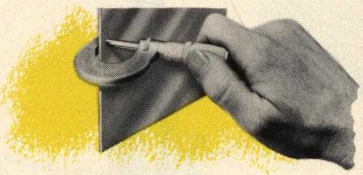
STEEL BASE

Sanymetal affixes a label to certify the use of properly galvanized, Bonderized* steel, finished with 2 coats of baked-on synthetic enamel. This insures good adherence of the enamel, and galvanizing and Bonderizing* retards rust if enamel is breached in use.

**Treated with Bonderite, a product of Parker Rust Proof Co.*

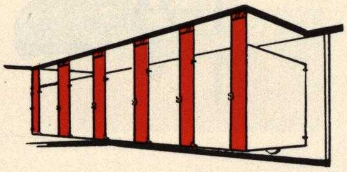
FULL GAUGE STEEL



Steel gauge (thickness) governs strength and durability. Sanymetal uses steel of these gauges for synthetic enamel finished compartments:

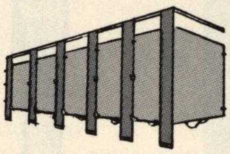
Part	Century and Normandie Types	Academy Type
Panels	20 ga.	20 ga.
Pilasters	16 ga:	20 ga.
Doors	22 ga.	22 ga.
Reinforcements	12 ga.	16 & 14 ga.
Headrail	......	20 ga.

FLUSH CONSTRUCTION



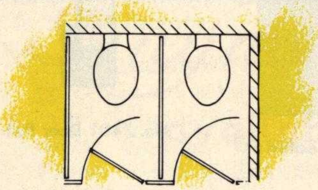
Flush construction is stronger, as well as more pleasing in appearance, and easier to keep clean. All Sanymetal types are entirely flush construction.

FLUSH PILASTERS



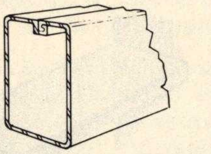
Pilasters, rather than posts, afford space for door to swing into the compartment. Greater strength, better appearance, and easier cleaning are advantages of flush pilasters. All Sanymetal pilasters are flush type.

24″ DOORS



Door widths (and pilaster widths) must be correct to permit inswinging doors, with no waste of space, and no strike against fixtures. Sanymetal provides a full range of standard door sizes, recommends 24″ width.

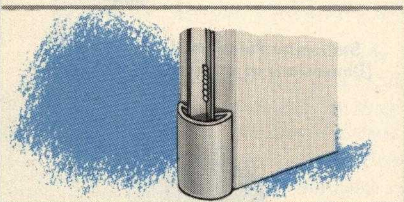
TUBULAR STEEL HEADRAIL



A tube offers the maximum rigidity and strength for a given weight of metal used in a structure. Sanymetal headrails are tubular, formed from 20 gauge steel, in continuous lengths with a lock seam, for high rigidity and strength.

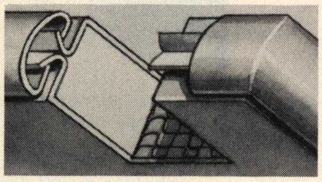
(Used only on Academy Type)

RAW EDGES CONCEALED



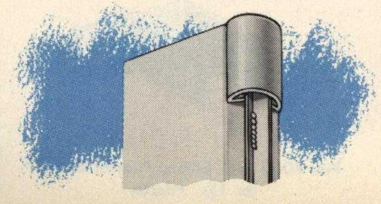
Exposed raw edges look shoddy, will provide a point for corrosion to start, and offer a sharp surface causing cuts or injuries. In Sanymetal construction all raw edges are turned under or covered.

LOCKING STRIPS on All Sides of Panels, Pilasters and Doors



Correctly designed locking strips give greater strength and better appearance than can be achieved with "snap-together" construction. Sanymetal oval crown locking strips on all sides of panels, doors, pilasters, provide a positive seal and reinforcement. No raw edges are left exposed.

WELDED DOORS AND PILASTERS



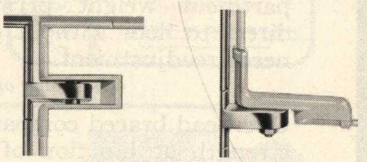
Face plates of doors and pilasters should be welded together, to create strong, rigid structural units. Sanymetal doors and pilasters are so welded, producing door and pilaster units that stay flat without wind, and in line even after severe abuse.

Check open specifications to be sure they cover these essentials. All these items are standard from Sanymetal® as well as available from other reputable manufacturers. By specifying the named items you set up a standard of durability, of value.

ESSENTIAL		WHY THIS FEATURE IS ESSENTIAL, AND HOW SANYMETAL PROVIDES IT
JACK-TYPE LEVELING SCREW		Built-in jackscrew saves field labor, provides permanent support to floor which cannot slip. Sanymetal jackscrew is adjustable with one hand, supports compartment weight permanently and mechanically direct to floor without depending on friction, never needs readjustment. *(Used only on Academy Type)*
HEADRAILS Reinforced and Positively Fastened to Pilasters		Overhead braced compartments should provide extra strength at junction of headrail to pilaster, to get strength from bracing. In Sanymetal construction the tubular rail (A) seats in a 14-gauge steel reinforcing channel (B) which is welded to pilaster face plates, and rail is locked into recess with metal screw (C). *(This detail applies to Academy Type)*
PLASTER INSERT KEY		On ceiling hung units, plaster around the suspension points should be protected against any bearing force from the suspended compartments, to prevent slight movement of the suspension bolts from cracking the plaster. Sanymetal provides this protection with a plaster insert key. *(This detail applies to Century Type)*
FLOOR PLATES Included	 LEVELING NUT LOCK NUT AND WASHER SPRING CLIP FINISHED FLOOR FLOOR ANCHOR PLATE DRY CONCRETE FILL	Floor-braced compartments must include provision for floor plates and fittings required in erection. Sanymetal always includes these items at no extra cost.
TOP HINGE PIVOT Anchored At Both Ends		Hinge pivot should be supported amply to prevent bending, misalignment, and excessive wear, cantilever pin support is not satisfactory. Hinge inset (below top edge of door) on all Sanymetal doors has 3-point support, strong to resist abuse. An adult can swing on a Sanymetal hinge without harming it.
STAINLESS STEEL PILASTER TRIM		Pilaster trim should be attractive, permanent. Sanymetal provides polished .031 gauge stainless steel trim, 3 inches deep, which keeps its attractive appearance despite cleaning materials, acids, scuffing. Trim is held by spring clips, not by exposed screws.
ONE-WAY SCREWS TO STOP PILFERAGE		Latches, keepers, coathooks, and paper holders may disappear if not protected by pilfer-proof screws. Sanymetal provides this important item to reduce maintenance cost.
PAPER HOLDERS		When paper holders are specified, shop drawing should show type and quantity for comparison. Sanymetal drawings do show this information.
DOOR HARDWARE		Door hardware, including minor items like keepers and coathooks, should be of good grade, with polished chrome plate which will retain a good appearance for the life of the installation. Sanymetal furnishes high grade chrome-plated hardware for this reason.

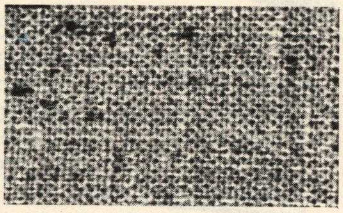
CHECKLIST OF Sanymetal® EXCLUSIVES...

***INTEGRAL HINGE BRACKETS**



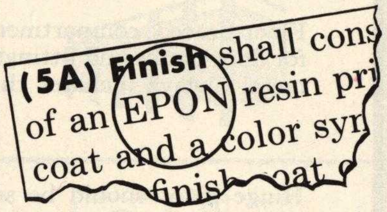
Because they are integral with pilaster, Sanymetal's Integral Hinge Brackets save installation time, and make certain that every door hangs right without adjustment.

VINYL COATED STEEL



Offers completely new decorative possibilities. Sanymetal has worked with and tested this material; this experience assures you of satisfactory results.

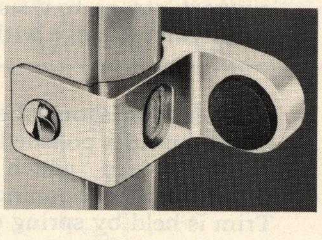
EPON PRIMER for Baked Synthetic Enamel Finishes



(5A) Finish shall cons
of an EPON resin pri
coat and a color syn
finish coat

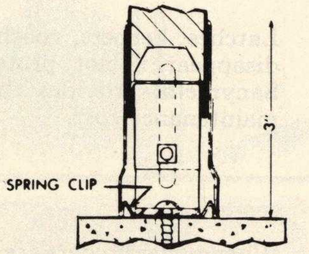
EPON resin primer is unique in its ability to increase the service life of baked enamel finishes. All Sanymetal specifications name this premium material.

***ONE-BOLT DOOR STOP AND KEEPER WITH ¾″ BUMPER**



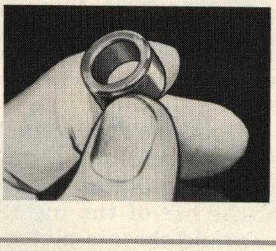
Modern design of Sanymetal door stop and keeper adds attractiveness, and also saves on installation time and cost, because it requires only one theft-proof bolt.
The heavy ¾″ rubber door stop bumper, locked in place on the combination stop keeper, absorbs all noise and shock of door closing.

***POSITIVE SNAP-DOWN PILASTER SHOE ASSEMBLY**



By use of a snap-down design to hold the pilaster shoe in place, Sanymetal eliminates an unsightly set screw, speeds installation, and makes certain that the shoe will be held correctly in place, under tension, so it always looks right.

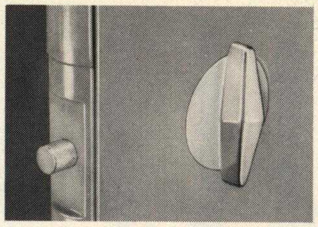
***FULLY BEARINGIZED PERMANENTLY LUBRICATED**



Every moving part of the Sanymetal Compartment, including upper and lower hinges and latch, is permanently lubricated and properly bearingized. There is no need for oiling, greasing, or other mechanical attention for the life of the compartment.

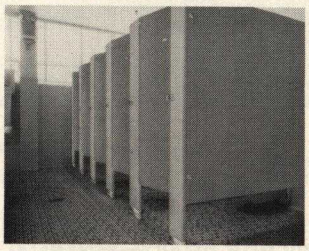
All the features shown on these two pages are furnished *only* by Sanymetal, and those marked with a star are on all types of Sanymetal Compartments. The latter are written right into Sanymetal specifications, and are not just "showcase" items furnished with one or two deluxe models. These features, developed or adopted by Sanymetal to provide necessary quality, put Sanymetal Compartments in a class by themselves.

*SANYMETAL "8800" FLUSH LATCH



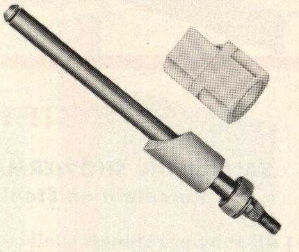
This is the only modern latch available on toilet compartment doors. Eliminates unsightly slide-bolt and throw-bolt assemblies which catch dirt and pinch fingers.

*FLUSH PILASTER SURFACES



Quicker cleaning, lower maintenance cost, and much, much better appearance are benefits of keeping pilaster surfaces completely smooth, without interruption, bolts, screws, or hinge brackets.

*ZYTEL-CAMMED HINGE DESIGNED FOR ONE-LEVEL SWING



The Sanymetal "7950" Hinge is unlike any other in that it gives you both the mechanical advantage of Zytel cams, and the architectural advantage of having the door remain on one level when opened and closed, preserving the uniform architectural lines of the installation.

*HINGES TESTED TO MORE THAN 1,000,000 SWINGS *by an independent laboratory*

Re: Operating Endurance Tests

On Lavatory Door Installation
Using 7590 Series Concealed Hinge
and
5800 Series Concealed Brackets

Gentlemen:

In accordance with your instructions, we selected a concealed hinge of the 7590 series at random from your stock. This operating mechanism for the lavatory compartment door, in conjunction with two 5800 series concealed hinge brackets, was subjected to the operating endurance test described below:

After completion of the test, the door and stile were dismantled and examined. We found that the 5800 series concealed brackets were still rigidly mounted in the stile and in good condition. The 7590 series concealed hinge was also dismantled and all working parts (including the Zytel cams) were found to be in good condition and showed little evidence of wear.

HERRON TESTING LABORATORIES, INC.

I, the undersigned, swear and affirm that the above test and results are true and correct to the best of my belief.

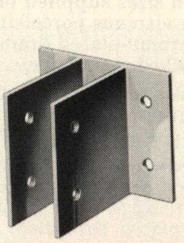
L. S. Johnson
L. S. Johnson

Sworn and subscribed to before me this 24th day of July, 1959.

Eleanor M. Cowell
Eleanor M. Cowell, Notary Public
My Commission Expires August 7, 1959

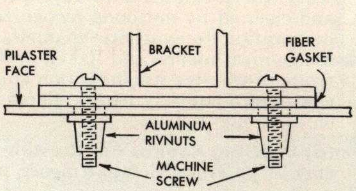
Sanymetal hinges are fully tested, *by using a complete door hung in the normal manner, in an independent testing laboratory.* You can rely on the results as indicative of objective, engineering facts.

PORCELAIN PROPERLY HANDLED



Sanymetal follows procedures and provides hardware suitable for maximum results from porcelain enamel. No holes or breaks are made in the enamel surface, at the factory. Sanymetal hardware has the extra strength required for satisfactory assembly and mounting of porcelain compartments.

*RIVNUTS, WITH FIBER GASKET ON PORCELAIN



To connect porcelain-finished pilasters to side partitions Sanymetal uses aluminum rivnuts with a fiber gasket. Rivnuts with machine screws engage 3 times as many threads as tapped plates, produce a stronger support, and also prevent chipping. The gasket cushions against cracking. Corrosion-resistant aluminum affords durability appropriate for porcelain installations.

CONSTRUCTION DETAILS—SANYMETAL SHOWERMASTER CABINET

PLAN DETAIL ST88, PAGE 31

Improved SHOWERMASTER

SHOWER CABINET

New design of the Showermaster makes these cabinets more handsome, much easier to install, and more practical for installation in close quarters and in batteries. Assembly is by a "push-button" locking device which permits easy handling of the job – just put the back wall in place, bring each of the two sides into position, depress the "push-button" on each side, and the major part of the installation is completed. The improved Showermaster can be installed *easily* in alcoves with as little as ¼" clearance on each side, and in multiple installations cabinets can be butted together.

With the new design the only seams are at the two rear corners, and these are drawn very tight by the "push-button" locking mechanism, so calking is easy and neat.

Available in Two Materials:

(1) Sanymetal "Porcena" (Vitreous Porcelain on Steel).

(2) Sanymetal Synthetic Enamel Baked-on over Galvanized, Bonderized* Steel.

All Showermasters furnished with Porcena vitreous porcelain-enamel-on-steel receptors. For colors see page 20 (one color only; 2-color combinations not available.)

Sanymetal Showermaster Cabinets feature 3-ply construction, consisting of two sheets of metal compressed to BRIDGECORE. (Walls of ordinary cabinets are made of a single sheet of steel, which, when struck, give off characteristic "sheet music.") A Showermaster is built to remain serviceable, sanitary, and attractive long after cabinets of single sheet construction have deteriorated.

The Showermaster assembly include 3 walls and entrance (flush type, fully insulated) and receptor of porcelain enamel with integral drain. Special finish of the porcelain enamel gives it a non-slip surface.

Showermasters are shipped disassembled. For multiple units, filler plates are available to allow any desired spacing.

Glass doors (furnished by others) are the appropriate closure for cabinets of this quality. Chrome-plated curtain rods are furnished.

Standard sizes: 32" x 32" x 82"; 36" x 36" x 82"

SPECIFICATIONS

SANYMETAL SHOWERMASTER "Porcena" (Vitreous Porcelain on Steel) SHOWER CABINETS

(1) All shower cabinets shall be Showermaster Flush Type as manufactured by The Sanymetal Products Co., Inc., Cleveland, Ohio.

(2) Walls: Walls to be 76" high by 1" thick, made of two sheets of 18 gauge porcelain sheet steel, assembled over and cemented under pressure to a dense, sound-deadening core insulation. Walls to be vitreous porcelain enameled on all surfaces, with color coats of vitreous porcelain on visible exterior surfaces only.

Alternate material: If synthetic enamel is desired, use the following: Walls to be 76" high by 1" thick, made of two sheets of 20 gage galvanized, Bonderized* steel cemented to a dense, sound-deadening core insulation.

(3) Receptors: Receptors shall be 32" by 32" (or 36" by 36") (other standard sizes supplied on special order) made of black and white Porcena vitreous porcelain enamel, with which shall be furnished a brass chrome-plated drain, with removable strainer, to receive a 2" inside calked waste pipe.

(If precast terrazzo receptor is required, specify ". . . made of black and white precast terrazzo material in which shall be cast a brass chrome-plated drain . . ." etc.)

(4) Hardware: (Specify walls to be drilled for valves and shower head.) Valves, shower head, soap dish, shower door or curtain, and similar fittings to be supplied by others. Curtain rod, 1/2" round, chrome-plated, furnished.

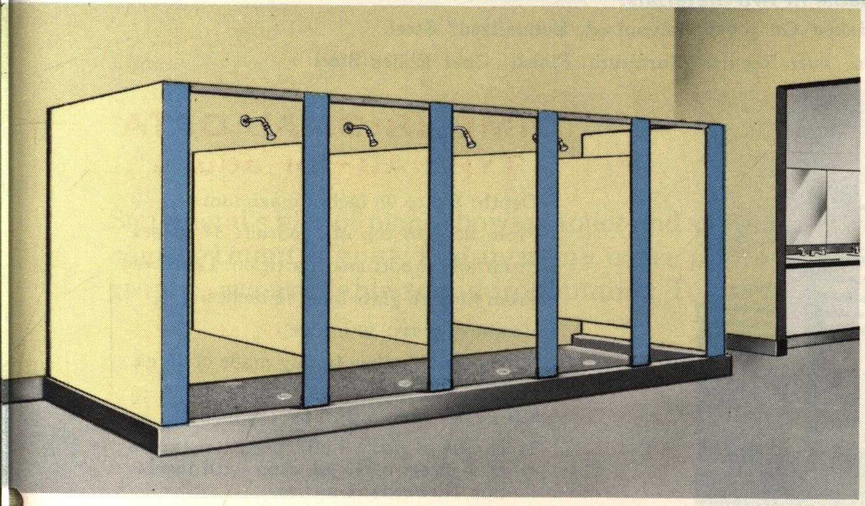
(5) Finish: Sanymetal "Porcena" (vitreous porcelain on steel) as described on page 18.

(If synthetic enamel is desired, specify: All metal surfaces to be sanded and cleaned by methods recognized as good commercial practice in preparation for synthetic enamels, which are to be applied by modern mechanical means and baked-on to provide a uniform, smooth, lustrous protective finish, which shall consist of an Epon resin prime coat and a color synthetic finish coat of high-temperature baked-on enamel.)

(6) Dressing Rooms: For dressing rooms use specifications for Academy Type Toilet Compartments, page 14.

IMPORTANT: Sanymetal Showermasters can be built into multiple-unit installations with dressing rooms. See Layout ST88, page 31.

SHOWER STALLS AND DRESSING ROOM COMPARTMENTS



ACADEMY TYPE *Shower Stalls as installed in employee shower room of a large steel company.*

ACADEMY TYPE

Academy Type Shower Stalls are available in Sanymetal "Porcena" or Sanymetal Synthetic Enamel Baked-On over Galvanized, Bonderized* Steel. (Shower basin with curb to be constructed by others.) Consult your Sanymetal Representative or write to factory for details showing how end panels are fitted to curb of shower basin. Overhead bracing serves as curtain rods. Curtains furnished at extra cost.

SPECIFICATIONS . . . Page 14

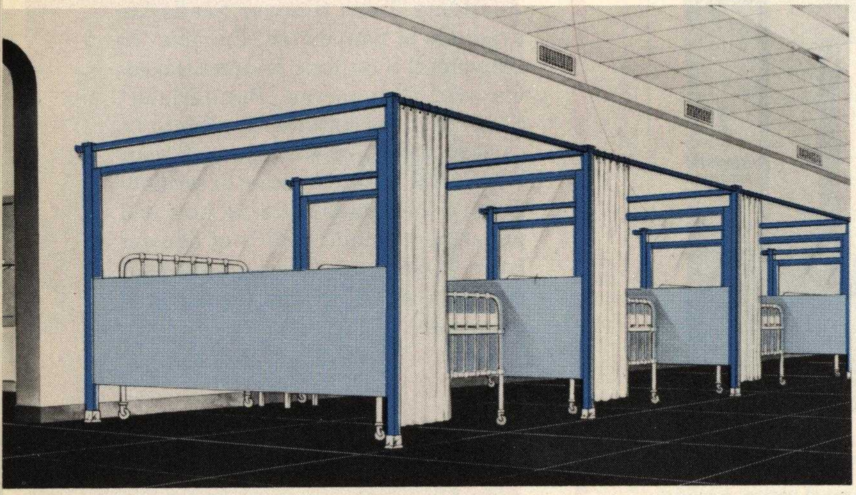
Sanymetal® FLUSH TYPE HOSPITAL CUBICLES

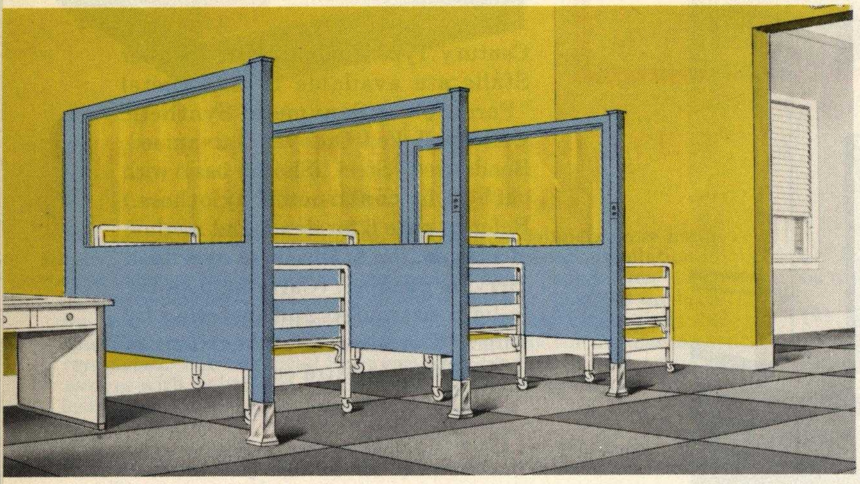
Available in two materials:

Synthetic Enamel Baked-On over Galvanized, Bonderized* Steel.

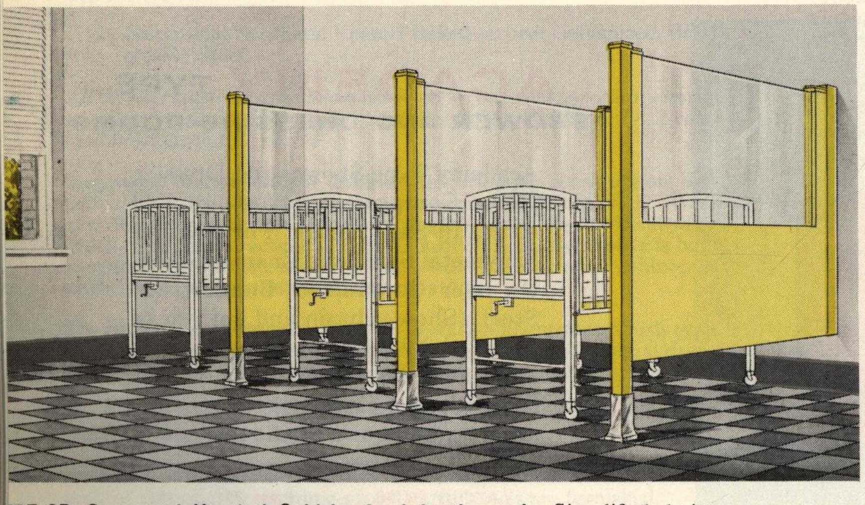
Synthetic Enamel Baked-On over Regular Furniture Finish Cold Rolled Steel.



PE AD: Sanymetal Hospital Cubicles for adult wards *consist of three units: Two flush type nd-deadened steel and glass partitions with headrail assembly—a strong sound construction oughout. Hollow posts provide means for enclosing wiring and oxygen pipes with outlets. rtains furnished at additional cost. Construction details available on request.*



PE ADS: Sanymetal Hospital Cubicles for children's wards. *Simplified design creates ward en- nment in harmony with modern interior treatments, providing adequate privacy for patients ile maintaining the effect of open area spaciousness. Hollow posts provide means for enclos- wire and oxygen pipes with outlets. Construction details available on request.*



PE CD: Sanymetal Hospital Cubicles for infant's wards. *Simplified design preserves open a spaciousness throughout ward area yet provides adequate privacy. Construction details ailable on request.*

DIMENSIONAL DATA
TYPE AD–for adults

Depth: Up to 96 inches maximum.

From floor to top of headrail: 84 inches.

From floor to bottom of partition: 12 inches.

From floor to glass line: 42 inches.

Height of glass: 30 inches.

Size of post (hollow tubing made of 16 ga. steel): 2 inches by 2 inches.

Size of headrail: 1 inch by 1½ inches.

Thickness of flush metal partition (made of 2 sheets of 20 ga. steel with insulation between): 2 inches.

Height of chrome-plated brass shoes: 1½ inches.

Type ADS–for children

Depth: Up to 60 inches maximum.

From floor to top of partition: 72 inches.

From floor to bottom of partition: 12 inches.

From floor to glass line: 42 inches.

Height of glass: 30 inches.

Size of post (hollow tubing made of 16 ga. steel): 2 inches by 2 inches.

Size of headrail: 1 inch by 1½ inches.

Thickness of flush metal partition (made of 2 sheets of 20 ga. steel with insulation between): 2 inches.

Height of chrome-plated brass shoes: 6 inches.

Type CD–for infants

Depth: Up to 54 inches maximum.

From floor to top of glass area in partition: 72 inches.

From floor to bottom of partition: 12 inches.

From floor to glass line: 42 inches.

Height of glass: 30 inches.

Size of post (hollow tubing made of 16 ga. steel): 2 inches by 2 inches.

Size of headrail: 1 inch by 1½ inches.

Thickness of flush metal partition (made of 20 ga. steel with insulation between): 2 inches.

Height of chrome-plated brass shoes: 6 inches.

For greater detail of construction, consult ***The Sanymetal Products Co., Inc.***

For colors see page 20.

AIDS TO ARCHITECTS, OWNERS, BUILDERS AND CONTRACTORS

PLANNING

Sanymetal's files of plans showing toilet and shower compartment layout, and in many cases photographs, are available to aid in planning. To draw on these files, consult your Sanymetal Representative, or describe your problem in detail in a letter directed to Sanymetal's Engineering Department.

STOCKS

Stocks of Sanymetal Toilet Compartment components are maintained in numerous locations (see page 32). These stocks make it possible to solve many problems involving quick delivery. (Note, however, that choice of types and colors from stock is necessarily limited.)

SEE-FOR-YOURSELF TOURS

If an important installation is being planned, you will be well advised to check *how Sanymetal installations made for others* meet your requirements for beauty and durability. Your Sanymetal Representative will arrange to take you to visit both new and old Sanymetal installations in your vicinity – you can see for yourself the quality features provided. Or, write for the list of thousands of Sanymetal Porcena installations, and check those which are nearby.

PART AND FINISH AVAILABILITY

Metal toilet compartments have been the principal business of Sanymetal for 45 years, and will continue to be. This means that Sanymetal Compartments will not become "orphan" brands – there is a reliable, continuing source of engineered parts. Note in particular the availability of correct air-drying enamels for maintenance of Baked Enamel Finishes. (See page 20).

REPRESENTATIVES EASY TO REACH

There are Sanymetal Representatives in more than 130 cities in the continental United States. This assures fast, convenient service near the site of any installation.

Sanymetal® TOILET AND SHOWER

Various toilet and shower compartment layouts are here illustrated to assist architects and engineers.

Sanymetal has a wide variety of other layouts on file. You may draw on these files by consulting your local Sanymetal Representative, or by describing your problem in detail by letter direct to Sanymetal's Engineering Department.

STANDARD SIZES OF COMPARTMENTS:

Width: 32, 34 and 36 inches; center to center of compartment
Depth: 57 inches
Heights of Partitions: 57½ inches; Doors: 58 inches
Distance from floor to bottom of Partitions: 12½ inches
Distance from floor to bottom of Door: 12 inches
Distance from floor to top of Partitions: 70 inches; to top of Doors: 70 inches
Distance from top of Doors to top of Headrail: 12 inches
Overall heights measured from top of floor to top of Headrail: 82 inches

STANDARD WIDTHS OF PILASTERS:

2, 3, 4, 5, 6, 7, 8, 9, 10, 12 and 14 inches

STANDARD WIDTHS OF DOORS:

For Door openings: 22, 24, 26, 28, 30, 31, 33 inches wide

The foregoing dimensions comply with the modular system of dimensional coordination and are standard stock sizes for Partitions, Doors and Pilasters.

STANDARD SIZES FOR PARTITIONS, PILASTERS, AND DOORS:

You gain worth-while advantages by specifying standard size compartments wherever possible. Standard sizes permit you to use standard layouts. You also benefit from the fact that standard sizes are more quickly and economically fabricated, delivered, and installed.*

**Compartments also available in sizes larger or smaller than sizes shown.*

OUTSWINGING DOOR REQUIRES ADDITIONAL CLEARANCE SPACE

PLAN

Layout SM88

Advantages of Inswinging Doors Over Outswinging Doors

Sanymetal furnishes both inswinging and outswinging doors, but recommends use of inswinging doors.

For safety, corridors and aisles should be unobstructed at all times. Inswinging doors permit unobstructed passage space.

Inswinging doors require deeper compartments, but outswinging doors do not reduce essential compartment depth sufficiently to overcome the disadvantages they entail. Actually, the space required for the outswing of a door plus extra aisle clearance for persons to avert possible injury, requires more floor space than is necessary for an installation with doors which swing in.

Inswinging doors should be installed to stand open, thus indicating whether compartment is in use. Cleaning is more thorough when doors stand open, because cleaner can use both hands on the mop, not one on the door, one on the mop. So installed, inswinging doors are always latched when closed, thereby preventing danger of injury to individuals.

Layout SB88

Back-To-Wall Toilets With Vent

Back-to-wall toilets with vent provide a vent or utility space of the same height as the dividing Partition panels. This utility space is between the rear of the compartment and the wall of the room. Utility space is usually covered at top and equipped with Door. Compartments have removable metal backs as illustrated in Isometric View Z88. Utility compartment and removable metal backs are set on concrete curb to be constructed by others. Removable metal backs provide freer access to concealed plumbing.

84 years designing and manufacturing

WEIS

originated
the
metal
toilet
compartment

Because of the many variable and uncontrollable factors that affect the baking or firing process, and because responsible manufacturers of baking enamel and porcelain frit retain the privilege of a reasonable color variation, we are consequently unable to guarantee the exact matching of colors.

Any two colors may be selected on Vitre-Steel orders. Additional colors slight extra charge.

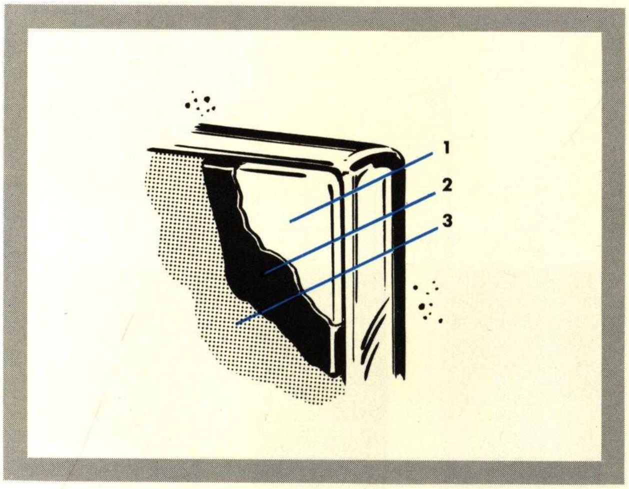
WEIS FINISHES



VITRE-STEEL

porcelain enamel

1. ***Enameling iron***
2. ***Ground coat (porcelain enamel)***
3. ***Cover coat (porcelain enamel)***

Vitre-Steel finish may be specified for Ceiling Hung, Floor Braced and Hi-Stile compartments. The enameling iron is completely sealed with porcelain enamel, fired (not baked) inside and outside the double-wall partitions, stiles and doors. Surfaces are then refired in your choice of Vitre-Steel colors. Glass-hard Vitre-Steel finishes withstand not only normal every day usages, but the attacks of acids, cleaning compounds and resist defacement.

BAKED ENAMEL

on bonderized galvanized steel

Years of lasting beauty . . . that's the service promise assured by the Weis label:

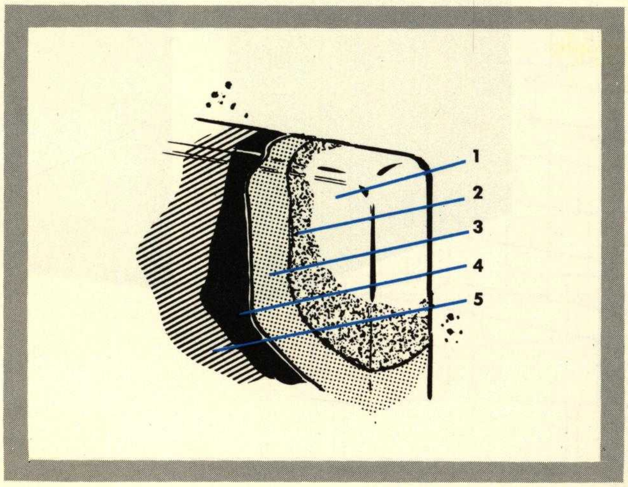
1. Cold rolled steel.

2. Galvanized, surface smoothness equivalent to furniture steel, affords resistance to corrosion.

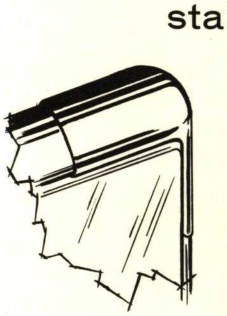
3. Bonderized, additional corrosion resistance and positive adhesion of enamel to metal.

4. Synthetic primer.

5. Enamel—combines highly protective surface coating with lustrous beauty in a wide range of colors.

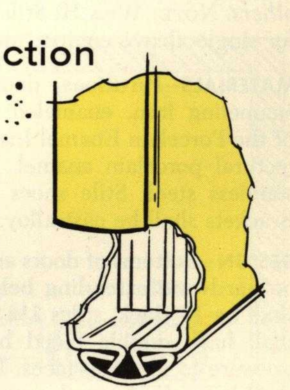


stainless steel corners



The new Weis stainless steel corner reinforcement is applied on all partitions and doors and does not disturb the bonderizing or galvanizing. Furthermore, the corners are completely covered by type 302 stainless steel. Corners finished by conventional welding and grinding lose their galvanized and bonderized coating.

flush type construction

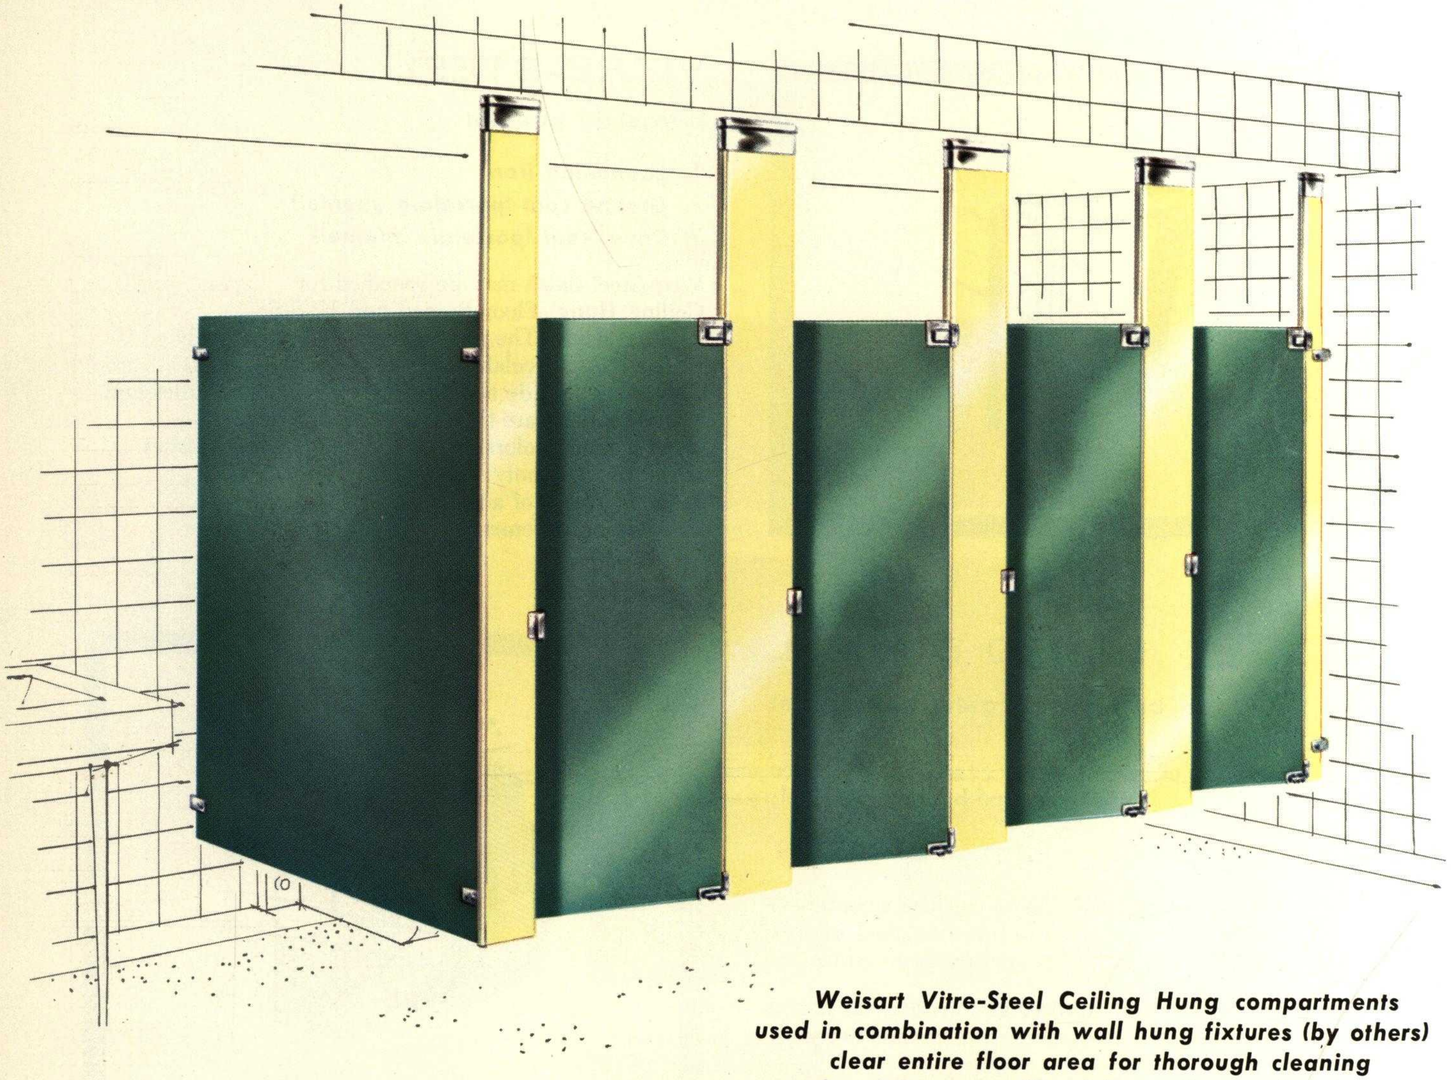


Flush partitions, stiles, and doors are made of two sheets spaced and insulated with double faced honeycomb cores cemented to inner surfaces under pressure. Each partition, stile, and door is welded into a rigid one piece unit, then bound with interlocking molding reinforced at corners with stainless steel.

All specifications subject to change without notice.

WEISART

VITRE-STEEL *(Porcelain Enamel)* CEILING HUNG COMPARTMENTS



Weisart Vitre-Steel Ceiling Hung compartments used in combination with wall hung fixtures (by others) clear entire floor area for thorough cleaning and maintenance with minimum time and cost. Completed installation, in accordance with specifications, provides trouble-free service for the life of the building

SPECIFICATIONS

GENERAL—Toilet compartments shall be Weisart Vitre-Steel, Ceiling Hung, as manufactured by Henry Weis Manufacturing Company, Inc., Elkhart, Indiana. Partitions, stiles, and doors shall be flush construction. *Structural members in ceilings by others.* NOTE: Weis Hi-Stile (overhead braced) recommended for single alcove compartments.

MATERIALS—Partitions, doors and stiles shall be 18 gauge enameling iron, enameled in accordance with specifications of the Porcelain Enamel Institute, Inc., for acid resisting architectural porcelain enamel. Edge molding shall be 20 gauge stainless steel. Stile shoes shall be stainless steel, 3″ high. Brackets shall be cast alloy.

DESIGN—Bottoms of doors and stiles shall be in alignment, with no hardware extending below bottom line. Panels and doors shall be 1″ thick, stiles 1¼″ thick. Partitions, doors and stiles shall have double faced honeycomb cores cemented under pressure to inner surfaces. Face plates of doors and partitions shall have die formed corners and edges, the latter with flat, level, die formed welding segments, and shall be fused together at these segments to form a rigid one piece unit. Face plates of stiles shall have formed edges, welded together into a rigid unit. All edges shall be bound with interlocking trim molding. Stile molding shall be mitered and welded at corners. Partition and door molding shall be reinforced with die formed stainless steel corners. Wall and floor fastenings shall be adjustable.

FINISH—All surfaces, concealed and exposed, shall receive a vitreous porcelain enamel ground coat. All exposed surfaces shall receive a cover coat in color selected from the Weis color chart. (Combinations of three or more colors, slight extra charge.) Castings shall be chromium plated.

HARDWARE—Doors shall be hung on Weistyle concealed gravity hinges, with stainless steel pintles and actuated by opposed nylon cams in the lower hinge. Hinges shall be recessed in edge of door. Compartments with doors shall be fitted with combination keeper and bumper, slide bar latch and coat hook with rubber tipped bumper. Latches and coat hooks applied with theft resistant, one way screws. All hardware non-ferrous metal, chromium plated.

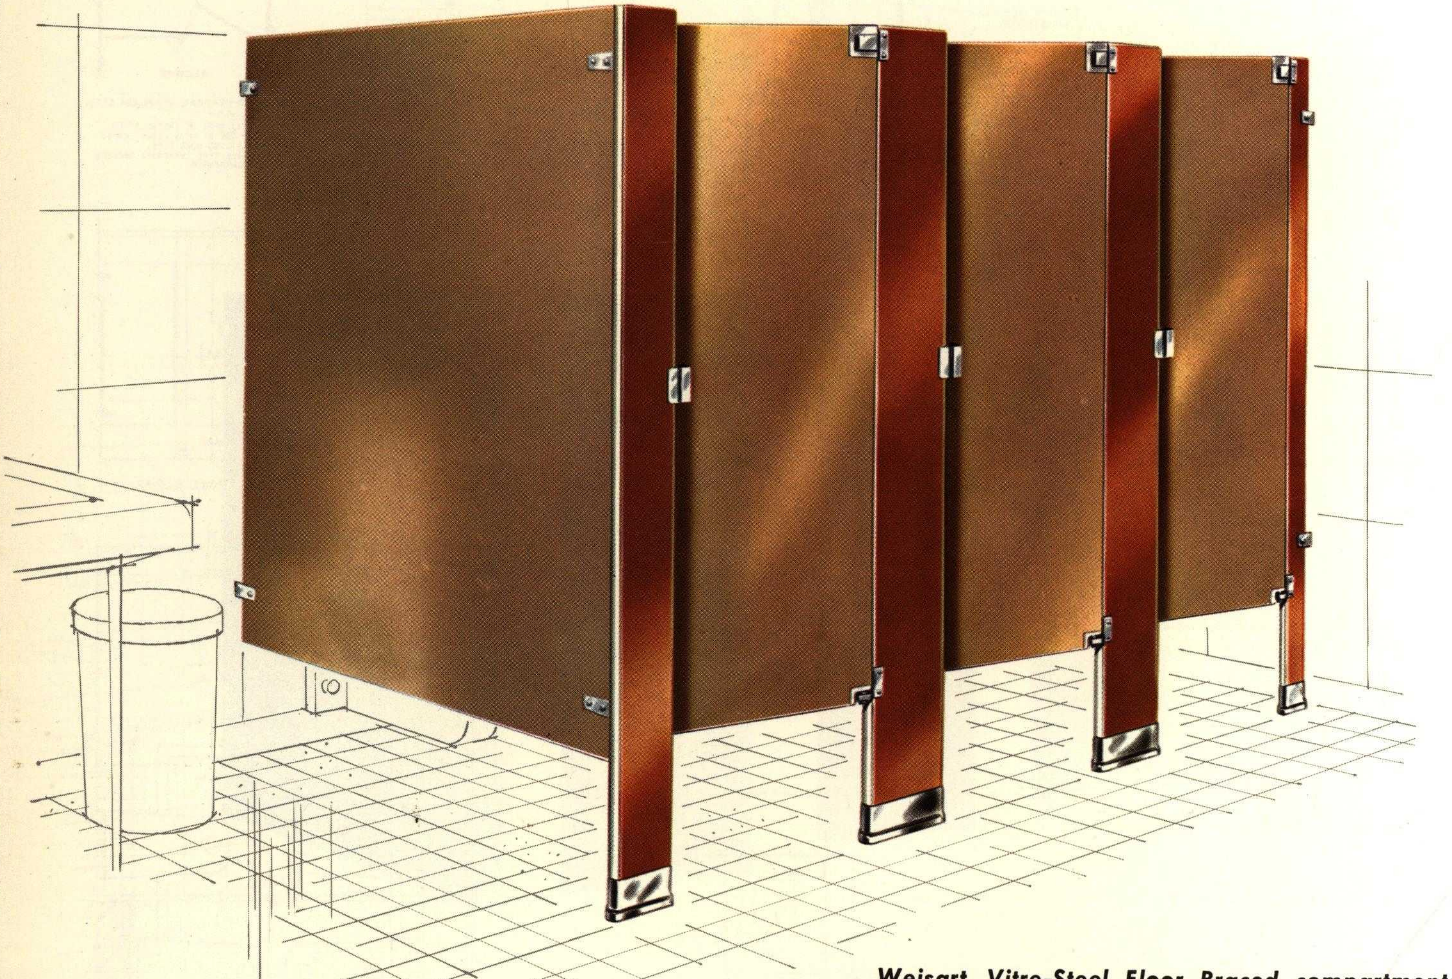
WEISART

VITRE-STEEL *(Porcelain Enamel)* FLOOR BRACED COMPARTMENTS



Weisart Vitre-Steel Floor Braced compartments offer clean, horizontal lines created by rigid flush stile construction that entirely eliminates overhead bracing. The Weis upper inset hinge permits doors and stiles to line up at top.

SPECIFICATIONS

GENERAL—Toilet compartments shall be Weisart Vitre-Steel, Floor Braced, as manufactured by the Henry Weis Manufacturing Company, Inc., Elkhart, Indiana. Partitions, doors and stiles shall be flush construction. *Solid sub-floor not more than 2″ below finish floor by others.* NOTE: *Weis Hi-Stile (overhead braced) recommended for single alcove compartments.* When specified sub-floor stile anchor assemblies shall be provided by Weis for installation by contractor before finished floor is laid. See detail opposite page.

MATERIAL—Partitions, doors and stiles shall be 18 gauge enameling iron, enameled in accordance with specifications of the Porcelain Enamel Institute, Inc., for acid resisting architectural porcelain enamel. Edge molding shall be 20 gauge stainless steel. Stile shoes shall be stainless steel, 3″ high. Brackets shall be cast alloy.

DESIGN—Doors shall be in alignment with tops of stiles, with no hardware extending above top line. Panels and doors shall be 1″ thick, stiles 1¼″ thick. Partitions, doors and stiles shall have double faced honeycomb cores cemented under pressure to inner surfaces. Face plates of doors and partitions shall have die formed corners and edges, the latter with flat, level, die formed welding segments, and shall be fused together at these segments to form a rigid one piece unit. Face plates of stiles shall have formed edges, welded together into a rigid unit. All edges shall be bound with interlocking trim molding. Stile molding shall be mitered and welded at corners. Partition and door molding shall be reinforced with die formed stainless steel corners. Wall and floor fastenings shall be adjustable.

FINISH—All surfaces, concealed and exposed, shall receive a vitreous porcelain enamel ground coat. All exposed surfaces shall receive a cover coat in color selected from the Weis color chart. (Combinations of three or more colors, slight extra charge.) Castings shall be chromium plated.

HARDWARE—Doors shall be hung on Weistyle concealed gravity hinges with stainless steel pintles, and actuated by opposed nylon cams in the lower hinge. Hinges recessed in edge of door. Compartments with doors shall be fitted with combination keeper and bumper, slide bar latch and coat hook with rubber tipped bumper. Latches and coat hooks applied with theft resistant, one way screws. All hardware non-ferrous metal chromium plated.

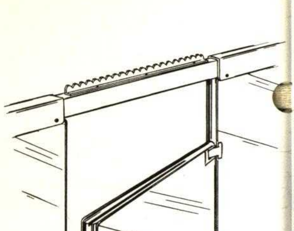
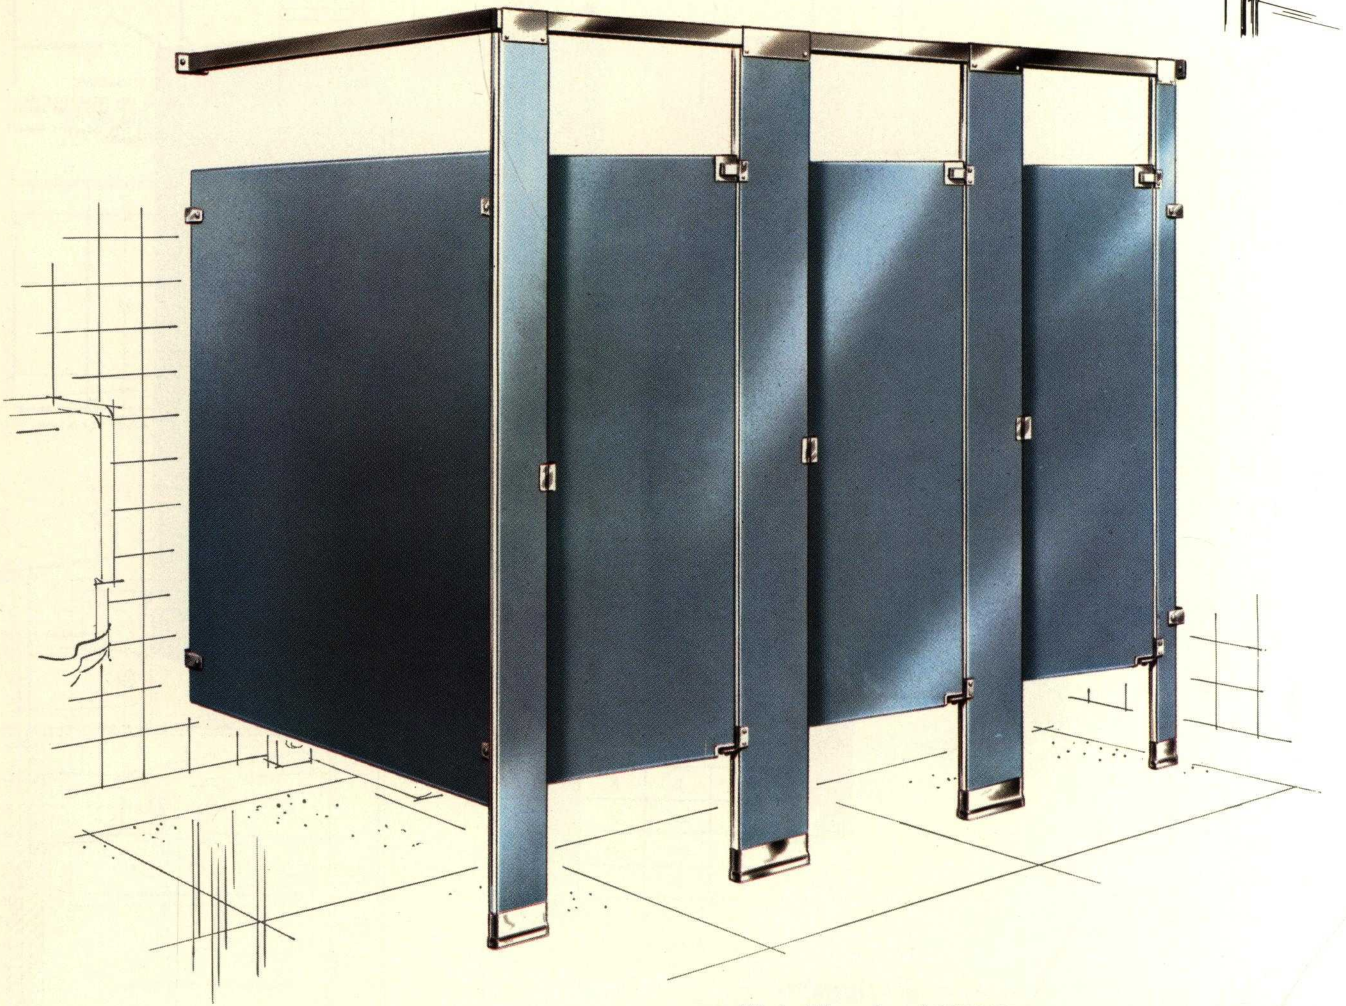
WEIS

VITRE-STEEL *(Porcelain Enamel)* HI-STILE COMPARTMENTS





Weis Vitre-Steel Hi-Stile compartments (overhead braced) combine attractive design with double assurance of a rigid installation. Weis "Loafer Rail" (illustrated) available when specified to discourage young "trapeze performers."

SPECIFICATIONS

GENERAL—Toilet, Shower and Dressing compartments shall be Weis Vitre-Steel, Hi-Stile, as manufactured by the Henry Weis Manufacturing Company, Inc., Elkhart, Indiana.

MATERIALS—Partitions, doors and stiles 3″ and wider shall be 18 gauge enameling iron, enameled in accordance with specifications of the Porcelain Enamel Institute, Inc., for acid resisting architectural porcelain enamel. Edge molding shall be 20 gauge, stainless steel. Compartments with full width doors and alcove compartments shall be furnished with stainless steel posts 1¼″ x 1⅞″ instead of vitreous porcelain stiles. Headrail shall be 1¼″ x 1⅞″ 20 gauge, stainless steel tubing. Stile shoes shall be stainless steel, 3″ high, except shoes for stiles under 4″ shall be cast alloy. Brackets shall be cast alloy.

DESIGN—Panels and doors shall be 1″ thick, stiles 1¼″ thick. Partitions, doors and stiles shall have double faced honeycomb cores cemented under pressure to inner surfaces. Face plates of doors and partitions shall have die formed corners and edges, the latter with flat, level, die formed welding segments, and shall be fused together at these segments to form a rigid one piece unit. Face plates of stiles shall have formed edges, welded together into a rigid unit. All edges shall be bound with interlocking trim molding. Stile molding shall be mitered and welded at corners. Partition and door molding shall be reinforced with die formed stainless steel corners. Wall and floor fastenings shall be adjustable.

FINISH—All surfaces, concealed and exposed, shall receive a vitreous porcelain enamel ground coat. All exposed surfaces shall receive a cover coat in color selected from the Weis color chart. (Combinations of three or more colors, slight extra charge.) Castings shall be chromium plated. All stainless steel components polished finish.

HARDWARE—Doors shall be hung on Weistyle concealed gravity hinges with stainless steel pintles, and actuated by opposed nylon cams in the lower hinge. Hinges recessed in edge of door. Compartments with doors shall be fitted with combination keeper and bumper, slide bar latch and coat hook with rubber tipped bumper. Latches and coat hooks applied with theft resistant, one way screws. All hardware non-ferrous metal chromium plated.

WEISART

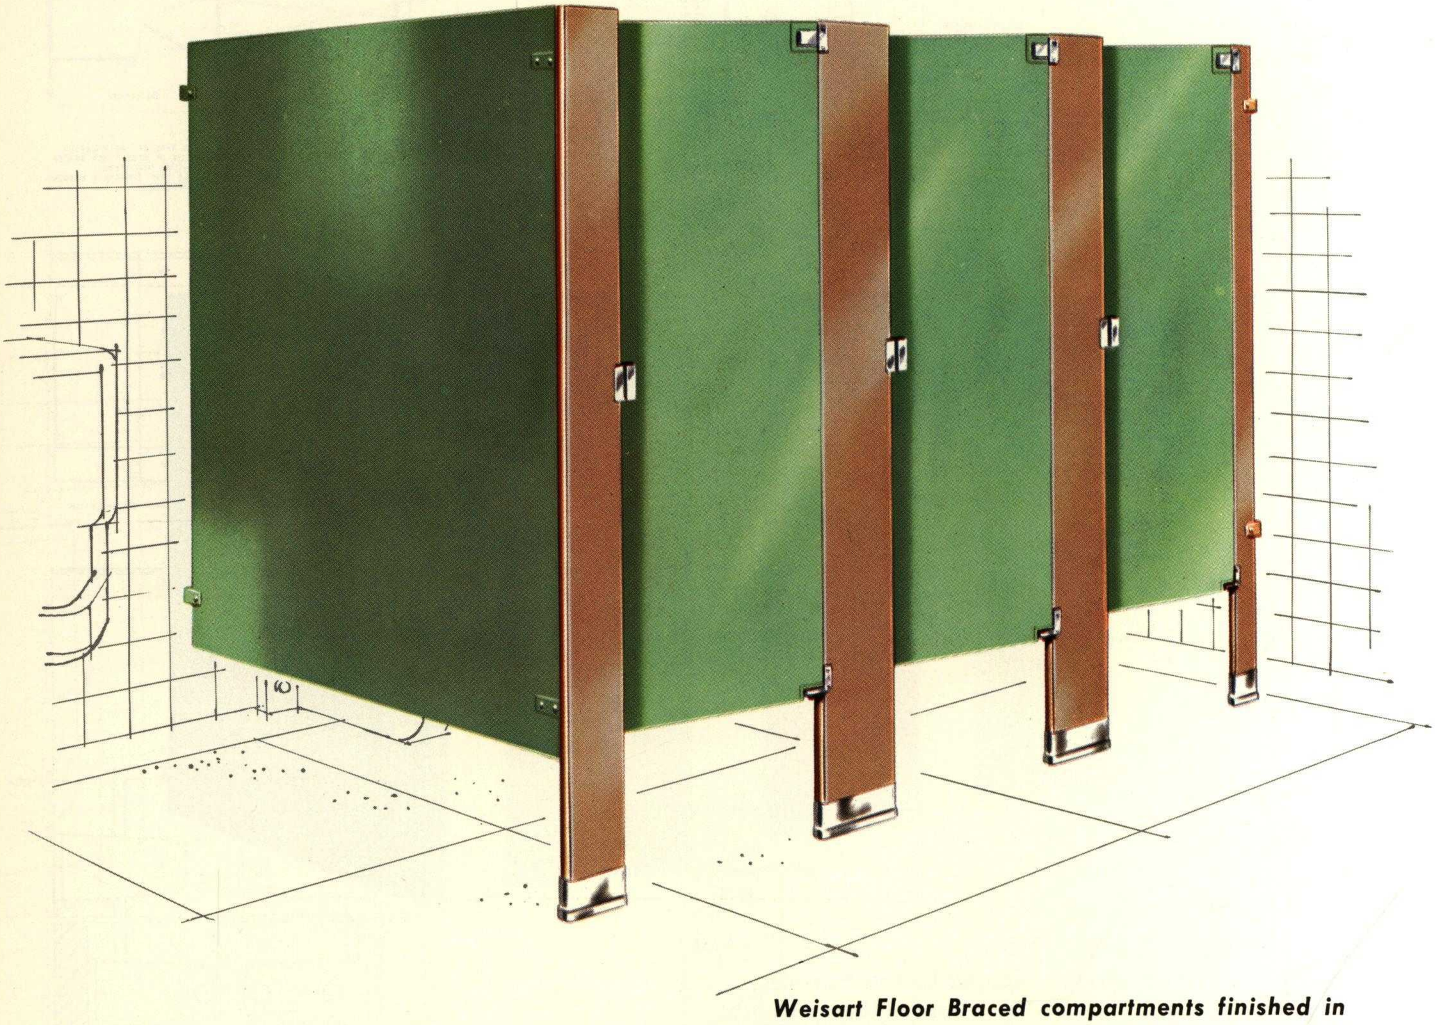
BAKED ENAMEL FLOOR BRACED COMPARTMENTS



Weisart Floor Braced compartments finished in Baked Enamel offer clean, horizontal lines created by rigid flush stile construction. The Weis inset upper hinge permits doors and stiles to line up at top.

SPECIFICATIONS

GENERAL—Toilet compartments shall be Weisart Floor-Braced, as manufactured by the Henry Weis Manufacturing Company, Inc., Elkhart, Indiana. Partitions, doors and stiles shall be Weis flush construction. *Solid sub-floor, by others, recommended not more than 2" below finish floor for anchoring stiles.*

(NOTE) *Weis Hi-Stile (overhead braced) recommended for single alcove compartments.*

When specified, sub-floor stile anchor assemblies shall be provided by Weis for installation by contractor before finished floor is laid. See detail opposite page.

MATERIALS—Partitions, stiles and doors shall be bonderized galvanized, extra smooth finish. Partitions shall be 20 ga., doors 22 ga., stiles 16 ga., edge moldings 20 ga. Stile shoes, 4" wide and over, shall be stainless steel, 3" high. Stile shoes less than 4" wide shall be cast alloy. Brackets shall be cast alloy.

DESIGN—Doors shall be in alignment with tops of stiles, with no hardware extending above top line. Panels and doors shall be 1" thick, stiles 1¼" thick. Partitions, doors and stiles shall have double faced honeycomb cores cemented under pressure to inner metal surfaces. Face plates of doors and partitions shall have die formed corners and edges, the latter with flat, level, die formed welding segments, and shall be fused together at these segments to form a rigid one piece unit. Face plates of stiles shall have formed edges, welded together into a rigid unit. All edges shall be bound with interlocking trim molding. Stile molding shall be mitered and welded at corners. Partition and door molding shall be reinforced with die formed stainless steel corners. Wall and floor fastenings shall be adjustable.

FINISH—All material shall be thoroughly cleaned and given one coat of rust resisting synthetic primer, followed by synthetic enamel, baked at high temperatures. Brackets shall be enameled to match partitions. (Chromium plated brackets also available when specified.)

HARDWARE—Doors shall be hung on Weistyle concealed gravity hinges with stainless steel pintles, and actuated by opposed nylon cams in the lower hinge. Hinges shall be recessed in edge of door. Compartments with doors shall be fitted with combination keeper and bumper, slide bar latch and coat hook with rubber tipped bumper. Latches and coat hooks applied with theft resistant, one way screws. All hardware non-ferrous metal chromium plated.

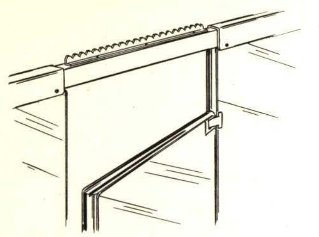
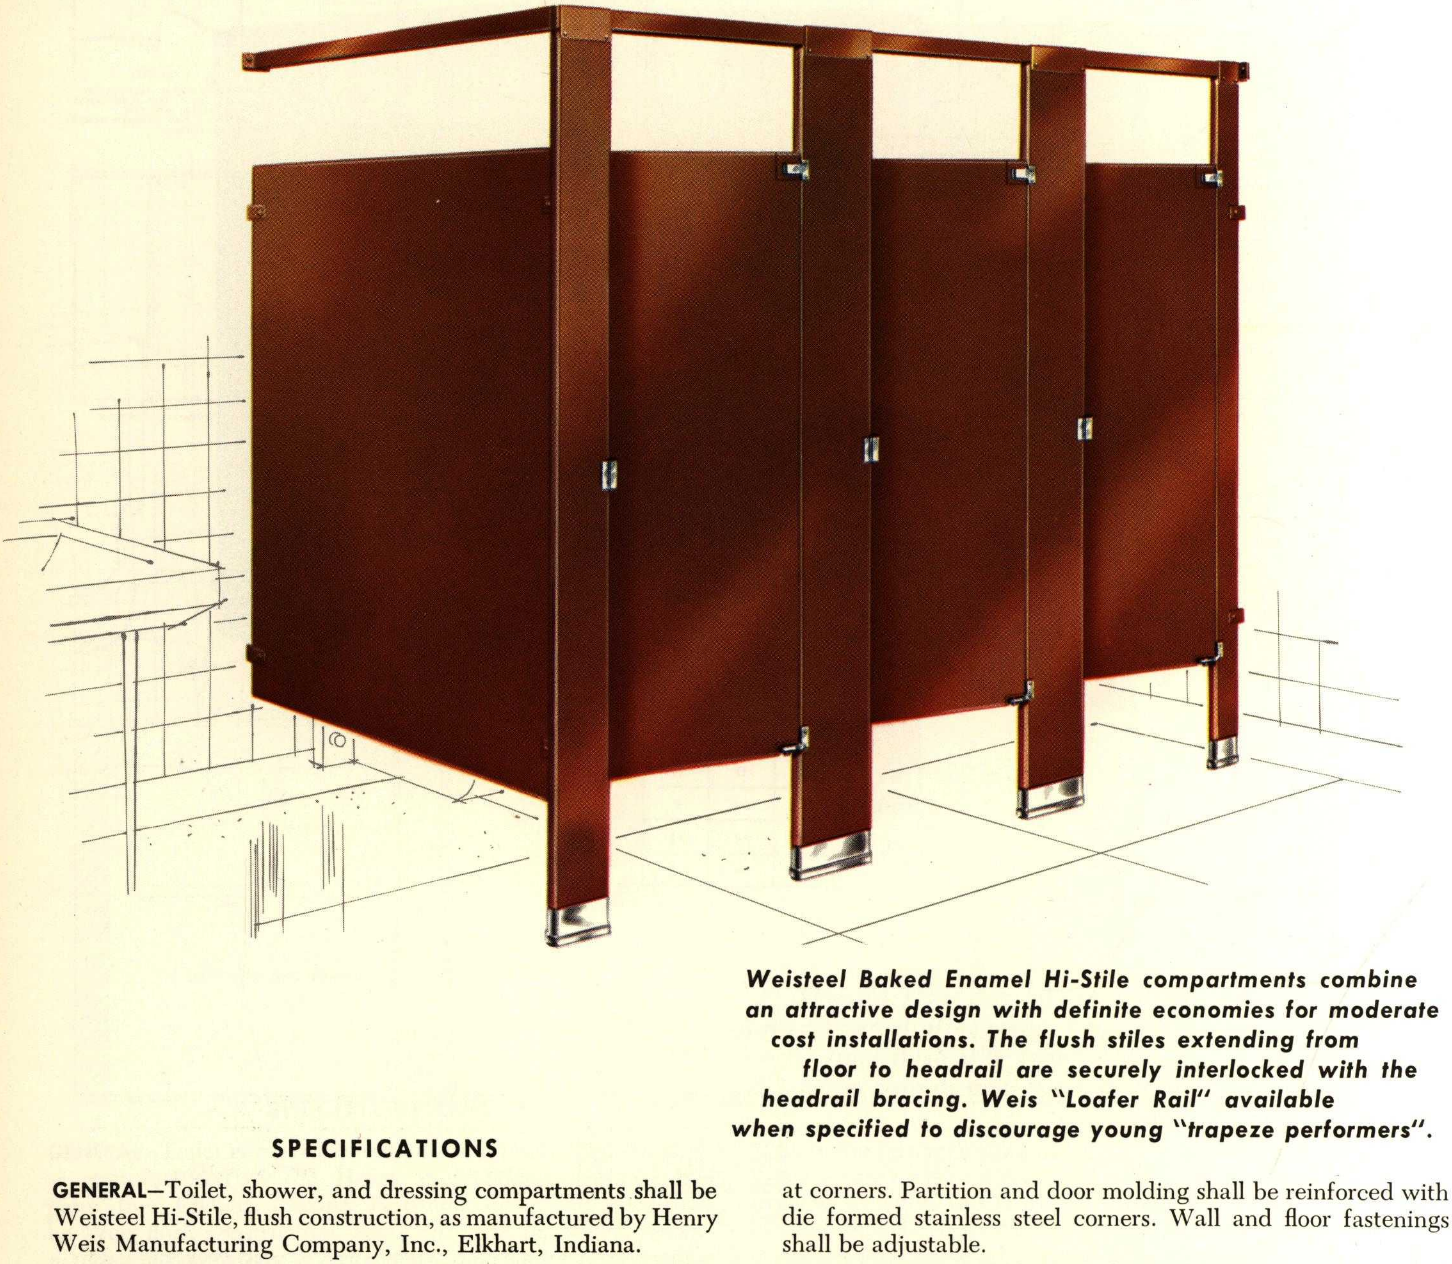
WEISTEEL

BAKED ENAMEL HI-STILE COMPARTMENTS





Weisteel Baked Enamel Hi-Stile compartments combine an attractive design with definite economies for moderate cost installations. The flush stiles extending from floor to headrail are securely interlocked with the headrail bracing. Weis "Loafer Rail" available when specified to discourage young "trapeze performers".

SPECIFICATIONS

GENERAL—Toilet, shower, and dressing compartments shall be Weisteel Hi-Stile, flush construction, as manufactured by Henry Weis Manufacturing Company, Inc., Elkhart, Indiana.

MATERIALS—Partitions, doors, stiles and headrail shall be bonderized galvanized, extra smooth finish. (Available in cold rolled steel.)* Partitions, stiles, headrail and edge molding shall be 20 ga., doors 22 ga. Headrail shall be 1¼"x1⅞" lock seam tubing. Stile shoes, 4" wide and over, shall be stainless steel, 3" high. Stile shoes less than 4" wide shall be cast alloy. Brackets shall be fabricated steel.

DESIGN—Panels and doors shall be 1" thick, stiles 1¼" thick. Partitions, doors and stiles shall have double faced honeycomb cores cemented under pressure to inner surfaces. Face plates of doors and partitions shall have die formed corners and edges, the latter with flat, level, die formed welding segments, and shall be fused together at these segments to form a rigid one piece unit. Face plates of stiles shall have formed edges, welded together into a rigid unit. All edges shall be bound with interlocking trim molding. Stile molding shall be mitered and welded at corners. Partition and door molding shall be reinforced with die formed stainless steel corners. Wall and floor fastenings shall be adjustable.

FINISH—All material shall be thoroughly cleaned and given a coat of rust resisting synthetic primer, followed by synthetic enamel, baked at high temperatures. Brackets shall be enameled to match partitions. (Chromium plated brackets also available when specified.)

HARDWARE—Doors shall be hung on Weistyle concealed gravity hinges, with stainless steel pintles, and actuated by opposed nylon cams in the lower hinge. Hinges shall be recessed in edge of door. Compartments with doors shall be fitted with combination keeper and bumper, slide bar latch and coat hook with rubber tipped bumper. Latches and coat hooks shall be applied with theft resistant, one way screws. All hardware non-ferrous metal chromium plated.

*Note: *All shower partitions, urinal screens and partitions adjacent to urinal fixtures furnished only in bonderized galvanized steel.*

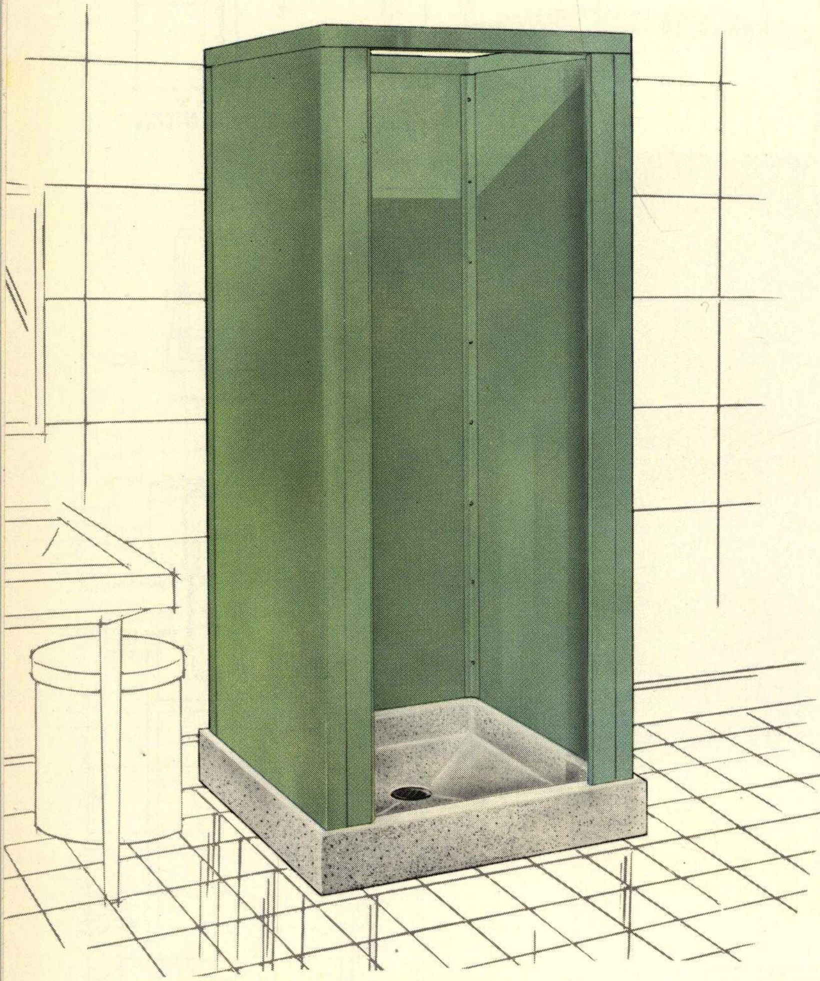
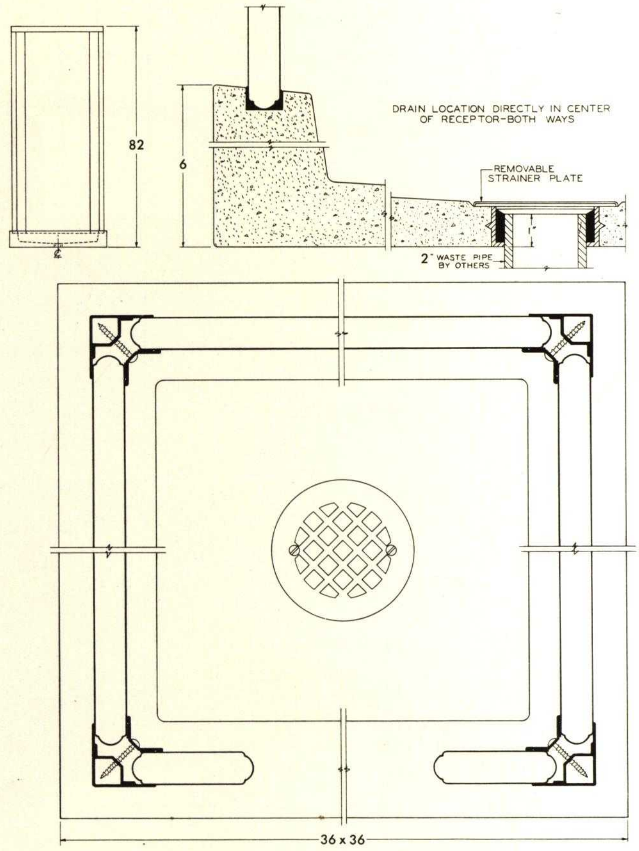
WEISHOWER





Weishowers are normally furnished on the same contract with toilet compartments and are finished in matching Weis colors. The one inch thick double wall construction is of the same design as toilet compartments and has a water-proof filler core.

WEISHOWER VITRE-STEEL (Porcelain Enamel)

GENERAL—Shower compartments shall be Weishower Vitre-Steel, as manufactured by Henry Weis Manufacturing Company, Inc., Elkhart, Indiana.

MATERIALS—Sides, backs and fronts shall be 18 gauge enameling iron, enameled in accordance with specifications of the Porcelain Enamel Institute, Inc., for acid resisting architectural porcelain enamel. Edge moldings shall be stainless steel. Receptors shall be precast terrazzo, consisting of white Portland cement and black and white marble chips. Waste outlet shall be cast brass for 2" iron pipe, complete with stainless steel removable strainer plate. Corner members shall be stainless steel, assembled with stainless steel screws. Curtain rod shall be chrome plated brass.

DESIGN—Sides, backs and fronts shall be 1" thick, matching the flush design and construction of Weisart Vitre-Steel compartments. Units shall have plastic sized water-proof, double faced honeycomb cores, cemented under pressure to inner surfaces. Face plates shall have die formed corners and edges, the latter with flat, level, die formed welding segments, and shall be fused together at these segments to form a rigid one-piece unit. All edges shall be bound with interlocking trim molding. Walls shall extend 76" above receptor. Receptors shall be 32" x 32" or 36" x 36".

FINISH—All surfaces, concealed and exposed, shall receive a vitreous porcelain enamel ground coat. All exposed surfaces shall receive a cover coat in color selected from the Weis color chart.

HARDWARE—Curtain rods included. Valves, heads, soap dishes, doors or curtains, mastic caulking, and similar accessories shall be supplied *by others*. Specify if walls to be drilled for valves and shower head.

WEISHOWER BAKED ENAMEL

GENERAL—Shower compartments shall be Weishower with baked enamel finish, as manufactured by Henry Weis Manufacturing Co., Inc., Elkhart, Indiana.

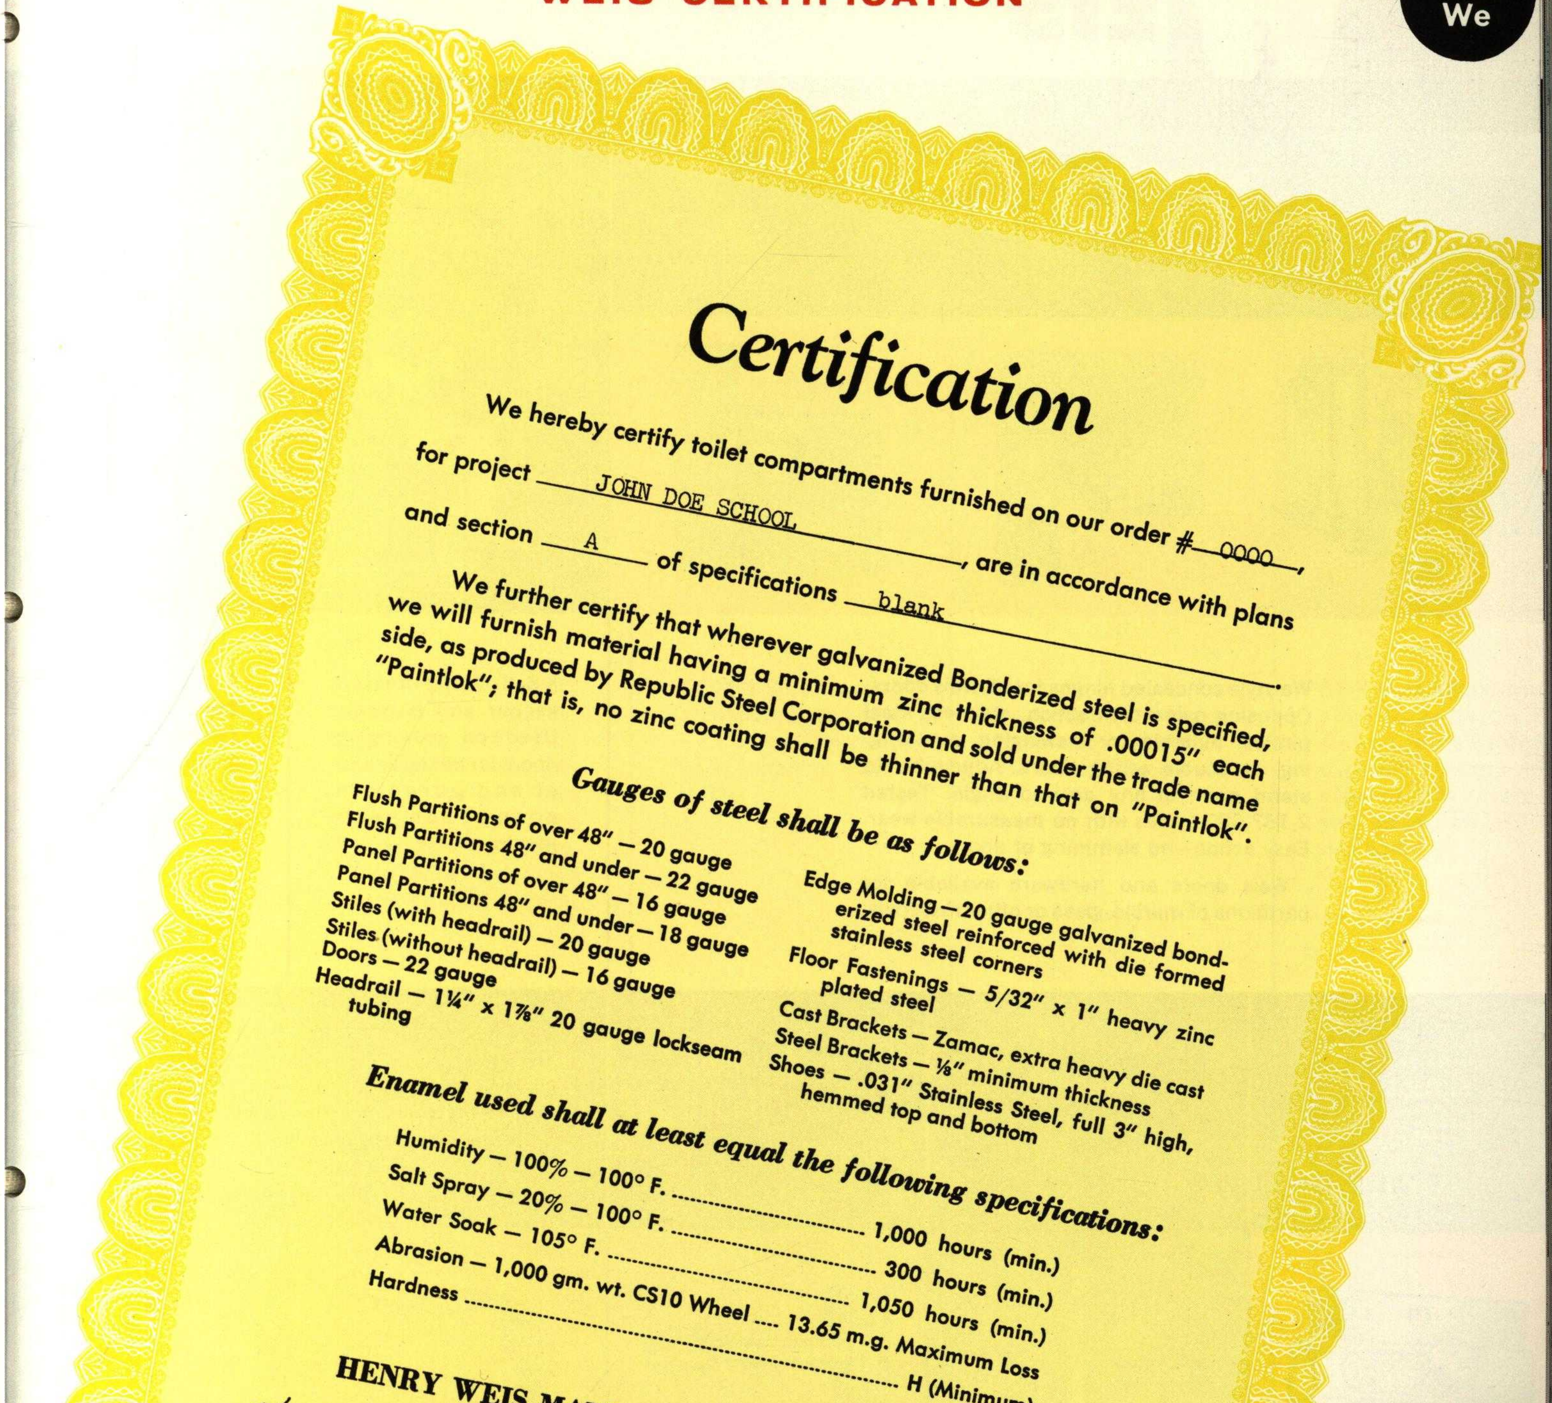
MATERIALS—Sides, backs, fronts, and moldings shall be 20 gauge extra smooth stretcher leveled galvanized bonderized steel. Receptors shall be precast terrazzo, consisting of white Portland cement and black and white marble chips, with cast brass waste outlet for 2" pipe, complete with stainless steel removable strainer plate. Corner members shall be stainless steel, enameled to match walls, assembled with stainless steel screws. Curtain rod shall be chrome plated brass.

DESIGN—Sides, backs and fronts shall be 1" thick, matching the flush design and construction of Weisart compartments. Units shall have plastic sized water-proof, double faced honeycomb cores, cemented under pressure to inner surfaces. Face plates shall have die formed corners and edges, the latter with flat, level, die formed welding segments, and shall be fused together at the segments to form a rigid one-piece unit. All edges shall be bound with interlocking trim molding. Walls shall extend 76" above receptor. Receptors shall be 32" x 32" or 36" x 36".

FINISH—All material shall be thoroughly cleaned and given one coat of rust resisting primer, followed by synthetic enamel, baked at high temperatures. Color to be selected from Weis color chart.

HARDWARE—Curtain rods included. Valves, heads, soap dishes, doors or curtains, mastic caulking, and similar accessories shall be supplied *by others*. Specify if walls to be drilled for valves and shower head.

WEIS CERTIFICATION



Certification

We hereby certify toilet compartments furnished on our order # 0000, for project JOHN DOE SCHOOL, are in accordance with plans and section A of specifications blank.

We further certify that wherever galvanized Bonderized steel is specified, we will furnish material having a minimum zinc thickness of .00015" each side, as produced by Republic Steel Corporation and sold under the trade name "Paintlok"; that is, no zinc coating shall be thinner than that on "Paintlok".

Gauges of steel shall be as follows:

Flush Partitions of over 48" — 20 gauge
Flush Partitions 48" and under — 22 gauge
Panel Partitions of over 48" — 16 gauge
Panel Partitions 48" and under — 18 gauge
Stiles (with headrail) — 20 gauge
Stiles (without headrail) — 16 gauge
Doors — 22 gauge
Headrail — 1¼" x 1⅞" 20 gauge lockseam tubing

Edge Molding — 20 gauge galvanized bonderized steel reinforced with die formed stainless steel corners
Floor Fastenings — 5/32" x 1" heavy zinc plated steel
Cast Brackets — Zamac, extra heavy die cast
Steel Brackets — ⅛" minimum thickness
Shoes — .031" Stainless Steel, full 3" high, hemmed top and bottom

Enamel used shall at least equal the following specifications:

Humidity — 100% — 100° F.	1,000 hours (min.)
Salt Spray — 20% — 100° F.	300 hours (min.)
Water Soak — 105° F.	1,050 hours (min.)
Abrasion — 1,000 gm. wt. CS10 Wheel	13.65 m.g. Maximum Loss
Hardness	H (Minimum)

HENRY WEIS MANUFACTURING COMPANY, INC.

Kester Mc Cubbin
President

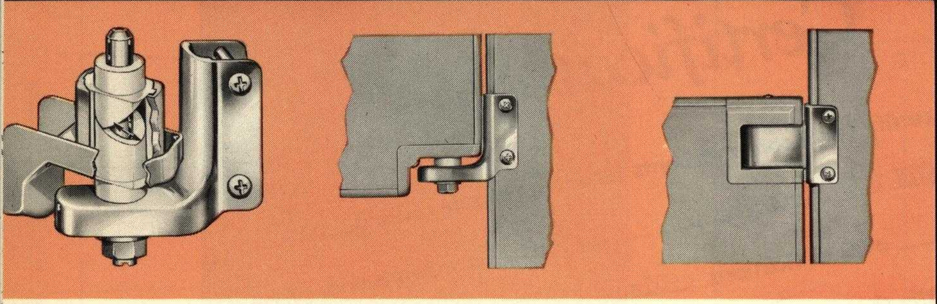
A. F. Baum
Secretary

Certification will be furnished on request.

Confidence in Weis products among architects, engineers and contractors stems from a long history of manufacturing that goes back more than three-quarters of a century. Weis originated the metal toilet compartment and over the years the names Weisteel and Weisart have earned a deserving reputation in this specialized field.

WEIS hardware

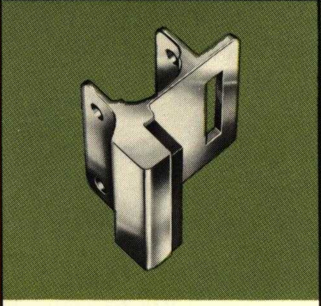
concealed lower hinge and upper hinge



Weistyle concealed hinges for all Weis doors. Opposing nylon cam action, stainless steel pintles. Suitable for inswinging, outswinging, or double acting doors. Adjustable to stand open at any desired angle. Tested 2,187,000 cycles with no measurable wear. Easy action—no slamming of door.

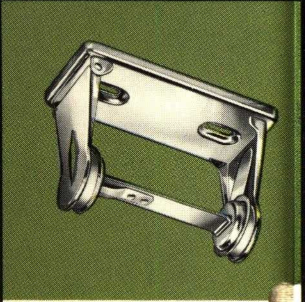
Weis doors and hardware available for partitions of marble, glass or other materials.

combination keeper and bumper



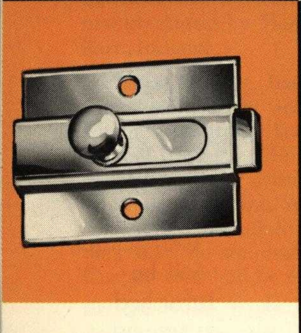
KB-6 Combination keeper and bumper. Used on inswinging doors for baked enamel and porcelain enamel compartments.

roll paper holder



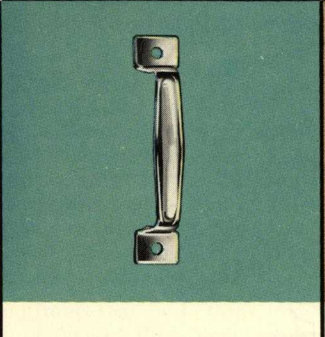
E-152 Grif-Ho R-200 Steel chromium plated roll paper holder, self-locking type.

slide bar latch



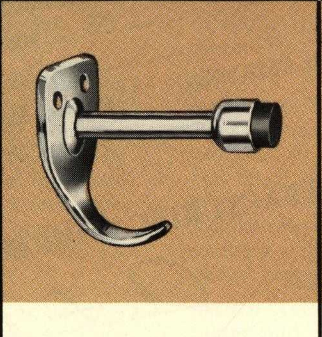
LL-1 Slide Bar Latch, brass, chromium plated with concealed spring plate eliminating rattle of latch bar. Attached with one way slot screws.

door pull



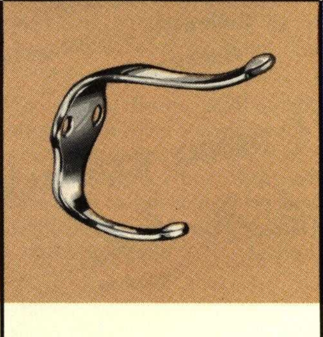
C-28 Door Pull, brass, chromium plated. Furnished for outswinging doors, also entry doors. Attached with one way slot screws.

combination coat hook and bumper



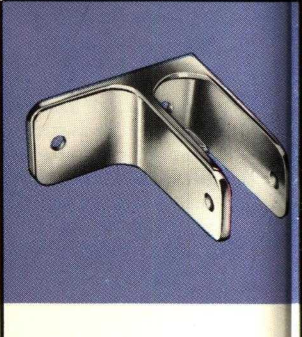
C-110-2 Combination coat hook and bumper. Brass, chromium plated, for inswinging doors. Attached with one way slot screws.

two-prong coat hook



B-35 2-prong coat hook. Brass, chromium plated. For outswinging doors, also for compartments without doors.

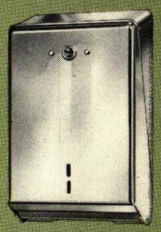
one-eared cast bracket



WB-151 for stile
WB-141 for partition
WB-142 partition to stile at corner. Chromium plated or enameled.

and accessories

cabinet paper holder



E-149 Government #438 Steel chromium plated cabinet paper holder for single or double fold tissue.

stile shoe

FF-31 Cast alloy chromium plated stile shoe. For free standing floor braced urinal shields with 3″ front stile. Also for 3″ stiles from floor to ceiling. Two floor fastenings (one at each edge of stile).

stile shoe

FF-30 Cast alloy chromium plated shoe for 3″ stiles. Concealed floor fastening inside fitting.

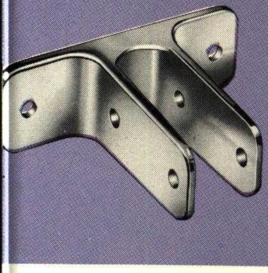
stile shoe

FF-4 through FF-12 Polished stainless steel stile shoe 3″ high for stiles 4″ and over in width.

jiffy-joiner

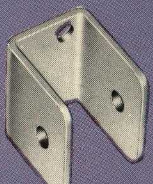
RS-7 Aluminum extrusion to provide a closed joint where partition attaches to edge of stile. Enameled to match partition and stile.

two-eared cast bracket



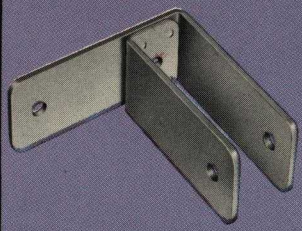
WB-131 partition to wall.
WB-132 partition to stile. Chromium plated or enameled.

partition-to-stile bracket, steel



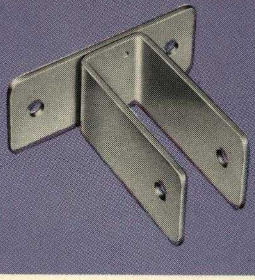
WB-10 Partition to stile bracket for Hi-Stile compartments, enameled.

one-eared wall bracket, steel



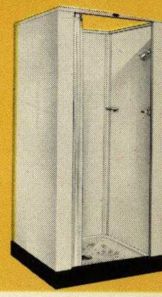
WB-9-3 for partition, enameled.
WB-12-3 for stile, enameled.

two-eared wall bracket, steel



WB-8-3 for partition, enameled.
WB-11-2 for stile or wall post, enameled.

cabinet showers



Weisway Cabinet Showers in a wide range of models and sizes. For home, industrial and institutional installations. Write for complete information.

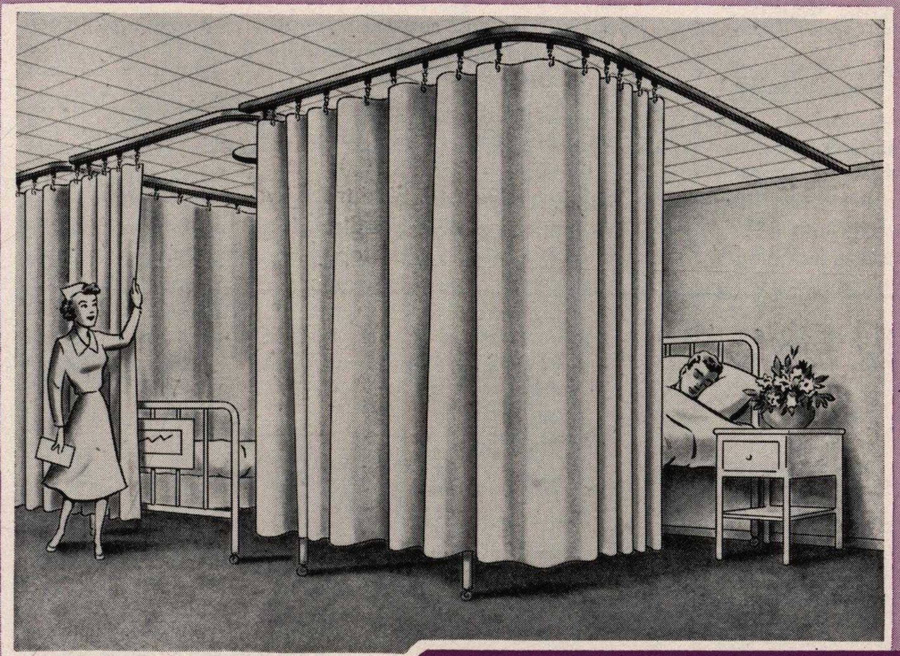
LITHO IN U.S.

the new cubicle curtain track

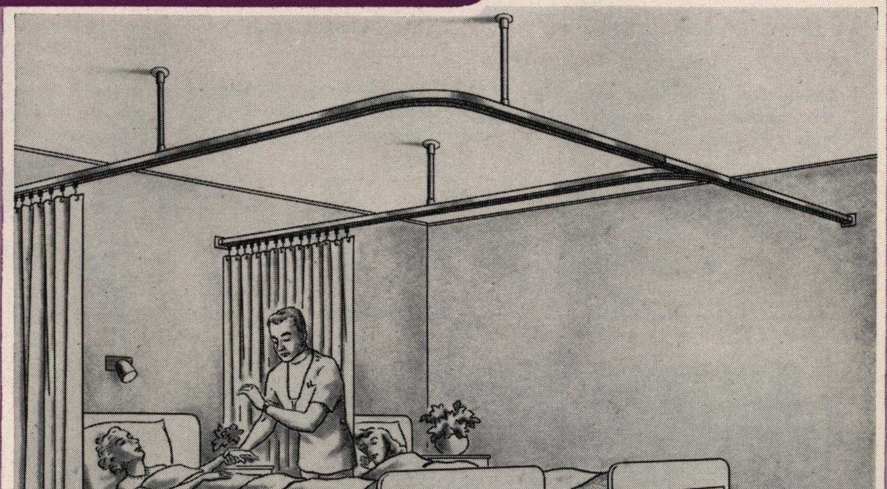


designed by the world's largest and best-known manufacturer of stage and drapery hardware.

◀ ceiling type

cubi-trac

suspended type ▶



for hospitals, physicians' offices, nursing homes, dressing rooms and private residences.

A.I.A. File No. 35-K

SOLD ONLY THROUGH DEALERS - -

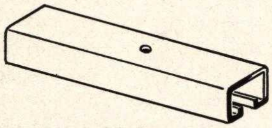
ADC DRAPERY TRACK CORP.
2121 SOUTH 12th STREET
ALLENTOWN, PENNSYLVANIA

OUR CREDO

Since 1919 the name "ADC" has been synonymous with quality products, smooth and efficient operation, and prompt and courteous service. Each job is custom-made and is therefore given individual attention. Our products are sold only through dealers and we are proud to be associated with this closely-knit family. Their continuing loyalty to "ADC" is probably the biggest single reason why we today enjoy the position of being the nation's leading manufacturer of stage and drapery hardware.

OUTSTANDING *cubi-trac* FEATURES

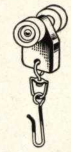
- Carrier wheels made of sturdy polyethylene to assure noiseless curtain travel and long life.
- "Bumper-to-bumper" action with specially designed center block that prevents wheels of one carrier from binding contact with next carrier.
- Rust-proof swivel attachment to assure free swinging movement of carrier.
- Sturdy abrasion-resistant, high strength, high impact, plastic block with heavy duty swivel attachment preventing separation of curtain from carrier. A substantial improvement over frangible bead-chain arrangements.
- Perfectly formed 90-degree 12″ radius curves including at least 12 inches of continuous, unspliced straight channel at each end.
- Only cubicle track on the market that can be used for both ceiling and suspended types. An exclusive interchangeable feature offered only by ADC! Truly, the all-purpose cubicle track.
- Each Joining Sleeve and T-Bracket eliminates need for one Suspension Tube. (Used only on suspended installations.)
- Easily the quietest cubicle track available anywhere.
- Carriers can easily be replaced in track channel through use of Removable End Stop.



No. 1100 Channel

1′—5 oz.

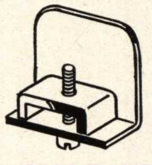
14 gauge aluminum. Obtainable in unspliced lengths up to 20′. Holes drilled on 12″ spacing on top of channel for direct ceiling attachment. App. 1″ x 1⅛″.



No. 1101 Single Carrier

2—1 oz.

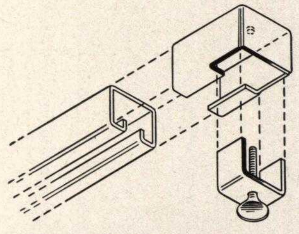
Rec. spacing: 6″.
Block providing "bumper-to-bumper" action, supported from 2 polyethylene wheels. Plated swivel and curtain hook for free, effortless and quiet curtain movement. Carrier width: app. 13/16″.



No. 1109 End Stop

2—1 oz.

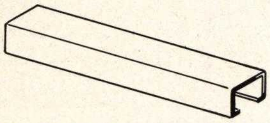
Prevents carriers from slipping out of end of track.



No. 1110 Removable End Stop

1—3 oz.

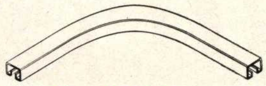
Permits easy replacement of carriers at one track end by simple pull-out device. End Stop prevents carriers from slipping out of end of track. End Stop width: app. 1″.



No. 1124 Splicing Clamp

1—2 oz.

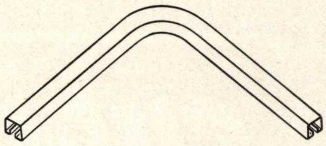
Sleeve for joining and extending track sections. 8″ long x 1¼″ wide x 1″ high.



No. 1167 Curve

1—17 oz.

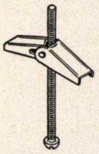
44″ long piece bent to 90 degree 12″ radius with 12″ straight channel at each end.



No. 1168 Curve

1—31 oz.

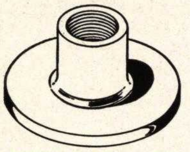
78″ long piece bent to 90 degree, 12″ radius with 24″ straight channel at each end. Especially designed for relatively short spans such as dressing room enclosures. Embraces area up to 3′ x 3′.



No. 1169 Toggle Bolt

2—1 oz.

For attaching track channel direct to ceiling and for fastening Ceiling and Wall Flanges. 3/16″ x 3″ recommended.



No. 1170 Ceiling Flange

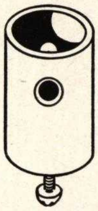
1—4 oz.

Threaded accessory constructed of heavy-duty aluminum. For connecting Suspension Tube to ceiling. Toggle bolt rec. to attach Flange to ceiling.

No. 1171 Suspension Tube

1′—5½ oz.

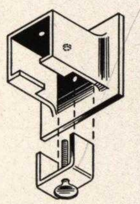
Rec. spacing: 6′.
Constructed of 15/16″ aluminum. Threaded at one end for fastening to Ceiling Flange. Other end fastened to Track Socket.



No. 1172 Track Socket

1—1 oz.

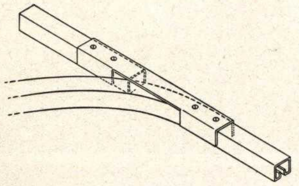
Constructed of heavy duty aluminum. Connects Suspension Tube to track channel with screw.



No. 1173 Wall Flange

1—2½ oz.

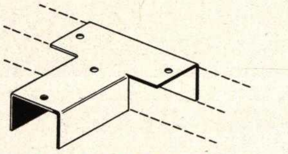
Constructed of heavy duty aluminum. For fastening track channel to wall with toggle bolt. End Stop Insert permits easy replacement of carriers on suspended installations.



No. 1174 Joining Sleeve

1—8 oz.

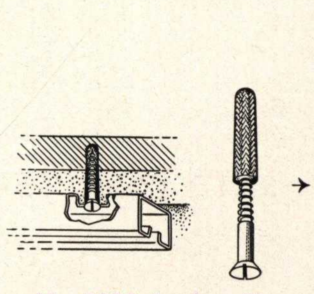
Constructed of aluminum. Connects straight section of one track with curved section of adjoining track. Provides added track support.



No. 1175 T-Bracket

1—3 oz.

Joins 2 tracks into 90-degree connection. Provides added track support.



No. 1180 Anchor Plug

64—1 oz.

Composed of braided jute compressed into tubular shape. Eliminates preliminary marking and hole spotting during attachment of track channel direct to concrete ceilings. Metal or wood screw with Anchor Plug inserted as one unit. Holding power far in excess of ordinary requirements. Hole size same diameter and length as Anchor Plug. For ceiling type installation only. ⅝″ #8 recommended.

ECONOMICALLY PRICED • REMARKABLY QUIET AND SMOOTH

Suggested Specifications for Ceiling-Type Cubi-Trac

Cubicle Tracks shall be of aluminum construction, entirely enclosed, except for slot in bottom, and in one continuous piece. Cubicle carriers shall be spaced six inches apart and shall be composed of a special non-wheel binding abrasion-resistant block supported on self-lubricating bearings by two polyethylene wheels, rolling on two separate parallel treads. Each cubicle carrier shall also consist of a free-moving rust-proof swivel and rust-proof curtain hook. One end of each track unit shall be equipped with a removable type end stop to permit simple replacement of carriers. Splicing clamps shall be of aluminum construction and shall extend and join track sections. Curves shall be formed to 12″ radius, 90 degrees with at least 12 inches of straight channel at each end. Model 110 as manufactured by ADC Drapery Track Corporation of Allentown, Pa.
